2E	Coordinate with theater-specific and 363 ISRW targeteers for full understanding of your target and assessments.		**X**			
2F	Become familiar with different theaters to widen your expertise.			**X**		
2G	Continually balance timely notification to decision makers in support of operations against more in-depth and deliberate analysis/assessments.				**X**	
Chp 3	**IC and other Military Service Capabilities**	**DI**	**AS**	**EX**	**AN**	**DE**
3A	Gain Joint experience at a regional JIOC for improved & integrated analysis.			**X**	X	
3B	Seek out assignments in or deployments to an operational AOR to deepen and broaden your analysis expertise.			**X**	X	

3C	Be aware of U.S. military and theater capabilities and those of coalitions to enhance your analysis.			**X**		
3D	Prepare for future operations in a communications-contested environment; use/build resident capabilities prior to any deployment or operation.	x	x	x	**X**	x
3E	Enhance your Open-Source Intelligence (OSINT) expertise and understanding of IC-wide OSINT capabilities and organizations to leverage during crisis operations and to enhance your analytic prowess.	**X**				
3F	Improve your network with special operations ISR personnel for enhanced interface in-theater.		**X**	x	X	
Chp 5	**Analysis Skills and Tradecraft**	**DI**	**AS**	**EX**	**AN**	**DE**
5A	Leverage IC and joint programs that train, develop, and/or equip analysts to properly use tradecraft and provide better analysis.	x	x	**X**	X	x
5B	Participate in AF and Joint exercises to help sharpen analytic and joint awareness skills prior to an operational deployment.		x	**X**	X	
5C	Expand expertise and analytic skills beyond traditional warfare constructs to also be familiar with irregular warfare and non-traditional enemies.	**X**	x	x		
5D	Develop a network for improved collaboration/Red Teaming in different theaters.		x	**X**	X	
5E	Leverage theater and target-specific linguists as a good source to Red Team analysis, especially given adversary insights.		x	**X**	X	
5F	Leverage expertise and skills from multiple disciplines including scientists, engineers, space and cyber professionals, meteorologists, and the medical community for effective intelligence analysis.	x	x	**X**	X	
5G	Understand knowledge management, data science, and big data analytic concepts and principles for improved data aggregation.			**X**	X	
5H	Don't become influenced/infatuated with a particular sensor or source; cross-reference/check with multiple sources.	**X**				
Chp 6	**Analysis Requirements and Production**	**DI**	**AS**	**EX**	**AN**	**DE**
6A	Educate customers on AF ISR capabilities so they can help provide the best analysis possible to meet existing requirements.					**X**
6B	Understand what products are currently available and who is already working on/analyzing similar requirements to ensure unity of purpose and avoid duplication of effort.	**X**				
6C	Understand basic acquisition-/IMD-related intelligence requirements to help better align assessments in support		**X**			

	of respective customers.					
6D	Prepare now for the operations and warfare of tomorrow; expect contingency operations to occur in your area of analytic expertise and pre-plan against your analytic target with pre-positioned RFIs, target identification, etc.	x			**X**	
6E	Coordinate/interface often with resident collection managers on assessments and proposed collection strategies.	x	**X**		X	
6F	Enhance your ability to assess risks associated with commander estimates and plans (e.g., operational plans, contingency plans, etc.) for improved utility and interface with traditional operations.		**X**			
6G	Always consider the commander's intent, end state, definition of success, and the potential adversary centers of gravity when performing analysis.			x	**X**	
6H	Develop the analysis/assessment then take a final "step back" to review again from a strategic mindset and perspective.		x	**X**		
6I	Strive to produce assessments that are releasable and only make products/services “Not Releaseable to Foreign Nationals (NOFORN)” or caveated when required.					**X**

Notes:
1. The list is not intended to be comprehensive or all inclusive, nor is it intended to serve as a checklist that analyst Airmen are expected to meet. The aim is for analyst Airmen and analysis organizations across the AF to refine and expand the list over time.
2. Key sources for the lessons learned in this table include subject matter experts, various AF/A2 reviews of intelligence analysis, and a study by RAND Corporation: Brien Alkire, et al., *Leveraging the Past to Prepare for the Future of Air Force Intelligence Analysis*, RR-1330-AF.

A3.2. Some of the intelligence analysis lessons in Table A3.1 have been formally documented in some form or fashion via the AF Lessons Learned (LL) Program (AFLLP). The AFLLP exists to enhance readiness and improve combat capability by capitalizing on the experiences of Airmen and organizations. A lesson learned is an observation that, when validated and resolved, results in an improvement in military operations or activities at the strategic, operational, or tactical level and in long-term, internalized change to an individual or an organization. The AFLLP is part of the larger Joint Lessons Learned Program (JLLP). The Joint LL Information System (JLLIS) is used to track and disseminate LLs throughout the AF, DoD, and IC. JLLIS allows AF personnel to search, submit, and manage all AF Observations, Lessons Identified, After Action Reports, LLs, and other information up to TOP SECRET/Sensitive Compartmented Information (TS/SCI). The JLLIS database is located at SIPRNet Caution-url: **https://www.jllis.smil.mil**. All analyst Airmen are encouraged to register in JLLIS and enter observations that contain potential lessons into JLLIS for coordination through the AFLLP and/or inform their local chain of command as appropriate.

A3.3. In addition, several MAJCOMs actively acquire lessons learned or best practices. For example, HQ ACC/A2OO (Weapons and Tactics) has established a program to capture lessons learned, TTPs, and experience from ISR professionals returning from deployments.

Attachment 4

SAMPLE STANDARDS EVALUATION METHODOLOGY

A4.1. IAW AFI 14-133, MAJCOM/A2s and the NASIC/CC are responsible for developing a means to annually measure and assess AF intelligence analysis standards via SACs for reporting in the MICT. In addition, the DNI requires the AF to annually evaluate specified "covered products" for compliance with IC standards. Table A4.1, *IC Product Evaluation Criteria and Rating Scales*, delineates IC analytic tradecraft standards for use in assessment and "covered product" evaluations. The JWICS Advanced Global Intelligence Learning Environment (AGILE) offers computer-based training on how to conduct product evaluations. It is important to note that while AF tradecraft standards align with IC standards, the AF evaluates two additional standards: timeliness and customer engagement. Table A4.2, *Sample Tradecraft Criteria for Timeliness*, and Table A4.3, *Sample Tradecraft Criteria for Customer Engagement*, offer considerations for self-assessment on these two additional AF standards.

Table A4.1. IC Product Evaluation Criteria and Rating Scales.

Reviewer		Objective	1. Yes	2. No
Date of Review		Independent of political consideration	☐ Yes	☐ No
Product Name		Timely	☐ Yes	☐ No
Product ID Number		Based on all available sources of intelligence	☐ Yes	☐ No

1. Properly describes quality and credibility of underlying sources, data, and methodologies			
☐ Poor (0)	☐ Fair (1)	☐ Good (2)	☐ Excellent (3)
☐ Largely lacks sourcing or describes reporting base, data, or methodologies only vaguely; **OR** ☐ Misidentifies or misrepresents cited reporting, data, or methodologies.	☐ Contains basic, generic descriptions of cited reporting, data, or methodologies; **BUT** ☐ Provides little detail on factors that may affect the quality and credibility of underlying sources, data, or methodologies.	☐ Contains at least basic, generic descriptions of cited reporting, data, or methodologies; **AND** ☐ Provides considerable detail on factors that may affect the quality and credibility of underlying sources, data, or methodologies.	☐ Satisfies "good" criteria; **AND** 1. Identifies which sources are most important to major analytic judgments; **OR** ☐ Provides additional detail about sources, data, or methodologies that provides insight into their contribution to the analysis.
Comment:			

2. Properly expresses and explains uncertainties associated with major analytic judgments			
☐ Poor (0)	☐ Fair (1)	☐ Good (2)	☐ Excellent (3)
☐ Does not indicate levels of uncertainty associated with major analytic judgments; **OR** ☐ Indicates levels of uncertainty associated with major analytic judgments that are inconsistent with the basis ascribed to them.	☐ Indicates levels of uncertainty associated with major analytic judgments; **BUT** ☐ Does not explain their basis (e.g., by reference to strengths and weaknesses of the information base, contrary reporting, assumptions, or the nature of the judgment).	☐ Indicates levels of uncertainty associated with major analytic judgments; **AND** ☐ Explains their basis (e.g., by reference to strengths and weaknesses of the information base, contrary reporting, assumptions, or the nature of the judgment).	☐ Satisfies "good" criteria; **AND** **1.** Provides especially thorough discussion of nature and sources of uncertainties affecting major analytic judgments; **OR** ☐ Identifies indicators that, if detected, would alter levels of uncertainty associated with major analytic judgments.
Comment:			

3. Properly distinguishes between underlying intelligence information and analysts' assumptions and judgments			
☐ Poor (0)	☐ Fair (1)	☐ Good (2)	☐ Excellent (3)

☐ Does not distinguish among statements that convey underlying information, assumptions, and judgments.	☐ Sometimes distinguishes among statements that convey underlying information, assumptions, and judgments; **OR** ☐ Does not explicitly state assumptions that serve as linchpins of an argument or bridge key information gaps.	☐ Consistently distinguishes among statements that convey underlying information, assumptions, and judgments; **AND** ☐ Explicitly states assumptions that serve as linchpins of an argument or bridge key information gaps.	☐ Satisfies "good" criteria; **AND** 1. Identifies indicators that, if detected, could validate or refute judgments or assumptions; **OR** ☐ Explains the implications for judgments if assumptions are incorrect.
Comment:			
4. Incorporates alternative analysis			
☐ Poor (0)	☐ Fair (1)	☐ Good (2)	☐ Excellent (3)
☐ Does not present alternatives when uncertainties, complexity, or low probability / high impact situations warrant their inclusion.	☐ Presents alternatives when uncertainties, complexity, or low probability / high impact situations warrant their inclusion; **BUT** ☐ Does not explain the evidence and reasoning that underpin them or discuss their likelihood or implications related to U.S. interests.	☐ Presents alternatives when uncertainties, complexity, or low probability / high impact situations warrant their inclusion; **AND** ☐ Explains the evidence and reasoning that underpin them; **AND** ☐ (c) Discusses their likelihood or implications related to U.S. interests.	☐ Satisfies "good" criteria; **AND** ☐ Identifies indicators that, if detected, would affect the likelihood of any identified alternatives.
Comment:			
5. Demonstrates customer relevance and addresses implications			
☐ Poor (0)	☐ Fair (1)	☐ Good (2)	☐ Excellent (3)
☐ Provides little or no information or analysis beyond what is generally known; **OR** ☐ Does not respond adequately to a specific tasking.	☐ Provides useful information and analysis but does not address implications; **OR** ☐ Does not address an important issue or question raised by the analysis; **OR** ☐ Satisfies a specific tasking only partially.	☐ Provides useful information and analysis and addresses near-term, direct, or first-order implications; **AND** ☐ Adds value by addressing at least one of the following: trends or prospects, appropriate context, insight gained from synthesizing a large volume of information, warning of threats to U.S. interests, or factors affecting opportunities for U.S. actions (without prescribing U.S. policy); **OR** ☐ Satisfies a specific tasking fully.	☐ Satisfies "good" criteria; **AND** ☐ Assesses longer-term, indirect, or second-order implications; **OR** ☐ Provides exceptionally expert analysis (e.g., by drawing on multiple disciplines or presenting illuminating comparisons); **OR** ☐ Warns of threats in detail (e.g., by discussing specific indicators, likelihood, or imminence); **OR** ☐ Analyzes in detail factors affecting opportunities for U.S. action (e.g., by discussing risks, benefits, or possible reactions to potential U.S. actions).
Comment:			
6. Uses clear and logical argumentation			
☐ Poor (0)	☐ Fair (1)	☐ Good (2)	☐ Excellent (3)
☐ Lacks a main analytic message; **OR** ☐ Does not support analytic judgments with relevant evidence or undermines them by using flawed logic; **OR**	☐ Presents a main analytic message; **BUT** ☐ Does not combine evidence, context, and assumptions effectively to support analytic judgments or uses weak logic; **OR**	☐ Presents a prominent and clear main analytic message; **AND** ☐ Presents clear reasoning with no flaws in logic and effectively combines evidence, context, and	☐ Satisfies "good" criteria; **AND** ☐ Addresses any inconsistent or contrary information in a way that reconciles it with analytic judgments; **OR** ☐ Demonstrates notable skill or sophistication in combining evidence, context, and assumptions convincingly to

☐ Often uses unclear language or uses a structure that is not easily understood.	☐ Sometimes uses unclear language or a structure that at times is not easily understood.	assumptions to support analytic judgments; **AND** ☐ Uses clear language and a structure that displays a logical flow appropriate for the argument being presented.	support analytic judgments.
Comment:			

7. Explains change to or consistency of analytic judgments			
☐ Poor (0)	☐ Fair (1)	☐ Good (2)	☐ Excellent (3)
☐ Does not note or explain that a major analytic judgment differs from previous production.	☐ Does not note that a major analytic judgment is consistent with previous production; **OR** ☐ Notes how a major analytic judgment compares with previous production but does not explain how new information or reasoning supports changing or maintaining an existing analytic line.	☐ Notes how a major analytic judgment compares with previous production and explains how new information or reasoning supports changing or maintaining an existing analytic line.	☐ Satisfies "good" criteria; **AND** ☐ Highlights and explains how a major analytic judgment compares with judgments on the topic held within the U.S. intelligence community, not just within the same analytic element.
Comment:			

8. Makes accurate judgments and assessments			**Harvest Date:**		
Phase 1			**Phase 2:** Often accuracy cannot be evaluated until a later date. Establish a "harvest" date to revisit the assessment to evaluate Phase 2.		
☐ Unclear	☐ Conditioned	☐ Unconditioned	☐ Accurate	☐ No Accurate	☐ Indeterminate
☐ Judgment or assessment is not expressed clearly.	☐ Judgment or assessment is expressed clearly and is conditioned (e.g., by an "if/then" statement).	☐ Judgment or assessment is expressed clearly and is not conditioned (e.g., by an "if/then" statement).	☐ Judgment or assessment is found to be accurate.	☐ Judgment or assessment is found to be not accurate.	Accuracy could not be determined for any of several reasons: ☐ Nature of judgment or assessment prevented assessment of accuracy. ☐ Data needed to assess accuracy were not found. ☐ Irreconcilable views among evaluators prevented agreement on a final assessment of accuracy.
Comment:					

9. Incorporates effective visual information where appropriate			
☐ Poor (0)	☐ Fair (1)	☐ Good (2)	☐ Excellent (3)
☐ Does not use visual information when its use would have substantially complemented or enhanced an analytic product; **OR** ☐ Presents visual information that is inconsistent with or not pertinent to the text of an analytic product, or that confuses or detracts from an analytic product's presentation.	☐ Presents visual information that is pertinent to an analytic product; **BUT** ☐ Does little to clarify (illustrate, summarize, or provide greater detail), complement, or augment data or analytic points in an effective manner that enhances customer understanding of a product's analysis.	☐ Presents visual information that is pertinent to an analytic product; **AND** ☐ Clarifies (illustrates, summarizes, or provides greater detail), complements, or augments data or analytic points in an effective manner that enhances customer understanding of a product's analysis.	☐ Satisfies "good" criteria; **AND** ☐ Takes particularly effective advantage of visual presentational methods to convey data or analytic points in a way that enhances a product's value by making complex issues more understandable, adding insight or perspective, increasing knowledge retention, or highlighting trends, drivers, or indicators.
Comment:			

General Comments:
If an evaluator determines that a standard is **not applicable**, *it should be noted, with a justification, in the comment box.*

Table A4.2. Sample Tradecraft Criteria for Timeliness.

1. Poor (0)	2. Fair (1)	3. Good (2)	4. Excellent (3)
5. ISR element fails to provide analysis products and services in sufficient time to impact planning, operations, and decision-making	6. ISR element timeliness in providing analysis products and services marginally impacts planning, operations and decision-making	7. ISR element provides analysis products and services in sufficient time to impact planning, operations, and decision-making	8. ISR element provides analysis products and services at the earliest time and place to enable decision advantage and create significant mission and capability opportunities
Comment:			
Note: AF intelligence analysis is timely to impact planning, mission objectives, operations and to otherwise aid in commanders' decisions. Analysts are responsible for engaging with customers and end-users of intelligence to understand what they need and when they need it in order to deliver information and knowledge at the earliest time and place to enable customers to effectively make decisions and take action. Timeliness is about ensuring awareness, creating opportunities, and enabling warfighting decision advantage.			

Table A4.3. Sample Tradecraft Criteria for Customer Engagement.

1. Poor (0)	2. Fair (1)	3. Good (2)	4. Excellent (3)
1. ISR element has limited engagement with the customer to understand their requirements or seek feedback on product/service timeliness or utility	2. ISR element requests and responds to customer feedback for some, but not all, products and services	3. ISR element requests and responds to customer feedback for all products and services	4. ISR element satisfies "good" criteria; **AND** 5. Regularly engages with the customer to anticipate their requirements by understanding their operations, listening to their questions and concerns, and identifying intelligence needs to support documented capabilities and concepts; **AND** **6.** Has a formal engagement program established
Comment:			
Note: Analysis fully address customers' requirements within the time constraints and in a manner most useful. Analyst Airmen are responsive to customer feedback. While challenging to evaluate, this tradecraft standard is foundational to AF intelligence analysis.			

Attachment 5

AF ISR SAT TRADECRAFT GUIDE

A5.1. The following 19 figures are excerpts from an AF tradecraft guide on SATs, developed by AFCO-CFA. The figures offer insight into some, but not all, of the key SATs used in intelligence analysis to help improve tradecraft standardization across the AFIAE.

Figure A5.1. Imagination Techniques and Indicators.

IMAGINATION TECHNIQUES AND INDICATORS

Core Techniques	Description	When to Use
Structured Brainstorming	A group process for generating new ideas and concepts	Used to stimulate new thinking and generate a range of hypotheses about an issue
Red Team	A function executed by trained, educated, and practiced team members that provide an independent capability to fully explore alternatives from the perspectives of partners, adversaries, and others	Used to fully explore alternatives in plans, operations, concepts, organizations and capabilities in the context of the operational environment
Alternative Futures Analysis	Tool to help analysts explore multiple ways a situation can develop when there is high complexity and uncertainty	Mostly used when a situation is viewed as too complex or the outcomes are too uncertain to trust a single outcome assessment
Outside-In Thinking	Analytical tool used to identify the full range of basic forces, factors and trends that would indirectly shape an issue	Used to identify all the critical, external factors that could influence how a situation will develop

Figure A5.2. Structured Brainstorming.

STRUCTURED BRAINSTORMING

A technique for stimulating new thinking. It can be applied to virtually all of the other structured analytic techniques and allows the analyst to see a wider range of factors that might bear on the topic.

Brainstorming Ground Rules

1. Never criticize an analyst's ideas
2. Allow sufficient time to brainstorm
3. Involve at least one "outsider" in the process

Divergent Thinking Phase

1. "Post-It" note exercise

Convergent Thinking Phase

1. Arrange notes by commonalities to form clusters
2. Some notes may be moved or copied as cluster form
3. Select a word or phrase that characterizes each cluster
4. Identify any notes that do not fit with others and consider them useless noise or the beginning of an idea that deserves further attention (wild cards)
5. Select one or two areas that deserve the most attention
6. Set priorities based on consensus and decide on the next steps for analysis

Figure A5.3. Red Team Analysis.

RED TEAM ANALYSIS

Function executed by trained, educated, and practiced team members to provide commanders an independent capability to fully explore alternatives in plans, operations, concepts, organizations, and capabilities in the context of the operational environment and from the perspectives of partners, adversaries, and others.

Red Team Techniques

1. Team puts themselves into the adversary's circumstance and reacts as the adversary would
2. Assessments are not coordinated with anyone outside the team
3. Develop set of "first person" questions
4. Draft policy papers in which the group makes decisions, proposes recommendations, or develops courses of action
5. Present analysis in the first-person format
6. Avoid use of caveats or qualifications
7. Focus on a prediction based on the adversary's world
8. Do not plot out all possible courses of action

Figure A5.4. Alternative Futures Analysis.

ALTERNATIVE FUTURES ANALYSIS

An imaginative technique that systematically explores multiple scenarios. This technique can be used when a situation's uncertainty and complexity require consideration of more than one outcome.

Six-Step Process

1. Develop a focused issue and intelligence question
2. Identify drivers, forces, factors, and variables that can affect the issue
3. Select the two most critical and uncertain drivers
4. Establish plausible endpoints for each driver
5. Form a futures matrix by crossing the two axes. The resulting quadrants are the basis for alternative future scenarios
6. Build narratives that describe these futures and how they might come to be (Signposts or Indicators can then be developed)

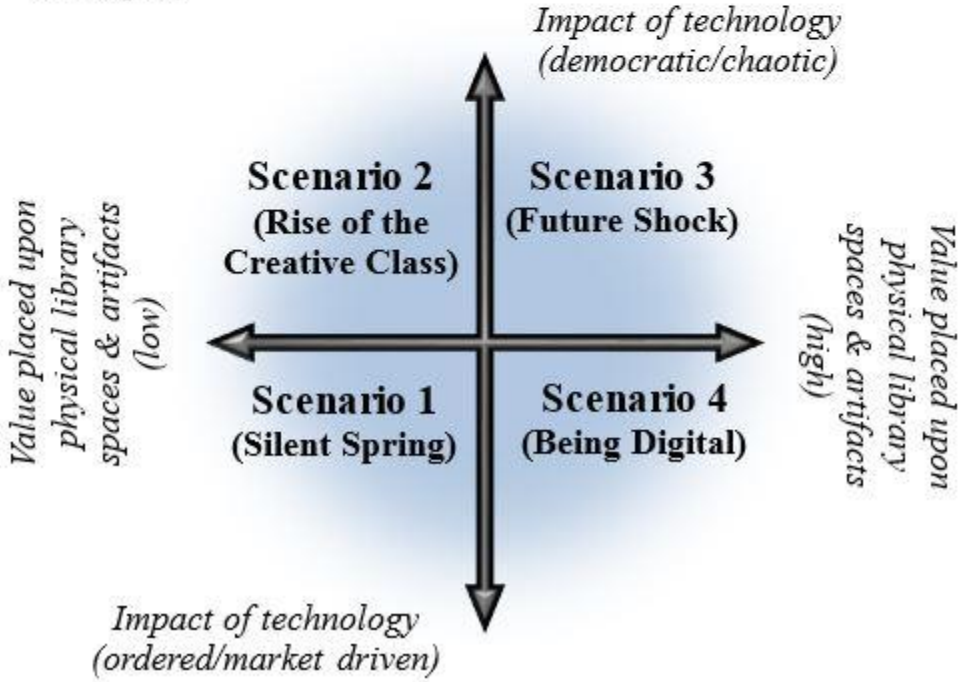

Figure A5.5. Outside-in Thinking.

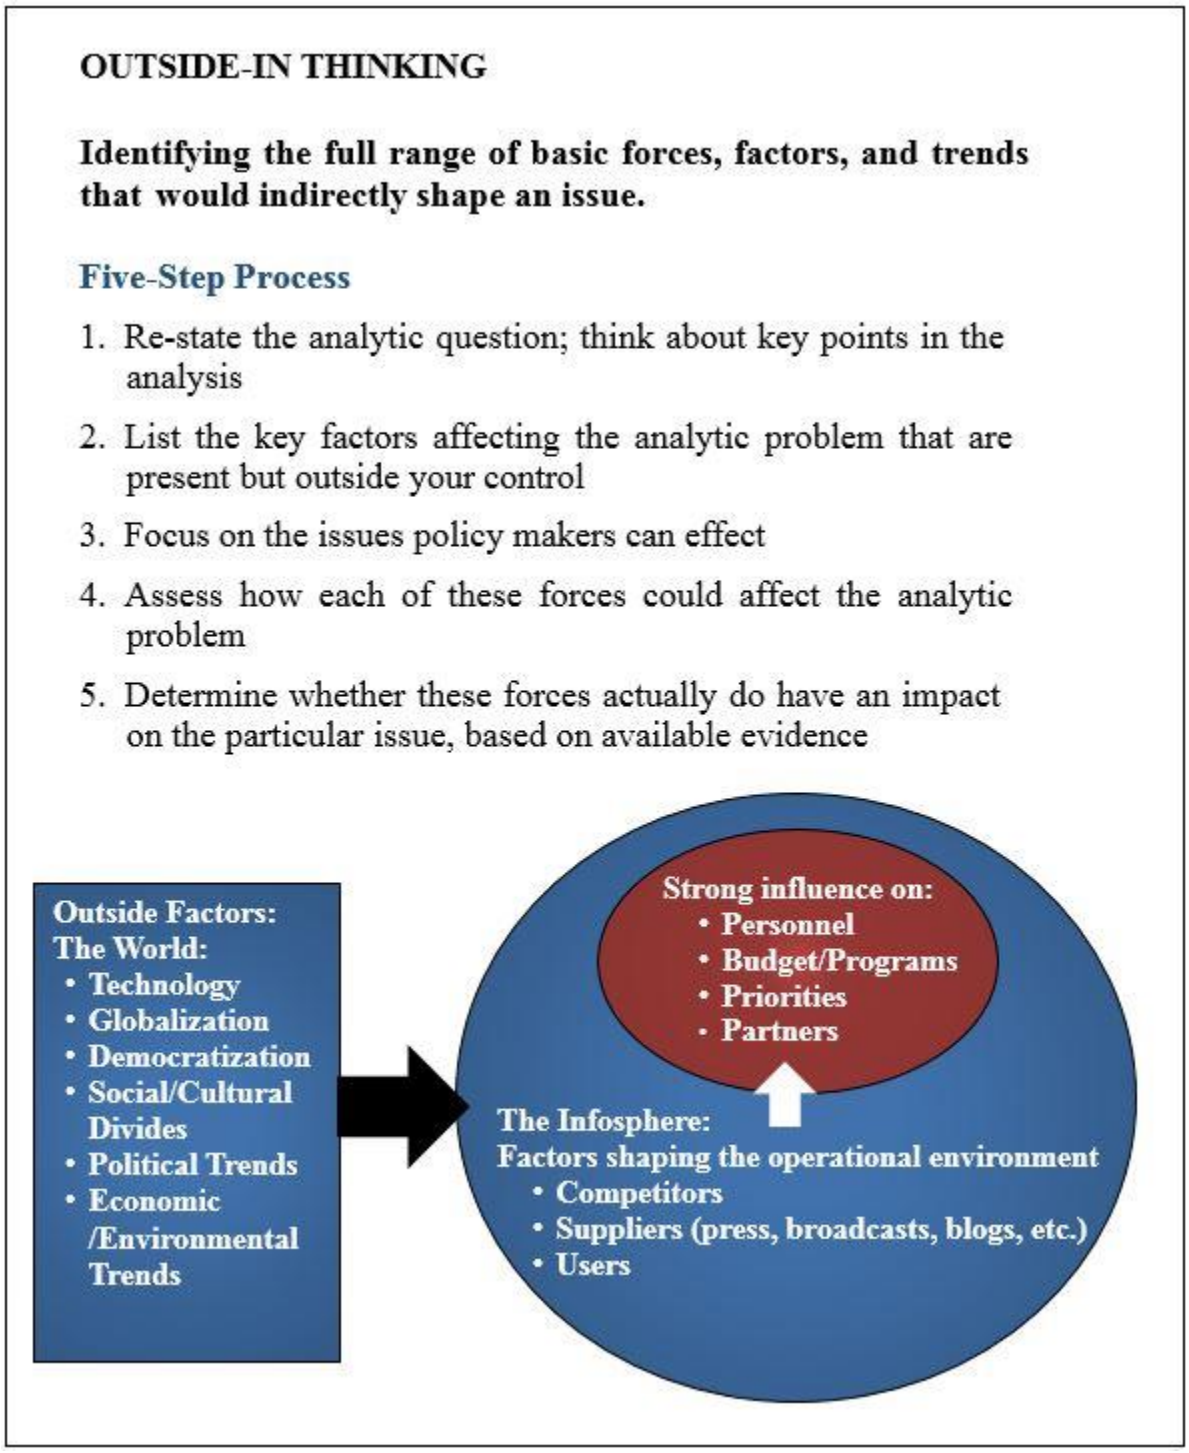

Figure A5.6. Diagnostic Techniques.

DIAGNOSTIC TECHNIQUES

Core Techniques	Description	When to Use
Key Assumptions Check	List and review the key working assumptions on which fundamental judgments rest	Most useful at the beginning of an analytic project
Quality of Information Check	Evaluate completeness and soundness of available information sources	Use to establish confidence level in analytic judgments, & ensure judgments are anchored to strong, relevant sources
Indicators or Signposts of Change	Reviewing observable events and trends to determine if a postulated situation is developing	Used to instill analytic rigor into the analytic process enhancing the credibility of analytic judgments
Deception Detection	Systematic use of checklists to determine when deception may be present and how to avoid being deceived	Used to counter adversary attempts of misinformation, concealment, and misdirection
Analysis of Competing Hypotheses	A systematic and logical approach to generate and evaluate all plausible hypotheses to solve a given problem	Any analysis where there are alternative explanations for what has happened, is happening, or is likely to happen

Figure A5.7. Key Assumptions Check.

KEY ASSUMPTIONS CHECK

A diagnostic technique that identifies hypotheses analysts have accepted to be true and that form the basis of the assumption

Four-Step Process

1. Review the analytic line on the issue; write it down for all to see and defend it orally
2. Articulate all the premises, both stated and unstated in finished intelligence, that are accepted as true for this analytic line to be valid
3. Challenge each assumption, asking why it must be true and whether it remains valid under all conditions
4. Refine the list of key assumptions to contain only those that must be true to sustain your analytic line; consider under what conditions, or in the face of what information, these assumptions might not hold

Questions to Ask

How much confidence exists that this assumption is correct?

What explains the degree of confidence in the assumption?

What circumstances or information might undermine this assumption?

Is a key assumption more likely a key uncertainty or key factor?

Could the assumption have been true in the past but be less so now?

If the assumption proves wrong, would it significantly alter the analytic line? If so, how?

Has this process identified new factors that need further analysis?

Figure A5.8. Quality of Information Check.

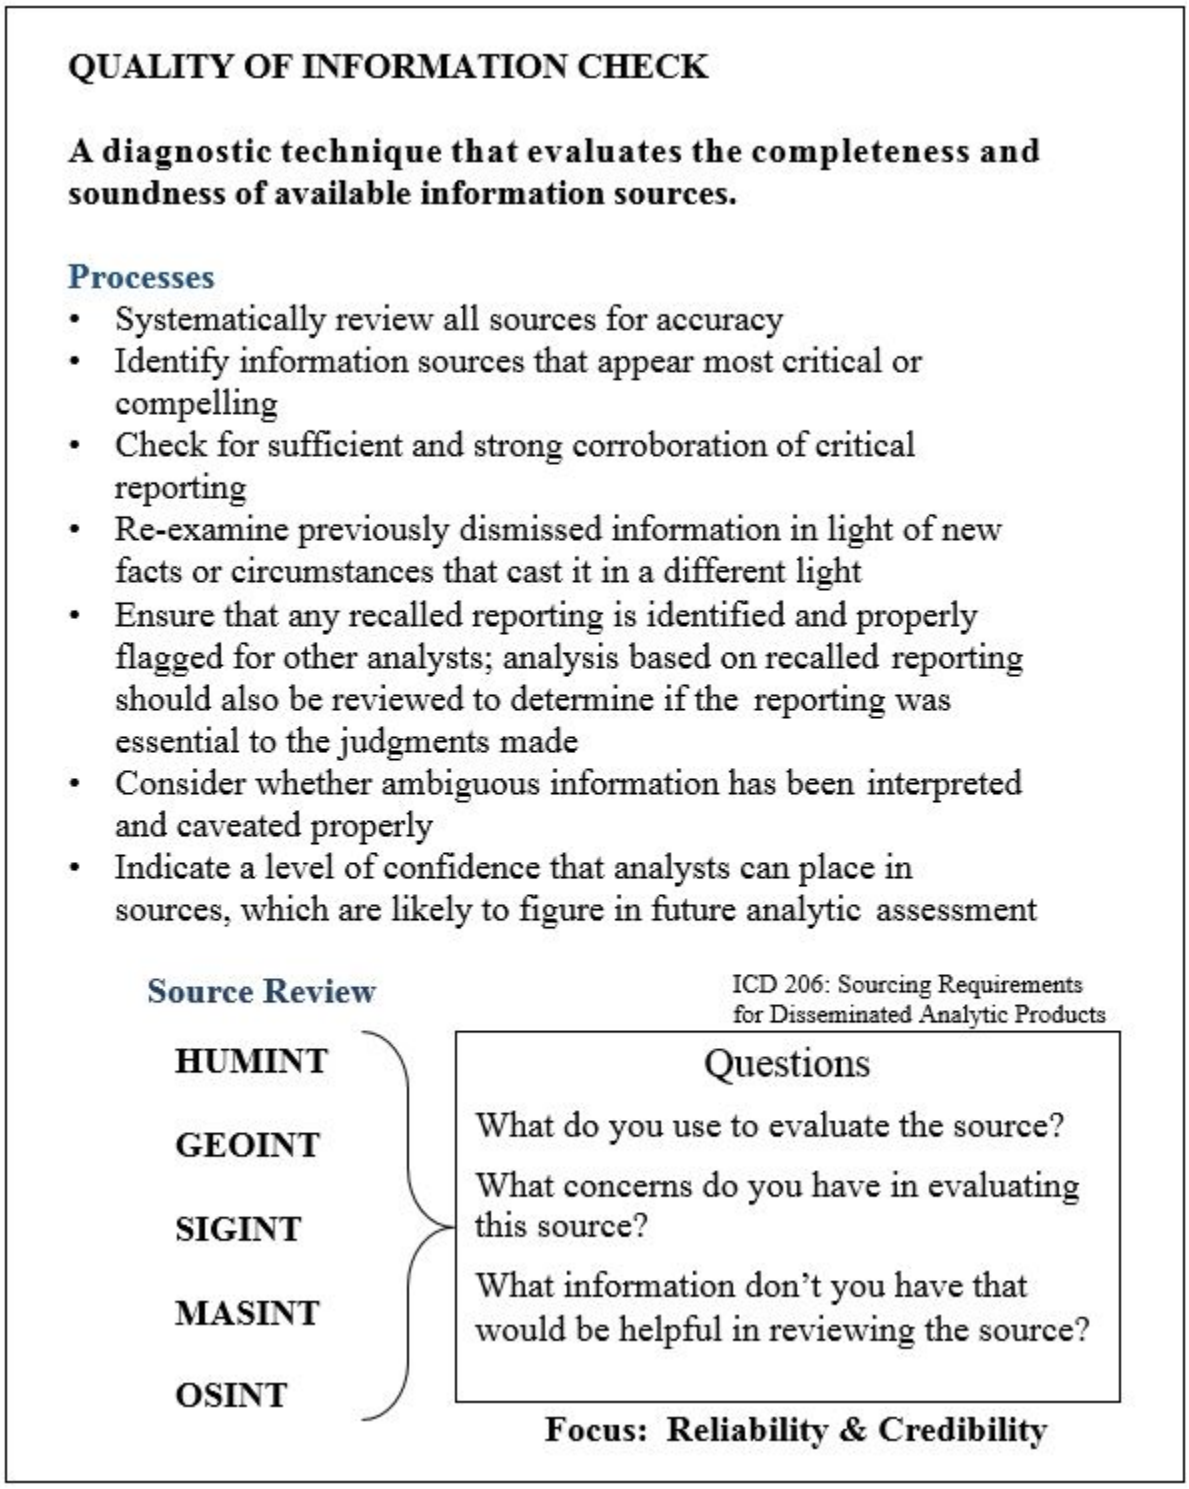

Figure A5.9. Indicators or Signposts of Change.

INDICATORS OR SIGNPOSTS OF CHANGE

Also called Signpost Analysis, this technique involves periodically reviewing a list of observable events or trends to track events, monitor targets, spot emerging trends, and warn of unanticipated change.

Indicator Technique Recommendations	
Analytic Environment	Indicator Technique
Non-Controversial • The issue is non-controversial within the IC or the policy community • Analysts and/or policymakers are uncertain about how the situation will actually evolve	• Simple lists of observables • Two contrasting lists of indicators (that would suggest a leader is growing stronger and a second list that he is growing weaker)
Somewhat Controversial • Some analysts or agencies have preferred positions or established equities to protect • The outcome has major policy or resource implications	• Use simple scales • Provide definitions for each indicator • Portray the information graphically • Revisit on periodic basis
Highly Controversial • Analysts hold strong, contrary views • Major institutional equities are at stake within the IC • The issue is highly charged within the policy community	• Provide a level of confidence for each rating • Provide a narrative description of what one would expect to observe at each level on a rating scale • List the sources of info and how important each was in establishing the rating

Figure A5.10. Deception Detection.

DECEPTION DETECTION

Diagnostic technique where analysts systematically use checklists to determine when deception actually may be present and how to avoid being deceived.

Does a foreign actor have the Motive, Opportunity and Means (MOM) to deceive?

1. Motive (What are the deceiver's goals?)
2. Channels (What means are available?)
3. Risks (What are the risks of discovery?)
4. Costs (Can deception be accomplished?)
5. Feedback (Can the deceiver monitor its use?)

Would this potential deception be consistent with Past Opposition Practices (POP)?

1. Does the deceiver have a history of deception?
2. Does this deception fit past patterns?

Is there cause for concern regarding the Manipulability of Sources (MOSES)?

1. Is the source reliable?
2. Does the source have access?
3. How good are the source's *bona fides*?
4. Is the source vulnerable to control or manipulation by the target?

What can be learned from the Evaluation of Evidence (EVE)?

1. How accurate is the source's reporting?
2. Is the whole chain of evidence available?
3. Does critical evidence check out?
4. Does evidence from one source conflict with others?
5. Do other sources of information provide corroborating evidence?
6. Is the absence of evidence unusual?

Figure A5.11. Analysis of Competing Hypotheses.

ANALYSIS OF COMPETING HYPOTHESES

Provides a systematic and logical approach to generate and evaluate plausible hypotheses to solve a given problem.

Eight-Step Process

1. Generate hypotheses
2. Gather and list evidence
3. Prepare the evidence and hypothesis matrix
4. Refine the matrix
5. Draw tentative conclusions
6. Perform sensitivity analysis
7. Report conclusions
8. Identify milestones

	Cred	Rel	H 1	H 2	H 3
Score			2	4	3
Evidence 1	H	H	C	C	C
Evidence 2	M	M	I	C	C
Evidence 3	M	M	C	C	I
Evidence 4	H	H	I	C	I
Evidence 5	M	M	I	I	C

H – High
M – Medium
L – Low

C – Consistent / Supports
I – Inconsistent / Does Not Support
N/A – Not Applicable

Figure A5.12. Focus Techniques.

FOCUS TECHNIQUES

Core Techniques	Description	When to Use
Issue Development	Used to ensure the central issues and alternative explanations of an issue or problem are identified within the scope and focus of the problem statement to aid in gathering the best answer	Used anytime analysts begin to assess a new issue or problem or begin a new research endeavor to mitigate bias toward the issue
Question Refinement	A simple technique to ensure analysts are answering the right question when responding to an intelligence requirement	Used when a consumer's intelligence requirement is not completely clear or when research begins to lead to ambiguity and confusion

Figure A5.13. Issue Development.

ISSUE DEVELOPMENT

A divergent technique that opens the mind of the analyst to substantive alternatives. Restating a problem opens it up and reveals important perspectives and issues otherwise overlooked.

Start with the initial poorly defined/stated issue

1. Paraphrase: Redefine the issue without losing the original meaning
2. 180 Degrees: Turn the issue on its head. Is the issue the one asked or the opposite of it?
3. Broaden the Focus: Instead of focusing on only one piece of the puzzle, step back and look at several pieces together
4. Narrow the Focus: Can the issue be broken down further? Take the question and ask about the components that make up the problem
5. Redirect the Focus: What outside forces impinge on this issue? Is deception involved?
6. Ask Why: Question the initial issue or question. Develop a new question based on the answer. Then question the second question and develop a new question based on that answer. Repeat this process until you believe the real problem emerges. This process is particularly effective in generating possible alternatives

End with a final refined issue

Figure A5.14. Question Refinement.

QUESTION REFINEMENT

A simple analytical technique used to ensure analysts are answering the right question when responding to a customer's intelligence requirement.

7-Step Process

1. **New Development -** Describe a change to the operating environment or security interests that result in a requirement for intelligence analysis and production.
2. **Raw Question(s) -** In response to the New Development, the immediate questions that come to mind, or that would come to mind for your customer. In relation to an event of interest, the raw questions could be, "Who did it and why?" or "What caused it?"
3. **Key Issue -** A key issue area normally includes an issue area and a geographic area. Issue areas are substantive categories of policy, strategy, or war fighting function. Key issue areas for a military operation can often be found in campaign descriptions of the lines of effort.
4. **National Interests -** The big picture must be considered thoughtfully when refining the intelligence requirement. Analysts should be able to tie assessments to U.S. security interests in general.
5. **Specific Customer Concerns -** This section of the refinery is often used to determine what questions are relevant and required to fulfill the intelligence question versus those specific requirements that might be better answered separately.
6. **Time Frame -** Answering your intelligence requirement should be targeted at a particular time, normally in the future (ex: "in the next 6 months," or "before 1 May 201X").
7. **Refined Question -** The refined intelligence question should be open-ended, requiring more than a yes or no answer, and should meet a specific customer's intelligence needs.

Figure A5.15. Contrarian Techniques.

CONTRARIAN TECHNIQUES

Core Techniques	Description	When to Use
Devil's Advocacy	Technique used to challenge a single, strongly held view or consensus by building the best possible case for an alternative explanation	Used when analysts need to provide further confidence that the current analytic line will hold up to close scrutiny
High Impact / Low Probability	Highlights a seemingly unlikely event that would have major policy consequences if it were to happen	Used when analysts believe an event is unlikely but have not given much thought to the consequences of its occurrence
What If? Analysis	A technique which assumes an event has occurred with potential (negative or positive) impact and explains how it might come about	Used to challenge a strong mindset that an event will not happen or be confidently justified
Team A / Team B Analysis	Separates teams to contrast two or more strongly held views or competing hypotheses	Used when there are two or more equally strong mind-sets held on an issue that need to be clarified (Devil's Advocacy challenges a single dominant mindset)

Contrarian: opposition or rejection of popular opinion

Figure A5.16. Devil's Advocacy.

DEVIL'S ADVOCACY

A contrarian technique for challenging a single, strongly held view or consensus by building the best-possible case for an alternative explanation.

Explicitly challenges key assumptions to see if they will not hold up under some circumstances.

Methodology

1. Outline the mainline judgment and key assumptions and characterize the evidence supporting the current analytic view
2. Select one or more assumptions—stated or not—that appear the most susceptible to challenge
3. Review the information used to determine whether any is of questionable validity, whether deception is possibly indicated, or whether major gaps exist
4. Highlight the evidence that could support an alternative hypothesis or contradicts the current thinking
5. Present to the group the findings that demonstrate there are flawed assumptions, poor quality evidence, or possible deception at work
6. Consider drafting a separate contrarian paper that lays out the arguments from a different analytic conclusion if the review uncovers major analytic flaws
7. Be sure that any products generated clearly lay out the conventional wisdom and are identified as an explicitly "Devil's Advocate" project; otherwise the reader can become confused as to the current official view on the issue

Figure A5.17. High Impact / Low Probability.

HIGH IMPACT / LOW PROBABILITY

A technique used to highlight a seemingly unlikely event that would have major policy consequences if it happened.

If there is a strongly-held view that an event is unlikely, then postulating precisely the opposite should not be difficult.

Perform the following steps to determine the effects of High Impact/Low Probability events:

1. Define the high-impact outcome clearly. This process is what will justify examining what most analysts believe to be a very unlikely development
2. Devise one or more plausible explanations for or "pathways" to the low probability outcome. This should be as precise as possible, as it can help identify possible indicators for later monitoring
3. Insert possible triggers or changes in momentum if appropriate. These can be natural disasters, sudden health problems of key leaders, or new economic or political shocks that might have occurred historically or in other parts of the world
4. Brainstorm with analysts having a broad set of experiences to aid the development of plausible but unpredictable triggers of sudden change
5. Identify for each pathway a set of indicators or "observables" that would help you anticipate that events were beginning to play out this way
6. Identify factors that would deflect a bad outcome or encourage a positive outcome

Figure A5.18. "What If" Analysis.

"WHAT IF" ANALYSIS

That "What If?" Analysis is the technique which assumes an event has occurred with potential (negative or positive) impact and explains how it might come about.

Method

1. Assume the event has happened
2. Select some triggering events that permitted the scenario to unfold to help make the "what if" more plausible; for example, analysts might postulate the death of a leader, a natural disaster, or some economic event that would start a chain of other events
3. Develop a chain of argumentation based as much on logic as evidence to explain how this outcome could have come about
4. "Think backwards" from the event in concrete ways–that is, specifying what must actually occur at each stage of the scenario is often very useful
5. Identify one or more plausible pathways or scenarios to the unlikely event; very often more than one will appear possible
6. Generate a list of indicators or "observables" for each scenario that would help to detect the beginnings of the event
7. Consider the scope of the positive and negative consequences of each scenario and their relative impacts
8. Monitor the indicators developed on a periodic basis

Figure A5.19. Team A / Team B.

TEAM A / TEAM B

Used when there may be competing and possibly equally strong mind sets held on an analytical issue; this approach helps opposing groups see the merit in each other's perspective.

Two Phases

1)Analysis Phase

1. Identify the two or more competing hypotheses or points of view
2. Form teams or designate individuals to develop the best case for each hypothesis
3. Review all pertinent information that supports their respective position
4. Identify missing information that would strengthen their hypotheses
5. Structure each argument, presenting key assumptions, key pieces of evidence, and careful articulation of the logic behind the argument

2)Debate Phase

1. Set aside time for an oral presentation of the alternative team findings; this can be an informal brainstorming session or a more formal debate
2. Have an independent jury of peers to listen to the oral presentation and be prepared to question the teams regarding their assumptions, evidence, or logic
3. Allow each team to present its case, challenge the other team's arguments, and rebut the opponent's critique of its case
4. Let the jury consider the strength of each presentation and recommend possible next steps for further research and collection efforts

Attachment 6

IC, DOD, AND MILITARY SERVICE REFERENCES

A6.1. The IC. As shown in Table A6.1, *Members of the IC*, the IC is a coalition of 17 agencies and organizations, including the ODNI, within the Executive Branch that work both independently and collaboratively to gather and analyze the intelligence necessary to conduct foreign relations and national security activities.

Table A6.1. Members of the IC.

Office of the Director of National Intelligence (ODNI)	
U.S. Air Force (USAF) Intelligence	Department of the Treasury
U.S. Army (USA) Intelligence	Drug Enforcement Agency (DEA)
Central Intelligence Agency (CIA)	Federal Bureau of Investigation (FBI)
U.S. Coast Guard (USCG) Intelligence	U.S. Marine Corps (USMC) Intelligence
Defense Intelligence Agency (DIA)	National Geospatial-Intelligence Agency (NGA)
Department of Energy (DOE)	National Reconnaissance Office (NRO)
Department of Homeland Security (DHS)	National Security Agency (NSA)
Department of State (DOS)	U.S. Navy (USN) Intelligence

A6.2. IC and DoD Reference Documents. Table A6.2, *Common IC and DoD Analysis References*, lists various IC and DoD publications that most often impact AF analysis.

Table A6.2. Common IC and DoD Analysis References.

IC
DNI *Principles of Intelligence Transparency for the Intelligence Community* ICD 191, *Duty to Warn* ICD 203, *Analytic Standards* ICD 204, *National Intelligence Priorities Framework* ICD 205, *Analytic Outreach* ICD 206, *Sourcing Requirements for Disseminated Analytic Products* ICD 208, *Maximizing the Utility of Analytic Products* ICD 209, *Tearline Production and Dissemination*
DoD
DoDI 3115.17, *Management and Oversight of DoD All-Source Analysis* DIA Directive (DIAD) 5000.200, *Intelligence Threat Support for Major Defense Acquisition*

Programs

DIA Instruction (DIAI) 5000.002, *Intelligence Threat Support for Major Defense Acquisition Programs*

DIAP Users Guide

DoD Directive (DoDD) 5000.01, *The Defense Acquisition System*

DoDD 5105.21, *Defense Intelligence Agency*

DoDD 5250.01, *Management of Intelligence Mission Data (IMD) in DoD Acquisition*

DoDI 5000.02, *Operation of the Defense Acquisition System*

A6.3. Military Services. As depicted in Table A6.3, *Major Intelligence Analysis Entities of the Military Services*, each military service has a SIO that oversees intelligence policy, planning, programming, and activities on behalf of the service chief. The AF SIO is the DCS for ISR, also known as the AF/A2. Each service is authorized one service intelligence center, also called an intelligence analysis center. The AF's service intelligence center is NASIC. The AF has assigned the ACC as its lead MAJCOM for the GIISR capability, which includes intelligence analysis. Similarly, other military services have assigned significant analysis responsibilities to various organizations. All services routinely reach out to each other for service-unique expertise and collaboration in addressing analysis requirements.

Table A6.3. Major Intelligence Analysis Entities of the Military Services.

	USAF	USA	USN	USMC	USCG
Service Senior Intelligence Officer (SIO)	Deputy Chief of Staff for ISR (USAF/A2)	Deputy Chief of Staff for Intelligence (USA/G2)	Director of Naval Intelligence (USN/N2/6)	Director of Intelligence (USMC/DIRINT)	Assistant Commandant for Intelligence (USCG/CG-2)
Service Intelligence Center	National Air and Space Intelligence Center (NASIC)	National Ground Intelligence Center (NGIC)	Office of Naval Intelligence (ONI)	Marine Corps Intelligence Activity (MCIA)	Intelligence Coordination Center (ICC)
Lead Command	Air Combat Command (ACC) 1. Core Function Lead Integrator (CFLI) for Global Integrated ISR (GIISR) **2.** Chair, Analysis Capability Working Group (ACWG)	Intelligence and Security Command (INSCOM)	N/A	N/A	N/A
Other Major Analysis Organizations	1.Intelligence Systems Support Office (ISSO) 2.363 ISRW 1.Civil Aviation Intelligence Analysis Center (CAIAC)		• Nimitz Operational Intelligence Center • Farragut Technical Analysis Center • Kennedy Irregular Warfare Center Hopper		• Maritime Intelligence Fusion Center Atlantic (MICF LANT) • Maritime Intelligence Fusion Center Pacific (MICF PAC) Coast Guard Investigative Service (CGIS)

			Information Services Center		
Counter-Intelligence Organizations	AF Office of Special Investigations (AFOSI)	Army Counterintelligence Center (ACIC)	Naval Criminal Investigative Service (NCIS)	2nd Intelligence Battalion	Coast Guard Counterintelligence Service (CGCIS)

Notes:
1. The USA service intelligence center (NGIC) falls under INSCOM. The service intelligence center in each of the other military services falls under the service SIO.
2. The AF assigns a CFLI to each of its major capabilities. The ACC Commander is the GIISR CFLI, which includes intelligence analysis. The ACC staff coordinates closely with intelligence analysis stakeholders across the AFIAE to develop, program, and advocate for intelligence analysis capabilities and requirements.
3. The ACWG serves as a cross-MAJCOM entity of analysis stakeholders responsible for supporting the development and advancement of air, space, and cyberspace intelligence analytical capabilities within the AF ISR Enterprise and across the full range of military operations. The ACWG provides a means to coordinate, assess, and synchronize AF intelligence analysis policies, tradecraft, education, training, and tools, as well as to recommend materiel and non-materiel solutions through established AF processes and offices.

A6.4. Common Analysis Organizations. Table A6.4, *Intelligence Analysis Organizations by Mission Type*, identifies IC, DoD, military service, and other government agencies organized according to the primary analysis they conduct. The table is not meant to be exhaustive; rather it provides a sampling of missions and the key analysis organizations that support them.

Table A6.4. Intelligence Analysis Organizations by Mission Type.

Air / Integrated Air Defense Systems	**Short Range Missiles**	**Med / Long Range Missiles**	**Ground**
NASIC	MSIC	NASIC	NGIC
Maritime	**Space**	**Cyber**	**Counter-IED**
ONI MCIA	NASIC NRO 14 AF	CYBERCOM NSA NASIC 24 AF 25 AF AFOSI	JIDA
Counter-terrorism	**Counter-intelligence**	**Threat Finance**	**Criminal**
NCTC DHS FBI CIA CGIS	AFOSI CIA FBI ACIC NCIS 2d Intelligence Btn CGCIS	Treasury FBI	AFOSI FBI NCIS CID CGIS
Rotary Wing	**Unmanned Systems**	**Surface-to-Air Missiles**	**Electronic Warfare Systems**
NGIC	NASIC NGIC ONI	MSIC	NASIC NGIC ONI
Rapid Air Mobility	**Global Commons**		
AMC AIS	CAIAC		

	NAI2O TRANSCOM JIOC AMC AIS MIFC LANT MIFC PAC		

Notes:
1. As the DoD functional manager for analysis, DIA provides overarching all-source analysis and/or guidance for all mission types listed.
2. The Missile and Space Intelligence Center (MSIC) is an equivalent organization to the service intelligence centers. Additionally, MSIC provides support to space analysis.
3. CYBERCOM—Cyber Command; JIDA—Joint Improvised-Threat Defeat Agency; NCTC—National Counterterrorism Center; CGIS—Coast Guard Investigation Service; Btn—Battalion; CID—Criminal Investigation Command; NAI2O—National Aviation Intelligence Integration Office; TRANSCOM—Transportation Command

Attachment 7

ONLINE RESOURCES FOR ANALYSIS SKILLS AND TRADECRAFT.

Table A7.1, *Online Resources for Skills and Tradecraft,* identifies resources that contain additional background, information, and guidance on analysis skills and tradecraft topics discussed in Chapter 5. The list reflects some of the common resources as of 2017 and is not meant to be exhaustive nor all-inclusive.

Table A7.1. Online Resources for Skills and Tradecraft.

Attachment 8

ANNOTATED BIBLIOGRAPHY

This attachment contains IC and academic resources for analyst Airmen to reference to improve their analysis aptitude. The list reflects some of the common references as of 2017 and is not meant to be exhaustive nor all-inclusive.

A8.1. Analysis Skills, Tradecraft, and Processes in the IC. The following texts focus specifically on IC analysis.

711th Human Performance Wing (HPW), ***The Framework for Analytic Cognition (FAC)***, AFRL, Wright-Patterson Air Force Base, Ohio, April 2014
This report serves as a guide to conducting intelligence analysis thoroughly while remaining sufficiently pliable to adapt to unstructured issues. It focuses on describing methods to foster analyst understanding of human-shaped capabilities and intentions for application in intelligence missions.

CIA, ***A Tradecraft Primer: Structured Analytic Techniques for Improving Intelligence Analysis,*** March 2009, https://www.cia.gov/library/center-for-the-study-of-intelligence/csi-publications/books-and-monographs/Tradecraft%20Primer-apr09.pdf
This guide highlights several structured analytic techniques to outline and assist analysts to think about and work difficult problems associated with intelligence analysis. The primer identifies several hurdles to this process such as biases, expectations, and mental models. Ultimately, the guide aims to inform intelligence analysts about their thinking processes to increase their self-awareness and efficacy in making judgments.

Clark, Robert M., ***Intelligence Analysis: A Target-Centric Approach***, 4th edition, CQ Press, 2012
This book urges analysts to focus on the intelligence problem at hand to drive insight. It provides a thorough overview of how the intelligence analysis process works with ample examples. The book also identifies areas where intelligence analysis could/should work better.

Clark, Robert M., ***The Technical Collection of Intelligence***, CQ Press, 2010
This book examines the technical means by which advanced countries collect intelligence information (acoustic, infrared, etc.). The author describes the collection, processing, and exploitation phases of intelligence technical collection in an understandable language.

Defense Intelligence Reference Document DIA-01-1003-001A, ***Tradecraft Primer: Basic Structured Analytic Techniques***, 4th edition, 3 March 2011
This DIA handbook provides an outline of analytic methods to help intelligence analysts improve their critical thinking skills, producing more thorough, less biased judgments. The techniques provided in this text also function to build a common lexicon in the IC, fostering consistent understanding and thereby efficiency and accuracy.

Folker, Robert D. Jr., ***Intelligence Analysis in Theater Joint Intelligence Centers: An Experiment in Applying Structured Methods***, Occasional Paper #7, Joint Military Intelligence College, 2000
This summary of a master's thesis compares the results of those who used a specific structured analytic technique with those who did not in preparing intelligence estimates.

Fingar, Thomas, ***Reducing Uncertainty: Intelligence Analysis and National Security***, Stanford Security Studies, 2011

The goal of this book is to inform readers from outside the IC what analysts in the IC do and how they do it. The book explains the pressures IC analysts are under (political etc.), why they often focus on worst-case scenarios, and the value of National Intelligence Estimates.

Fischhoff, Baruch, and Cherie Chauvin, ***Intelligence Analysis: Behavioral and Social Scientific Foundations***, National Academies Press, 2011

This book focuses on the human aspect of the IC and how to improve judgments made by both individual analysts and groups of analysts. The book provides an overarching perspective on the issues and processes that contribute to tough decision and judgment making.

George, Roger Z., and James B. Bruce, ed., ***Analyzing Intelligence: Origins, Obstacles and Innovation***, Washington D.C.: Georgetown University Press, 2008

This book provides a post-9/11 assessment of the state of intelligence analysis. The text offers insights into the obstacles for intelligence analysis, providing a plan to improve analytical methods, training, and approach. The book highlights adapted tradecraft, predictive analysis, and collaboration as areas needing improvement.

Grabo, Cynthia, ***Anticipating Surprise: Analysis for Strategic Warning***, University Press of America, 2002

This book, originally designed as a CIA analyst training guide, outlines the steps in the anticipatory analysis process, including discussing guidance for assessing the meaning of pieces of intelligence. In the wake of post-9/11 IC critiques, the author provides suggestions on how to improve and clarify warnings to decision makers.

Hackman, Richard J., ***Collaborative Intelligence: Using Teams to Solve Hard Problems***, San Francisco: Berrett-Koehler Publishers Inc., 2011

The book highlights the increased need and prevalence for interdisciplinary collaboration in intelligence analysis and identifies that most teams in the field often break down or prove ineffective. The author outlines six conditions leaders can employ to encourage the development, efficacy, and maintenance of teams working on intelligence analysis tasks.

Hall, Wayne Michael, and Gary Citrenbaum, ***Intelligence Analysis: How to Think in Complex Environments***, Santa Barbara, California: Praeger Security International, 2010

This book discusses the various types of advanced analysis—including anticipatory, semiotics, and link analysis—while laying out the steps of analytical problem solving: decomposition, critical thinking, analysis, recomposition, and synthesis. The book also discusses the systems of thought and how those impact an individual's analytical process and decision/judgment.

Heuer, Richards J., Jr., ***The Psychology of Intelligence Analysis***, Washington, D.C.: Central Intelligence Agency, Center for the Study of Intelligence, 1999

This collection of CIA articles spanning 1978-1986 reviews timeless concepts of cognitive psychology concerning how individuals gather and process information to shape their judgments.

Heuer, Richards J., Jr. and Randolf H. Pherson, ***Structured Analytic Techniques For Intelligence Analysis***, Washington, D.C.: CQ Press, 2014

This text identifies best practices in structured analysis to inform analysts within the intelligence field and across other disciplines.

Kent, Sherman, ***Strategic Intelligence for American World Policy***, Princeton University Press, 2015

This book was originally written and published in 1966 by Sherman Kent, who pioneered many of the methods of intelligence analysis. The book analyzes the varied aspects of what is known as "high-level foreign positive intelligence." Kent asserts that very little of it involves cloaks and

daggers. All of it is important to national survival, and should be understood by the citizens of a democracy.

Kerbel, Josh, and Anthony Olcott, *Synthesizing with Clients, Not Analyzing for Customers*, Studies in Intelligence, Vol. 54, No. 4. December 2010, https://www.cia.gov/library/center-for-the-study-of-intelligence/csi-publications/csi-studies/studies/vol.-54-no.-4/synthesizing-with-clients-not-analyzing-for.html

This article discusses the challenges, purpose, and shortcomings of the separation between analysts and the policy/decision makers they inform. One purpose is to avoid politicization of analysis and mitigate confirmation biases, but the separation can also lead to unanswered questions from decision-makers or ignored reports created by the analysts but not read.

Lowenthal, Mark M., *Intelligence: From Secrets to Policy*, 6th edition, CQ Press, 2014

This text provides an introduction to the field of intelligence, from both the analyst and policymaker perspectives. This book covers all phases and domains of intelligence analysis, providing current event examples and trends to watch.

Moore, David T., *Critical Thinking and Intelligence Analysis*, 2nd edition, Books Express Publishing, 2010

This book, sponsored by the National Defense Intelligence College, establishes how critical thinking fits into intelligence analysis. The author offers input on how to teach critical thinking to analysts with the goal of integrating into the intelligence analysis process.

Moore, David T., *Sensemaking: A Structure for an Intelligence Revolution*, 2nd edition, CreateSpace Independent Publishing Platform, 2013

The goal of this book is to identify where and how to improve the IC and its processes. The text identifies problem areas, including discussions of 'wicked problems,' complexity theory, and macro-vs-micro cognition. It also proposes possible solutions.

Symon, Paul B., and Arzan Tarapore, "Defense Intelligence Analysis in the Age of Big Data," *Joint Forces Quarterly*, Vol 79, 4th Quarter 2015

This article discusses the emerging challenge of big data analytics for military intelligence communities. The article highlights that, although big data generates knowledge creation, additional tools and methods are needed to absorb, process, and analyze the vast onslaught of information.

White, Jeffrey, *Shakespeare for Analysts: Literature and Intelligence*, CreateSpace Independent Publishing Platform, 2013

This paper, originally sponsored by the Joint Military Intelligence College in 2003, advocates inclusion of Shakespeare in intelligence analysts' bookshelves. The author asserts that since analysts are concerned with human personalities within political and military leadership, analysts should use Shakespeare's work as insight into how people are motivated and pursue power.

Zegart, Amy B., *Flawed by Design: The Evolution of the CIA, JCS, and NSC*, Stanford University Press, 2000

Using an institutionalist approach, the author asserts that the CIA, Joint Chiefs of Staff (JCS), and National Security Council (NSC) are hindered from operating effectively by design. Frequent elections, the prominence of elected officials controlling these organizations, and Congressional checks foster competitive, rival organizations fighting amongst themselves to protect their own intelligence assets.

A8.2. Analysis Skills, Tradecraft, and Processes in General . Whereas section A8.1 identifies sources that specifically address IC skills, tradecraft, and processes, the following

sources apply to the discipline of analysis writ large. While the following were written with a broader academia focus, they are also relevant to IC analysis.

Bothamley, Jennifer, *Dictionary of Theories*, Barnes & Noble, 2004
This book is a composite reference that alphabetically arranges theories, laws, hypotheses, etc. from across many disciplines. It serves as a thorough annotated bibliography of well-known theories, and includes short descriptions and comments on the validity of each entry.

Cukier, Kenneth Neil, and Viktor Mayer-Schoenberger, "The Rise of Big Data: How It's Changing the Way We Think," *Foreign Affairs*, May - June 2013, https://www.foreignaffairs.com/articles/2013-04-03/rise-big-data
This article discusses the concept of big data, describing the vast and increasing amount of information that can be harnessed, processed and used to support trends and inform new knowledge. The article also cautions that big data should be used to inform but not explain everything.

Dewey, John, *How We Think*, Boston, Massachusetts: D.C. Heath and Co. Publishers, 1910
This book offers an early overview of the importance of self-awareness in thought. The author calls for a focus in "mental training" and "training of thought" to increase one's deliberateness when thinking, solving, and assessing problems.

Elder, Linda, and Richard Paul, *The Thinker's Guide to Analytic Thinking*, 2nd edition, Dillon Beach: Foundation for Critical Thinking Press, 2007
This guide describes the structures and importance of analytic thinking. The authors discuss how we reach our conclusions and judgements–viewing an idea through our biases, point of view, experiences, and assumptions. The book provides a framework for understanding how we think and how that impacts decisions.

Facione, Peter, *Critical Thinking: What It Is and Why It Counts*, Milbrae, California: Measured Reasons and the California Academic Press, 2013
This essay familiarizes readers with the key skills and habits associated with critical thinking and why practicing critical thinking is useful in their personal and social decision-making. The article identifies several of the heuristic strategies individuals are naturally inclined towards and the pros/cons and biases associated therein.

Facione, Peter, and Carol Ann Glittens, *Think Critically*, 3rd edition, Prentice Hall, Pearson Education Inc., 2015
This text introduces and practically describes critical thinking as important for making big decisions in the real-world.

Foundation for Critical Thinking, *The Critical Thinking Community*, http://www.criticalthinking.org
This website is sponsored by the Foundation for Critical Thinking, a non-profit organization that seeks to promote essential change in education and society through the cultivation of fair-minded critical thinking—thinking which embodies intellectual empathy, humility, perseverance integrity, and responsibility.

Gilovich, Thomas, *How We Know What Isn't So: The Fallibility of Human Reason in Everyday Life*, The Free Press, 1991
This book addresses the question: When can we trust what we believe, and when are these beliefs suspect? Thomas Gilovich offers a wise and readable guide to the fallacy of the obvious in everyday life. Illustrating his points with vivid examples, he documents the cognitive and social processes that distort our thoughts, beliefs, judgements, and decisions, inevitably altering our impression of reality.

Grimes, Geoffrey, ***Scholasticism, Rationalism, and Empiricism: Epistemology and Three Western Systems of Reasoning***, http://www.distancelearningassociates.org/eng2327/BC-ReasoningSystems.htm
This website discusses the basic concepts of what the author describes as three core systems of reasoning: scholasticism, rationalism, and empiricism. The author asserts all those raised in Western cultures can be binned into one of these three categories.
Jones, Morgan D., ***The Thinker's Toolkit: 14 Powerful Techniques for Problem Solving***, Crown Business, 1998
This handbook provides fourteen tools to help individuals break down problems, enabling more efficient and informed decisions.
Kahneman, Daniel, ***Thinking, Fast and Slow***, New York: Farrar, Straus and Giroux, 2011
In this book author Daniel Kahneman describes the two systems of thinking: the intuitive (fast System 1) and the logical (thorough System 2). The text describes the identifiers of each system and how it impacts our decisions. The author provides methods to identify and prevent mental shortcuts that can cause judgement errors.
Kahneman, Daniel, Andrew Rosenfield, Linnea Gandhi, and Tom Blaser, ***Noise: How to Overcome the High, Hidden Cost of Inconsistent Decision Making***, Harvard Business Review, 2016
This article explains the difference between the concepts of "noise" and bias and provides a prescription of how leaders can test the level of "noise" in their organizations. Further, it describes steps to mitigate noise and promote analytical consistency.
Kahneman, Daniel, Paul Slovic, and Amos Tversky, ***Judgement under uncertainty: Heuristics and biases***, Cambridge University Press, 1982
This book describes the various judgment heuristics and biases. The text discusses how those biases can impact decision-making and judgments and suggests methods for identifying and overcoming these biases.
Kaplan, Abraham, ***The Conduct of Inquiry: Methodology for Behavioral Science***, Transaction Publishers, 1998
In this book the author discusses the various behavioral science disciplines and the methodologies and shortcomings of each. It provides a constructive assessment of the various standards and strategies of social research methods to guide behavioral scientists' research.
Kosko, Bart, ***Fuzzy Thinking: The New Science of Fuzzy Logic***, Hyperion, 1993
This book discusses the concept of fuzzy thinking/fuzzy logic, the principle that nothing is absolute. The author challenges the typical Western thinking that there is black and white—right and wrong, asserting that there are lots of shades of gray, with many perspectives.
Krizan, Lisa, ***Intelligence Essentials for Everyone***, Joint Military Intelligence College, June 1999
This paper provides guidance for the implementation of sound intelligence within and outside government infrastructure. The author describes the methods to employ to reach empirically-supported decisions with fewer flaws.
Laney, Douglas, et al., ***How Data Scientist Skills and Qualifications Differ from those of BI Analysts and Statisticians***, 21 October 2015
This article helps readers understand the distinction between the new data scientist career and associated skill-set and the legacy career of statisticians. Additionally, the authors describe why a statistician is not adequate for data science problems.

Lengler, Ralph, and Martin J. Eppler, ***A Periodic Table of Visualization Methods***,
http://www.visual-literacy.org/periodic_table/periodic_table.html
This online learning tool informs users on the ability to generate, understand, and apply visualizations. The site employs a didactic approach using problem-based learning techniques to foster understanding of visualization methods.
Linden, Alexander, et al., ***Organizational Principles for Placing Advanced Analytics and Data Science Teams***, 4 September 2013
With the onslaught of big data driving the need for teams of advanced analysts and data scientists in organizations of various disciplines, this article discusses where to best place these teams organizationally and the pros and cons of various locations.
Livio, Mario, ***The Equation that Couldn't be Solved: How Mathematical Genius Discovered the Language of Symmetry***, Simon & Schuster, 2006
This book attempts to explain mathematical symmetry through a "quantic" equation to non-mathematically inclined readers. The text discusses how the idea of group theory arose.
Mackay, Charles, ***Extraordinary Popular Delusions and the Madness of Crowds***, CreateSpace Independent Publishing Platform, 2013
This book studies the psychology of crowds and mass mania with historical examples such as the witch hunts. The text offers explanation as to why reasonable, intelligent individuals take on opinions in a crowd environment that they otherwise would not.
Margolis, Howard, ***Patterns, Thinking, and Cognition: A Theory of Judgement***, Chicago, Illinois: University of Chicago Press, 1987
This book discusses how pattern recognition impacts thinking and judgment. The author discusses identification of patterns, sub-patterns and when anomalies are actually part of the pattern.
Mlodinow, Leonard, ***The Drunkard's Walk: How Randomness Rules Our Lives***, Vintage, 2009
This book discusses how much of our lives are lived and guided by randomness. He introduces the concept of chaos theory, and reveals psychological illusions guiding "chance." The text presents several tools to help readers make more informed decisions in their everyday lives.
Pirsig, Robert M., ***Zen and the Art of Motorcycle Maintenance***, Bantam, 1975
In this book the author combines philosophy with the practical, real-world processes of motorcycle mechanics. Despite the title, this book prompts the reader to deep-think about critical thinking methods and more complex philosophical dilemmas, such as good-vs-evil.
Surowiecki, James, ***The Wisdom of Crowds***, Anchor Books, 2008
This book asserts that crowd-sourcing perspectives, or incorporating a range of diverse perspectives, improves problem-solving. The author identifies four necessary conditions that, when met, produce crowds that are smarter together than any one individual.
Tetlock, Philip E., and Dan Gardner, ***Superforecasting: The Art and Science of Prediction***, 1st edition, 2015
In this work, Philip Tetlock and coauthor Dan Gardner offer a masterwork on prediction, drawing on decades of research and the results of a massive, government-funded forecasting tournament. Superforecasting offers the first demonstrably effective way to improve our ability to predict the future.
Tufte, Edward R., ***The Visual Display of Quantitative Information***, 2nd edition, Cheshire, Connecticut: Graphics Press, 2001

This text covers the theory and practice used in the design and use of statistical graphics, charts and tables. It outlines the benefits and potential misrepresentation of empirical visualization methods.

A8.3. Studies and White Papers on Analysis. ***Air Force Intelligence Analysis Roles and Responsibilities Review for 2016***, September 2016

This report is a primary deliverable for the AF Analysis Plan of Action and Milestones. The report details the results of an AF-wide review of roles and responsibilities for analysis and production.

Alkire, Brien, Abbie Tingstad, Dale Benedetti, Amado Cordova, Irina Danescu, Lt Col William Fry, Brig Gen (ret.) D. Scott George, Lawrence M. Hanser, Lance Menthe, Erik Nemeth, David Ochmanek, Julia Pollak, Jessie L. Riposo, Lt Timothy Smith, Alexander Stephenson, ***Leveraging the Past to Prepare for the Future of Air Force Intelligence Analysis***, Santa Monica, California: RAND Corporation, RR-1330-AF, 2016, http://www.rand.org/pubs/research_reports/RR1330.html

This RAND report looks to the past for lessons to help inform recommendations in addressing future challenges for the AFIAE. The report identifies challenges regarding future operational pace, contextual and deep knowledge, the integration and understanding of space and cyber missions, and the growing volume of data to be analyzed.

Chang, Welton, Eva Chen, Barbara Mellers, and Philip Tetlock, "Developing Expert Political Judgment: The Impact of Training and Practice on Judgmental Accuracy in Geopolitical Forecasting Tournaments," ***Judgment and Decision Making*** 11, no. 5 (2016): 509-26

This essay tests the power of a cognitive-debiasing training module to improve probability judgments in a four-year series of geopolitical forecasting tournaments sponsored by the U.S. Intelligence Community.

Committee on Improving the Effectiveness and Efficiency of U.S. Air Force Pre-Acquisition Development Planning et al., ***Development Planning: A Strategic Approach to Future Air Force Capabilities***, National Academies Press, 2015

This book provides recommendations, informed by development planning efforts of the past, for leaders to think strategically into upcoming decades concerning where the AF may have capability gaps.

Committee on U.S. Air Force Strategic Deterrence Military Capabilities in the 21st Security Environment et al., ***U.S. Air Force Strategic Deterrence Analytic Capabilities: An Assessment of Tools, Methods, and Approaches for the 21st Century Security Environment***, National Academies Press, 2015

This book describes the analytic skills required in successful nuclear deterrence. The text also discusses how nuclear deterrence works through assurance and posture, how it can fail, and how to mitigate the risk of deterrence failure.

DCS for ISR White Paper, ***Data Science and the USAF ISR Enterprise***, February 2016, http://www.defenseinnovationmarketplace.mil/resources/Data_Science_and_the_USAF_ISR_Enterprise%20_White_Paper.PDF

This paper explores the impact of big data, the transformation of IC information technology, and how each will drive the necessity for an AF ISR strategic approach to data science.

DCS for ISR White Paper, ***Five Examples of Big Data Analytics and the Future of ISR***, November 2014

This paper describes the concept of big data and how it relates to ISR now and in the future through five examples. The paper asserts that big data is the new norm and intelligence professionals must adapt the way they employ data analytics to harness the depth of information now available.

DCS for ISR White Paper, *Revolutionizing AF Intelligence Analysis*, January 2014, http://www.defenseinnovationmarketplace.mil/resources/20140211_IntelligenceAnalysisWhitePaper_PA.pdf

This paper seeks to explain the increasing priority of analysis by identifying motivations, presenting a common lexicon, exploring key issues, and outlining the way ahead. The paper asserts that intelligence analysis is changing and increasing in prominence and therefore our analysis processes and emphasis must also adapt.

ISR Capability Planning and Analysis Process Committee on Examination of the Air Force Intelligence, *Capability Planning and Analysis to Optimize Air Force Intelligence, Surveillance, and Reconnaissance Investments*, National Academies Press, 2012

This report answers a request from the AF to assess the current AF approach to ISR corporate planning and programming. The report identifies best practices and recommends specific improvements to build-out existing tools and processes to ensure AF ISR processes can enable successful satisfaction of customer needs in accomplishing their missions.

Lin-Greenberg, Capt Erik, Krysten Young, and Col Brian Ray, *Improving Intelligence Analysis for the A2/AD Environment*, March 2015

This paper discusses the impact an Anti-Access/Area Denial (A2/AD) environment would have on the AF's ability to collect, analyze, and act on intelligence.

McClung, Lt Col Michael E., *2 Propositions Regarding Intelligence for Airpower*, Air University, 14 February 2013

This research paper provides two propositions concerning AF intelligence: 1) "the nature of intelligence for airpower is driven by the rapid evolution and expanding breadth of airpower itself" and; 2) "Analysis is the essence of intelligence for airpower, and like airpower it is broad, but targeting and threat analysis are central."

Report of USAF ISR Analysis and Production–CY 2014, 19 June 2014

This report is the result of a survey of AF ISR leaders to document AF production, including identifying production goals, focus, and areas for improvement. This survey built upon findings from a 2013 survey and further developed a baseline for comparison of the 2016 survey results.

Survey Report of USAF All-Source Intelligence Analysis, 1 August 2013

This report is the outcome of a survey to gage results and assessments of AF all-source analysis. The report asserts that if the USAF is serious about 'revolutionizing analysis,' it must concur with improved emphasis and investment.

Treverton, Gregory F., and C. Bryan Gabbard, *Assessing the Tradecraft of Intelligence Analysis*, Santa Monica, California: RAND Corporation, 2008, http://www.rand.org/content/dam/rand/pubs/technical_reports/2008/RAND_TR293.pdf

This RAND report is the result of a survey of the IC and other research to discover what constitutes intelligence analysis and how is it performed. The researchers found that "analysis" covers a range of activities that varies from organization to organization. The report concludes that to foster collaboration and shared understanding, common tools, agendas, and education curriculums should be established and shared across the community.

Treverton, Gregory F., and Jeremy J. Ghez, ***Making Strategic Analysis Matter***, Santa Monica, California: RAND Corporation, 2012, http://www.rand.org/content/dam/rand/pubs/conf_proceedings/2012/RAND_CF287.pdf
This RAND report is the result of a workshop that found that though there is not much demand for strategic analysis from policy and decision makers, there is substantial value in conducting this level of analysis.

A8.4. Analysis Scenarios and Historical Applications. Bruce, James B., and Jeffrey Martini, ***Whither Al-Anbar Province? Five Scenarios Through 2011***, Santa Monica, California: RAND Corporation, 2010, **http://www.rand.org/pubs/occasional_papers/OP278.html**

This report produced for the Marines by RAND analyzes the question, 'what does the future hold for Iraq's al-Anbar province?' The researchers play through five scenarios. The report concludes that the U.S. (and specifically the Marines) can influence some of the drivers shaping the scenario outcomes and suggests constant course of action evaluations to identify possible and probable future trajectories.

Ehlers, Robert S., Jr., ***Targeting the Third Reich: Air Intelligence and the Allied Bombing Campaigns***, University Press of Kansas, 2009
This book highlights the cooperative intelligence elements (Royal Air Force) and bombing elements (U.S. Army Air Force) of the allied forces in Europe during World War II. The text discusses the often overlooked value added by the combined intelligence-bomber efforts in crippling the German war-making capabilities.

Fukuyama, Francis, ***Blindside: How to Anticipate Forcing Events and Wild Cards in Global Politics***, Baltimore, Maryland: Brookings Institution Press, 2007
This book discusses the value, necessity, and difficulties for foreign policy analysts to anticipate wild card events (such as, the 9/11 attacks, the rapid emergence and spread of diseases like H5NI, and the collapse of communism) in world politics. The author points out that biases and political pressures often influence the prediction and likelihood assessments of these types of events. Additionally, the credibility of some assessments for the probability of these "wild cards" is questionable, with a "boy that cried wolf" tainted view.

Neustadt, Richard E., and Ernest R. May, ***Thinking in Time: The Uses of History for Decision-Makers***, 1st edition, New York: Free Press, 1986
This book provides methods decision-makers and analysts can apply from historical lessons to current decisions.

Taleb, Nassim Nicholas, ***The Black Swan: The Impact of the Highly Improbable***, 2nd edition, Random House Trade Paperbacks, 2010
This book defines and discusses "black swan" events. The author highlights the importance of considering black swans when conducting analysis and making judgments. Although rare, black swan events have occurred and may occur, with far reaching and dramatic consequences.

Vertzberger, Yaacov, ***Risk Taking and Decision Making: Foreign Military Intervention Decisions***, Stanford University Press, 1998
This book discusses the realities of risk and provides analysis of what elements impact risk judgments and preferences in individuals' decision-making. The author uses five case studies to illustrate the calculations and consequences of risks in military interventions.

Walton, Timothy, ***Challenges in Intelligence Analysis: Lessons from 1300 BCE to the Present***, Cambridge University Press, 2010

This work provides short, critical analyses of past scenarios that successfully or unsuccessfully employed intelligence analysis.

A8.5. Analysis Education and Training. Center for the Study of Intelligence, *The Future of Higher Education: Implications for Intelligence*, March 2015

This paper argues that because education models in formal education institutions have and continue to change, methods for training in the workplace must also change and adapt for new generations' learning styles.

Chang, Welton, and Philip E. Tetlock, *Rethinking the Training of Intelligence Analysts*, Taylor & Francis, 29 February 2016, http://www.tandfonline.com/doi/pdf/10.1080/02684527.2016.1147164#.V6SgAqpf3xg

This article discusses the continuing challenge of erroneous and/or incomplete intelligence assessments in the IC. The authors advocate for new training approaches for intelligence analysts that adopt a scientifically validated process, which regularly reevaluated against benchmarks.

A8.6. Deception Analysis. Barton Whaley, *Textbook of Political-Military Counterdeception: Basic Principles & Methods*, National Defense Intelligence College, 2007

This is a textbook on counterdeception. It is designed to help users think like a detective in employing analytical skills.

Godson, Roy, and James J. Wirtz, *Strategic Denial and Deception: The Twenty-First Century Challenge*, Transaction Publishers, 2008

This book considers whether globalization, proliferating communication technologies, and the dissemination of vast amounts of information make effective foreign denial and deception more or less likely.

Gooch, John, and Amos Perlmutter, *Military Deception and Strategic Surprise*, Digital Printing, 2007

The six essays in this book deal primarily with the theory of deception and strategic-level deception. They present a picture of the dynamics and potential benefits of deception. Examples of operational-level deception are mentioned in some of the essays to illustrate certain points.

Latimer, Jon, *Deception in War: The Art of the Bluff, the Value of Deceit, and the Most Thrilling Episodes of Cunning in Military History, from the Trojan Horse to the Gulf War*, The Overlook Press, 2001

This work shows how simple some tricks have been, but also how technology has increased the range and subtlety of what is possible—bogus radio traffic, virtual images, even false smells. He draws examples from land, sea, and air to show how great commanders have always had, as Winston Churchill put it, that indispensable "element of legerdemain, an original and sinister touch, which leaves the enemy puzzled as well as beaten."

A8.7. Analysis Policy and Guidance . This list is not intended to be comprehensive but rather to highlight several key resources.

AFI 14-133, *Intelligence Analysis*, 29 March 2016

As the keystone instruction for AF intelligence analysis, this publication codifies how the Air Force conducts and presents analysis capabilities in support of Global Integrated ISR and other service core functions. It establishes the standards for AF intelligence analysis and delineates the associated roles and responsibilities of AF ISR Enterprise organizations.

AFI 14-134, *Intelligence Analysis Production and Requirements Management*, 21 June 2016

This publication provides guidance and procedures on AF intelligence analysis production and requirements management in support of internal AF requirements, as an integral complement to the IC for DIAP-focused production, and in support of the annual AFISRPoA.

Air Force ISR 2023: Delivering Decision Advantage,
http://www.defenseinnovationmarketplace.mil/resources/AF-ISR_2023.pdf
This strategic document approved by AF/A2, discusses emerging and future challenges for the AF ISR Enterprise, and focuses on how the enterprise should posture to addresses these challenges while meeting enduring core missions.

Annex 2-0, ***Global Integrated Intelligence, Surveillance, and Reconnaissance***, 29 January 2015
The annex serves as an AF supplement to JP 2-0 and covers AF specific topics and perspectives on GIISR.

Commander ACC, ***GIISR Core Function Concept***, 23 Jan 2013
This document identifies five enduring core GIISR capabilities that directly support the JCA of Battlespace Awareness. Analysis is an essential and integral component of each of the five enduring capabilities.

DoDI 3115.17, ***Management and Oversight of DoD All-Source Analysis***, November 16, 2016
This instruction establishes DoD policy and assigns responsibilities for the management and oversight of DoD ASA. It also establishes the DIAAE BOG, an intergovernmental committee as the primary forum for DoD-wide analytic synchronization and integration.

ICD 203, ***Analytic Standards***, 2 January 2015
This directive establishes common analytic standards to be used across the IC to ensure clear communication among organizations.

ICD 204, ***National Intelligence Priorities Framework***, 2 January 2015
This directive establishes the NIPF as the mechanism to create, prioritize and share intelligence priorities.

ICD 206, ***Sourcing Requirements for Disseminated Analytic Products***, 22 January 2015
This directive establishes the sourcing information that must be included in covered analytic products so as to increase the credibility and transparency of intelligence analysis.

ICD 501, ***Discovery and Dissemination or Retrieval of Information within the Intelligence Community***, 21 January 2009
In pursuit of a culture of responsible sharing and collaboration across the IC, this directive establishes guidance and policies for the discovery, dissemination or retrieval of intelligence and intelligence-related information collected or analysis produced by the IC.

JP 2-0, ***Joint Intelligence***, 22 October 2013
This publication addresses the nature of intelligence and establishes the principles of joint intelligence. It is one of the base guiding documents for DoD IC organizations.

PREFACE

This publication is a roles and missions manual for G2/S2 sections. As the companion handbook to FM 34-8, this manual is written for officers serving as the G2 or S2 in combat, CS, and CSS units. It provides guidance for officers and NCOs assigned to G2/S2 sections. G2s should find this handbook a useful MTP when executing intelligence training responsibilities.

The proponent of this publication is the United States Army Intelligence Center and Fort Huachuca, Fort Huachuca, AZ. Send comments and recommendations on DA Form 2028 (Recommended Changes to Publications and Blank Forms) directly to Commander, US Army Intelligence Center and Fort Huachuca, ATTN: ATZS-TDL-D, Fort Huachuca, AZ 85613-6000.

This manual does not implement any ISAs. However, it complies with the following STANAGs:

- STANAG 2022, Intelligence Reports, Edition 8.
- STANAG 2077, Order of Battle, Edition 5.
- STANAG 2149, Intelligence Requests, Edition 5.
- STANAG 2844, Counterintelligence Procedures, Edition 2.
- STANAG 2936, Intelligence Doctrine, Edition 2.
- STANAG 6010, Electronic Warfare in the Land Battle, Edition 1.

It also complies with QSTAG 593, Mutual Support Between EW Units; and QSTAG 1034, Intelligence Preparation of the Battlefield.

Unless specifically designated, all references to the intelligence officer at corps, division, brigade, or battalion will be stated as S2.

Acronyms and brevity codes used in this manual are identified only in the glossary.

Unless this publication states otherwise, masculine nouns and pronouns do not refer exclusively to men.

Chapter 1

G2/S2 ROLES AND MISSIONS

WHY YOU NEED THIS HANDBOOK

The G2/S2 must provide continuous intelligence and information for the commander to conduct operations and minimize risk.

Intelligence is the commander's decisionmaking tool. The commander, who drives intelligence, does so for planning before deployment, while enroute, and during operations and redeployment. The S2/NCO—

- Provides the commander timely and accurate intelligence, IPB, I&W, and vulnerability assessments for force protection, targeting, and BDA.
- Makes decisive predictions on when and where an action will take place.
- Prioritizes IR.
- Integrates with other staff elements on I&S issues.
- Provides the commander with a view of all facets of the battlefield.
- Ensures his staff is trained.

PURPOSE OF THIS HANDBOOK

This manual does not replace the doctrine and TTP contained in the other FM 34-series manuals; it does, however, focus on their application. It also summarizes information that helps the S2 manage and coordinate the CCIR. It provides the S2 the roles and missions required for executing the intelligence support function.

The G2/S2 is the “Top Down”/“Bottom Up” integrator of RISTA operations, which have always been performed at the brigade and battalion levels. Three factors help to redefine traditional R&S planning:

- Top Down reporting.
- Bottom Up reporting.
- Digitization.

Systems and technologies available to units make an integrated approach to managing “top down” and “bottom up” reporting feasible. The ACT serves as the nexus of RISTA operations, digitally linking the brigade S2 with the automated capabilities of the DS MI company, resulting in RISTA operations which blend intelligence, R&S, and TA. (See FM 101-5 for G2/S2 responsibilities and Table 1-1 for RISTA collection resources.)

Table 1-1. Collection resources

IEW	RISTA
SIGINT	Troops in contact
IMINT	Other troops in contact (RAS)
HUMINT	Scouts (aerial & ground)
CI	LRS, SOF
MASINT	Countermortar & CB radars
TECHINT	Gun cameras
	Hand emplaced sensors
	CA, PAO, PSYOP

Chapter 2

FORCE PROJECTION

FORCE PROJECTION PRINCIPLES

Future Army operations will rely more heavily on the force projection of US combat power. There is no single method to support force projection. This chapter identifies key principles and considerations for planning and executing IEW force projection.

Successful force projection of IEW support is based on understanding and applying the key principles shown in Figure 2-1.

Other key force projection components are intelligence readiness and a requirement to define responsibilities each echelon performs down to the lowest tactical level. This chapter discusses—

- Intelligence readiness.
- I&W.
- Stages of force projection operations (minus operations).

Considerations are in a logical order but may not be sequential nor applicable for all force projection missions. Corps and division G2s must provide primary planning support for force projection operations because of their expertise. The S2 at each level identifies—

- Personal knowledge deficiencies (e.g., communications architecture, imagery dissemination systems and methods, ability to identify the staff's shortcomings).

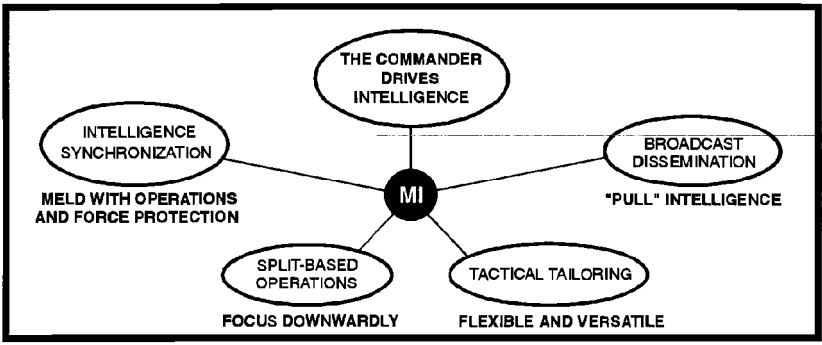

Figure 2-1. Principles of force projection IEW operations.

- Technical limitations (e.g., ASAS, SIDS capability).
- Intelligence gaps with adequate specifics.

INTELLIGENCE READINESS

In a JTF force projection operation, higher echelons will provide intelligence for situation and target development to lower echelons (top down) until the tactical ground force completes entry and secures the lodgment area. The JTF J2 may be reluctant to push everything down through tactical intelligence channels due to the volume of the intelligence information available. The S2 may receive support on a “smart push” basis, and needs to know his requirements to be able to do a “smart pull.”

The most significant change in the evolution of force projection operations is the enhanced information flow through hierarchical and non-hierarchical networks (computer, communications, and personal). The S2 should—

- Review available databases on assigned contingency AIs; conduct IPB on these AIs; and develop appropriate IPB products.
- Be aware of higher HQ SOPs and DIA manuals for specific CM guidance.
- Prepare, practice, and conduct information collection activities as part of in-garrison IO rehearsals.

- Preplan and practice an intelligence "surge" on likely contingency crises.
- Prepare and practice coordination from predeployment through redeployment with personnel from imagery, SIGINT, HUMINT, SWO, CA, PSYOP, and SF units, to include databases and connectivity.
- Ensure the following are a part of the daily operating environment:
  - — RC and other augmentation.
  - — Line numbers and SOPs including a linguist plan with proficiency scores (alert through early entry phases of deployment).
  - — Training (individual and collective).
- Form ad hoc intelligence links and networks early on to meet a developing contingency. Incorporate, request, and receive intelligence from unfamiliar sources (linguists, MI augmentation, other services); exploit NGOs and PVOs once a crisis emerges. Exchange communications protocols with theater and higher HQ and subordinate and lateral units.
- Forward all RIIs to the higher HQ IAW SOPs. The J2, G2, and S2 can focus intelligence downward based on the commander's needs.
- Understand the JTF J2's multiple echelon and broadcast dissemination capability to ensure NRT reporting to all deployed, in transit, or preparing to deploy forces.
- Maintain an intelligence database on the battlefield environment and threats for each contingency. The S2 must state and record the CCIR as PIR, subordinate SOR, and SIR, and include the following:
  - — For the battlefield environment, the commander's approval of the AI, to include separate ground, air, littoral waters, and political AIs.
  - — Maps, terrain, and weather products. Request from National Imagery and Mapping Agency hard copies (unclassified or at the lowest classification). Request authority to declassify these products locally.

— Digitized products (map sheets for ASAS, terrain data, and imagery).

— Physical environmental information. The TERRA BASE program allows S2s to template the effects of terrain on communications and direct fire. During mission analysis, TERRA BASE or other automated terrain products—WINCATS, TOPOSKINNER—provide the S2 a tool to help the commander visualize how terrain can affect friendly and enemy forces. These products can illuminate terrain effects for subordinate commanders in the OPORD brief. [Technique: Use the program at Home Station to develop and sustain proficiency.] The supporting engineer staff officer may also have terrain visualization products.

— Threat or potential threats. The intelligence community, primarily the NGIC, and open sources produce products useful for intelligence readiness. These products can be tailored to best support the commander. (See FM 34-3 for information on intelligence analysis.) INTELLINK will be an S2's primary access to any type of requested strategic intelligence. Examples of strategic level products include—

- Global security forecast.
- Battlefield development plans.
- Automated and hardcopy databases.
- Arms proliferation and military power studies related to the weapons acquisition strategies and the overall military power and potential of selected foreign military forces.
- TECHINT and User Bulletins.
- CIA World Fact Book and DIA country studies.
- Open source studies and articles.
- Other services.

INDICATIONS AND WARNINGS

Theater and national intelligence units monitor regional and global threats to

provide I&W intelligence to the NCA and military commanders. I&W intelligence flows to strategic, operational, and tactical commanders; it prevents surprise, reduces risk, and supports development and refinement of CONPLANs. The S2 must ensure the commander identifies PIR, IR, and targeting requirements for each assigned contingency area. The S2 should—

- Conduct CM and synchronization planning on I&W requirements. Review your unit's collection plan and preplanned SOR for each contingency area. If necessary, refine existing collection plans and SOR.
- Review and modify reporting procedures for I&W contingency areas. This may involve changing intelligence reporting (e.g., increasing reporting on one area and decreasing reporting on another) and message routing addresses and precedence (e.g., FLASH designation).
- Prioritize and forward SOR to higher headquarters.
- Disseminate intelligence and information to the commander, staff, and subordinate units.
- Coordinate for direct dissemination when possible.
- Recommend to the commander whether to maintain or increase unit readiness levels; plan and surge the intelligence effort for the impending operation; or move the unit from its current mission to contingency, branch, or subsequent operations.
- Adjust intelligence readiness steps according to pre-crisis I&W.

STAGES OF FORCE PROJECTION OPERATIONS

REMINDER: All phases of the intelligence cycle are being executed continuously during all stages of force projection.

MOBILIZATION:

Mobilization is a process in which the armed forces augment the AC capability in preparation for war or other national emergencies. It includes activating all or part of the RC assembling and organizing personnel, supplies, and materiel; and certifying the proficiency of individuals and units.

(See FM 100-17 for mobilization process.) In peacetime, AC and RC MI units plan, train, and prepare together to accomplish mobilization and deployment tasks. During the mobilization phase, the S2 should—

- Assist the mobilizing RC unit by preparing and conducting intelligence training and threat update briefings and by disseminating intelligence.
- Identify force requirements for the different types of operations and CONPLANs.
- Employ and adhere to existing procedures.
- If possible, use prior coordinated IMAs to fill gaps created by personnel shortages. These IMAs should already have a working knowledge of your SOPs and understand the mission.
- Monitor intelligence reporting on threat activity and I&W indicators.
- Conduct or coordinate CI and OPSEC training and operations.
- Manage IR and RII from your unit and subordinate units.
- Evaluate reporting.
- Update collection planning.

PREDEPLOYMENT ACTIVITY:

Predeployment activity provides the foundation for subsequent force projection operations.

- I&W will continue throughout force projection operations. The S2 must perform IPB early and continuously. (See FM 33-1, FM 34-130, FM 41-10.)
- Accelerated training will ensure all AC and RC MI units are able to conduct IEW operations. Integrate mobilization and deployment tasks into unit METL and training; emphasize and integrate critical aspects of force projection into battle tasks and planning.
- Focus broadbased knowledge to support CONPLAN refinement (IPB).

- Ensure tactical tailoring or split-based operation planning is based on an existing CONPLAN.

- Establish appropriate relationships; establish higher, lower, and lateral liaisons if they are different.

- Continuously conduct and update CM and IEW synchronization planning.

  — IO synchronization ensures IO are linked to the CCIR and respond in time to influence decisions and operations. IO encompasses more than just MI assets and requires MI support. (See FM 34-40 and FM 100-6.)

— IEW synchronization ensures IEW operations are linked to the CCIR and respond in time to influence decisions and operations. IEW is a subset of IO.

— The commander generates CCIR. CCIR focus on what is critical. They should change as the situation changes. CCIR affect PIR, IR, EEFI, and FFIR.

o Plan imagery coverage for target nomination, validation, and PSA.

o Require from collection assets, timelines for preplanned and dynamic collection requests.

o Plan synchronization through all five steps of the intelligence cycle.

o Ensure each PIR is related to a specific operational decision. (See FM 34-2 and FM 100-6.)

o Prepare an ISM and backward plan so collection production efforts are executed with the operation; deliver focused intelligence to support operational decisions.

o Coordinate with the S3 and signal officer for EW offensive and electronic deception operations, specifically for target nomination, no-fire target criteria, protected frequencies, and synchronized EW effort during all phases of the operation.

o Plan BDA requirements.

o Refine, manage, and update SOR. Monitor and maintain synchronization.

- Anticipate and initiate collection early against long lead-time requirements.

- Ensure CCIR process is continuous and the intelligence cycle and IEW operations remain tied to the commander's decisions and concept of operations.

- Identify collection gaps after you synthesize available information on the AO and coordinate the collection efforts of existing intelligence organizations. (Consider national, EAC, other US forces and services, and HN support.)

- Develop a collection strategy which factors PIR, IR, and METT-TC. Submit RII and other requests for support to adjacent, higher, and HN units. Develop a collection plan which supports all PIR and IR and maintains synchronization.

- Develop your intelligence team:

— *Commander's intelligence support*: The S2 and supporting MI commander form the maneuver commander's intelligence team. ASAS is the primary intelligence processing system supporting this team. A unit may need to augment its S2 staff, to include area experts, TECHINT LNOs, linguists, interrogators, intelligence analysts, and CI agents. Tailor the size and sophistication of the deploying unit's intelligence staff to the mission.

— *ACT*: The DS MI company provides an ACT to support the commander's intelligence team at brigade.

— *Additional attachments*: These could include PSYOP and CA.

— *DISE*: This is a small intelligence support team that provides communications, automated intelligence fusion, and broadcast downlinks in a small package capable of deploying with Army early entry forces.

- Decide whether you will form the DISE from the organic assets of the early entry force or from the corps ACE, supporting EAC MI brigade, or a combination thereof.

- Plan the configuration, which can range from "briefcases" (Mini-DISE) to HMMWVs (DISE vehicular), and are normally staffed by 5 to 12 soldiers, respectively. Build the supporting hardware systems around the Army's ASAS and integrate them with other Army, joint intelligence, and communication capabilities.

- Plan whether the DISE will expand to a full ACE as lodgment operations are completed or will disband once the mission is accomplished.

- Plan situations in which the DISE will go directly to higher headquarters for information without the home base's approval.

- Plan on requirements to support the DISE with 24-hour operations.

— *ISB*: This is the rear element of split-based operations that provides processed and analyzed intelligence to the DISE.

- Plan the automation, communications capacity, and personnel necessary to provide continuous intelligence requirements management, collection, processing, and reporting.

- Plan all procedures for the DISE to "pull" specific intelligence products and reports, obtain status of collection, and "push" the current intelligence picture from the lodgment back to the ARFOR and JTF commanders if not in theater.

— Plan all links to higher intelligence organizations, including the JIC and the elements designed to leverage theater intelligence; focus on support down to the corps and echelons below corps (e.g., the CMISE).

— Coordinate with and understand the capabilities of the JTF to include the NIST if formed.

— Plan to use RC augmentation. Some examples are a mix of CI agents, UAVs, interrogators, and linguists.

- Transportation availability (aircraft or naval vessel) for deployment.

- Sustainability.

- Portability once deployed.

- Disciplined operations. The commander's ability to collect may be affected by nonmilitary decisionmakers. The CINC can contribute to the deploying commander by ensuring at the outset that intelligence is decompartmented and releasable to allied units (if

applicable).

— Review applicable publications (ARs, DA Pamphlets, USSIDs).

— Review SOFAs, ROE, international laws, and other agreements. (Coordinate with SJA on these issues.)

— Review applicable NIMA guidance.

— Establish force deployment priorities based upon METT-T. Sequence initial required forces and capabilities, build-up priorities, and follow-on forces to ensure a sequenced plan, a tailored force, and established command and support relationships. Consider sensors, processors, preprocessors, CI, and HUMINT. Maintain unit integrity.

— Plan communications architecture (build redundancy when possible). Remember to—

  - Plan links to the JTF DISE, if formed, that complements the NIST. (See FM 34-25-3 and FM 34-37).

  - Ensure intelligence links provide the early entry commander vital access to multisource Army and joint intelligence collection assets, processing systems, and databases.

— Ensure collection is synchronized with production, and intelligence is still synchronized with operations (specify reporting procedures and timelines).

— Finalize the IEW OPLAN (terrain and communications deconfliction). Coordinate with the MI commander on his tactical decisionmaking process. Understand the MI commander's SOR that are his specified tasks, implied tasks, task organization, concept of operation (the organization, deployment, allocation, and employment of subordinate MI units), and coordination requirements with forward maneuver units.

— Establish the intelligence crossover point. Estimate the time and establish a measurable criteria to indicate when you have reached that point. Intelligence crossover occurs when enough tactical

collection assets are in theater to reduce the dependency upon strategic

or national assets. (See FM 34-1, Chapter 3.)

- Receive all augmentation and support elements quickly (ACT, DISE) and incorporate them within your unit, SOP, and training.
- Update databases to support the IPB process that will follow. Practice using INTELLINK.
- Support force protection. Intelligence operations—MDCI in particular—identify, locate, and target an enemy's ability to target and affect friendly forces, facilities, and operations. Intelligence support must—
  - — Conduct threat and risk assessment.
  - — Consider elements of fratricide avoidance:
    - Accurate target identification.
    - Collateral weapon effects.
    - Familiarity with supporting units.
    - ROE.
  - — Consider elements of force protection:
    - Information Warfare:
      - OPSEC.
      - Physical destruction.
      - PSYOP.
      - Deception.
      - EW.
    - COMSEC.
    - NBC.

- Personnel security.
- Neutrality maintenance.
- Personal awareness.
- Sniper threat.
- Counterreconnaissance.
- Arms and physical security.

— Using the MDCI process, assess and review friendly vulnerabilities and the threat's ability to exploit them.

- S2s should inform commanders and operators on CI and MDCI analysis.
- Train your MDCI analysts to conduct reverse IPB and think like the enemy S2, to include the enemy's perception of friendly centers of gravity and how he will attack or influence them.
- Incorporate your MDCI analysis into the G2/J2 situation and decision briefings and all planning (especially deception planning).
- Assign CI and MDCI sections appropriate missions and analytical responsibilities, such as rear area threat analysis, and continuously assess effectiveness.

— Identify potential countermeasures to deny the enemy access to friendly critical areas.

— Identify and recommend actions to counter enemy intelligence collection capabilities.

— Implement the following controls to support force projection:

- Establish access to national HUMINT and CI databases, automated links to joint service, coalition, and HN sources to help identify, assess, and develop countermeasures for threats. Develop FLASH precedence reporting procedures.

- Receive and disseminate CI information and specific CI tasks from ASAS and other means such as the CHATS.

- Support further CONPLAN and OPLAN development. MI units continually monitor and update their CONPLANs to reflect the evolving situation, especially during crises.

- Immediately before deployment, update deploying forces with the most recent intelligence on the AO and update your technical databases and situation graphics.

- Develop contingency tailored packages that allow the G2/S2 to place the right force support teams in a deployable posture with an adequate amount of training.

DEPLOYMENT:

Success in force projection operations hinges on the capability of airlift and sealift assets to move forces into the AO. Force protection is more critical during this stage.

- Monitor intelligence reporting on threat activity and I&W indicators. Continuously conduct and update IEW, CM, and synchronization planning.

- Plan enroute updates to eliminate information voids and allow your commander to adjust OPLANs prior to arrival in theater. Request supporting intelligence organizations use SATCOM, broadcast technology, and ADP systems to provide graphic and textual intelligence updates while enroute.

- Continue IPB.

- Provide timely, accurate, and specific infrastructure and weather information. IMETS can provide weather information.

- Use accurate situation development to help the commander understand and reduce risk on the battlefield.

- Use the DST, collection plan, R&S plan, ISM, and SOR to anticipate which decisions the commander and staff will make.

ENTRY OPERATIONS:

During initial entry operations, EAC organizations provide major intelligence support in a "smart push" mode. This support may include departmental, joint, and scalable Army intelligence elements capable of deploying forward. Entry units must continue to "smart pull" the intelligence they need for operations.

- Continue to conduct force protection planning.
- Monitor the buildup of the in-theater capability required to conduct sustained IEW operations and to reduce your total dependence on split-based, "top driven" intelligence from outside the AO. As organic IEW assets flow into the theater, assess their reliability for tactical intelligence. (National and theater organizations will still remain sources of strategic intelligence.) Determine intelligence crossover point.
- Monitor intelligence reporting on threat activity and I&W indicators.
  - — Routinely debrief troops.
  - — Use local nationals employed by or in frequent contact with your force to provide information (area experts must analyze it).
- Ensure liaison personnel and basic communications are in place prior to the scheduled arrival of parent commands.
  - — Deploy HUMINT forces into theater as early as possible.
  - — Contact HN or civil authority. (Contact CA units; see FM 41-10.)
  - — Contact other services.
  - — Contact lateral units.
  - — Coordinate with supporting CI unit for CI support to force protection.
- Emplace ACT, DISE, NIST, and other elements.
  - — Establish security.
  - — Establish communications.

- — Establish analytical capability.
- — Perform IPB.
- — Continue to conduct CM and intelligence synchronization planning. Recommend revised PIR and IR. Refine, manage, and update SOR. Evaluate reporting.
- — Consider space requirements, power, and logistical support for high use or unique items.

- Conduct situation development, target development, and support to targeting. During this stage as combat strength increases, your unit's organic tactical systems will conduct situation and target development (intelligence crossover point).

- Develop measurable criteria to evaluate the results of your collection plan. Reassesses—
  - — "Push" versus "pull" requirements.
  - — Communications architecture.
  - — Reporting procedures and timelines.
  - — Crossover point in intelligence.
  - — Intelligence support to OPLANs and OPORDs, branches, and sequels (to include planning follow-on forces).

WAR TERMINATION AND POSTCONFLICT OPERATIONS:

Upon cessation of hostilities or truce, deployed forces transition to a period of postconflict operations.

Commanders redirect PIR and IR to support units conducting restoration operations (e.g., engineer units conducting infrastructure reconstruction operations, medical and logistics units providing humanitarian relief). The nature of the PIR shifts from assessing threat forces to assessing political, economic, social, religious, and other conditions that affect force protection and the desired end-state; planning residual presence of US forces; and preparing for redeployment of forces.

- Continue to conduct force protection planning.
- Remain open to the possibility that hostilities could resume.
- Monitor intelligence reporting on threat activity and I&W indicators.
- Continue to conduct CM and intelligence synchronization planning. Update collection planning.
- Refine, manage, and update SOR.
- Evaluate reporting.
- Disseminate intelligence.
- Use pre-deployment tactical tailoring procedures to plan a phased redeployment of IEW assets and personnel ensuring continual coverage of the commander's requirements.

REDEPLOYMENT AND RECONSTITUTION:

As the combat power and resources decrease in the AO, force protection and I&W become the focus of the CCIR. This drives the selection of those MI units that must remain deployed and those which may redeploy.

- Monitor intelligence reporting on threat activity and I&W indicators.
- Continue to conduct force protection planning.
- Request intelligence BOS support (theater and national systems) and provide intelligence in support of redeployment and reconstitution (reverse intelligence crossover point).

DEMOBILIZATION:

Demobilization is the process by which MI individuals and units transfer from active to a premobilization or other approved posture. MI units resume intelligence readiness posture. RC MI units transition to peacetime status.

- Monitor intelligence reporting on threat activity and I&W indicators.
- Capture consolidated databases.

- Capture lessons learned via AARs (doctrine and TTP).
- Maintain intelligence readiness (e.g., training).
- Adjust MTOEs and evaluate the need for IMAs.

Chapter 3

MILITARY DECISION-MAKING PROCESS (MDMP)

MDMP in General

- FM 101-5 is the doctrinal source.
- The MDMP is a single, established, and proven analytical technique.
- The commander must follow the one-third/two-thirds planning rule.
- MDMP helps the commander and staff examine a battlefield situation and reach logical decisions.
- The commander can decide to use the complete or abbreviated version.
- Staffs should train on both the complete and abbreviated versions.
- Incomplete execution of the MDMP is a recurring deficiency at the CTCs.

Intelligence in the MDMP

- MDMP is based on continuous IPB, especially initial IPB during mission analysis.
- The commander drives intelligence; IPB is an integrated staff function driven by the commander.
- Train your section to conduct IPB so you can coordinate closely with other staff and BOS representatives.
- You must understand how all the BOS operate and how to integrate intelligence during planning, especially within the targeting process IAW FM 6-20-10.
- "Push" the staff to develop a robust and integrated R&S plan.

Staff Estimates

- FM 101-5 provides a generic staff estimate.
- The generic staff estimate is the base for the commander's operations, personnel, intelligence, logistics, CMO, communications, and special staff estimates.
- These staff estimates are designed to form, analyze, compare, and recommend friendly COAs.
- Staff estimates are continuous, must not be overly time consuming, and do not have to be a written product (time dependent).
- The wargame results and staff estimates help the staff compare COAs.

The Intelligence Estimate

- The purpose, scope, and content of the intelligence estimate changed with draft of FM 101-5.
- The old intelligence estimate was a text-based product derived from IPB that focused on ECOAs, capabilities, strengths, and vulnerabilities.
- This old intelligence estimate is functionally replaced by IPB products.
- A standard staff estimate prepared by the G2/S2 is the new intelligence estimate—it is radically different.
- The new intelligence estimate focuses on the G2/S2's ability to support friendly COAs and is used to compare and approve friendly COAs.

Step 1: Receipt of Mission ■ The mission comes from higher headquarters or is derived from an ongoing mission. ■ On receipt of a new mission, the G3/S3 issues a WARNO to the staff. ■ The staff immediately prepares for mission analysis (SOP preparation). ■ Immediately the commander and staff do a quick initial assessment with emphasis on an initial allocation of available time. ■ The commander issues his initial guidance, and the G3/S3 issues a WARNO to subordinate units.	**Intelligence in Step 1** ■ Collaborate with your higher G2/S2 before and during receipt of mission to facilitate the initial IPB. ■ As part of the initial assessment, look for gaps in your intelligence database and products. ■ Proactively request/prepare terrain products, weather, light, and climatology data; update the MCOO and doctrinal templates; maintain the enemy situation. ■ Focus on the initial time allocation (complete or full MDMP), R&S guidance, and any additional tasks or focus from the commander's initial guidance. ■ Establish/verify an IHL.
Step 2: Mission Analysis 1. Analyze the higher HQ order. (If confused by or you disagree with it, seek immediate clarification or resolution.) 2. Conduct initial IPB. 3. Determine specified, implied, and essential tasks. (It is important to understand specific requirements for each task.) 4. Determine the AI. 5. Review available assets. (The staff must identify additional resources needed to ensure the mission's success.) 6. Determine constraints (normally found in the scheme of maneuver, concept of the operation, and coordinating instructions). 7. Identify critical facts and assumptions. (List all appropriate assumptions from higher; state relevant conditions over which the commander has no control.) 8. Conduct risk assessment. 9. Determine initial CCIR. (Limit to 10 or less.)	**Intelligence in Step 2** ■ Intelligence and intelligence-related products: ❙ AI. ❙ Initial PIR (from the commander.) ❙ Initial OPSEC vulnerabilities and EEFI.***** ❙ MCOO and terrain as described by OCOKA and its effects. ❙ Assumptions (include enemy mission, objectives, threat BOS activities). ❙ Other elements of the battlefield. ❙ Situation templates (unrefined). ❙ Event templates and matrices (unrefined). ❙ Center/centers of gravity. ❙ HVTs. ❙ The IPB portion of the mission analysis brief and associated graphics (OB, weaknesses and peculiarities, activities and capabilities, and COAs). ❙ Collection plan (initial, G2 only).

10. Determine the initial reconnaissance plan. (The resulting R&S annex sets reconnaissance in motion.) 11. Plan use of available time. (The commander and staff refine initial plan for use of available time.) 12. Write the restated mission. Who, what, when, where, and why. 13. Conduct mission analysis briefing. (Given to commander and staff. The briefing is critical to ensure a thorough understanding of planning.) 14. Approve the restated mission. 15. Develop the initial commander's intent. A clear, concise statement of what the force must do regarding the enemy, terrain, and desired end-state. 16. Issue the commander's guidance. This provides additional guidance to focus staff planning. 17. Issue a WARNO. 18. Review facts and assumptions. When facts or assumptions change, the commander and staff must assess their impact.		The R&S plan (initial plan that starts R&S operations) and associated FRAGOs or WARNOs. | Intelligence estimate (initial). ■ These products are used to write Annex B to the OPORD or OPLAN and as the foundation for the DST* later in the MDMP. ■ Based on mission analysis, request information or intelligence based on intelligence gaps. ■ Develop as many ECOAs as time will allow. ■ Your higher HQ OPORD, OPLAN, and/or Annex B will task your unit to perform certain collection or R&S tasks. ■ Start the subsequent steps of CM & intelligence synchronization (FM 34-2) to support the initial collection plan (at a minimum SII, SIR, and SOR). ■ The R&S plan is a coordinated staff effort that must include FS, MEDEVAC, and CONPLANs (e.g., what the brigade does if 2 key scout sections are destroyed). ■ The MI Bn/DS MI Co participates in mission analysis and briefs the collection status and capabilities.
Step 3: COA Development 1. Analyze relative combat power. See FM 34-130 for estimating relative-force ratios. 2. Generate options. Goal is to develop COAs for every feasible ECOA; however, the commander usually limits that option with his guidance. 3. Array initial forces. Identify number of units needed and operational methods; develop a knowledge base to help make decisions. 4. Develop the scheme of maneuver. 5. Assign headquarters. This creates the task organization.	**Intelligence in Step 3** ■ Intelligence and intelligence-related products: | Situation templates (refined and prioritized). | Event templates and matrices (refined). | EWTL (initial).* ■ Ensure the G3/S3 uses the IPB facts, assumptions, and products developed during mission analysis and subsequently refined. ■ Work with the entire staff to ensure that friendly COAs take advantage of the environment and threat situation.*

6. Prepare COA statements and sketches. ■ The G3/S3 uses appropriate media to clearly portray how unit will accomplish the mission (e.g., scheme of maneuver).	■ Key on threat vulnerabilities. ■ Your input is critical in analyzing relative combat power. ■ Do not forget to support deception planning (when appropriate).
Step 4: COA Analysis (Wargme) 1. Gather the tools. 2. List all friendly forces. 3. List known assumptions. 4. List known critical events and DPs; include an HVTL list. 5. Determine evaluation criteria. 6. Select the wargame method. 7. Select a method to record and display results. 8. Wargame the battle and assess results. ■ The wargame is a critical and disciplined process used to visualize the flow of battle. ■ The commander selects the order of comparison of threat to friendly COAs. ■ The staff must evaluate the need for branches and sequels. ■ When technically possible, the staff should capture as much of the wargame on ATCCS as possible; otherwise, use a wargame worksheet or ISM. ■ These wargame results are key to developing DSTs and BOS synch matrix. ■ Use the action, reaction, counteraction method (consider at a minimum maneuver, FS, mobility, counter-mobility, survivability, and IEW). ■ The staff should track force ratios throughout the wargame.	**Intelligence in Step 4** ■ Intelligence and intelligence-related products: ❙ PIR with LTIOV (refined). ❙ HPTs. ❙ Confirmation of the enemy center/ centers of gravity. ❙ Situation templates (final). ❙ Some force protection issues (e.g., NBC vulnerabilities). ❙ EWTL (refined).***** ■ You wear both a "red" and "blue" hat in wargaming. ■ As the enemy commander you project enemy actions or reactions, develop DPs, and project enemy losses. ■ During the wargame you must address all relevant enemy BOS capabilities. ■ As the friendly G2/S2, you identify IR and NAIs; refine the situation template; and participate in the targeting conference. ■ Ensure the G3/S3 honestly portrays friendly capabilities during the wargame.***** ■ Work with entire staff to ensure friendly COAs take advantage of environment and threat situation. ■ Ensure HPTs, AGMs, and TSS support the operation.***** ■ The AGM is approved by the commander and addresses which targets will be attacked, how, when, and the desired effects. ■ TSS are criteria used in deciding whether to pass information as a target nomination.

	■ The MI Bn/DS MI Co commander and collection manager are important players at the wargame.
Step 5: COA Comparison ■ Used to identify COA that has highest probability of success. ■ Staff may use any technique; the decision matrix is the most common. ■ Staff gets its criteria from the commander (e.g., the principles of war or tenets of Army operations).	**Intelligence in Step 5** ■ Intelligence product: ❙ Intelligence estimate (final). ■ Ensure you play a key role during this step.
Step 6: COA Approval ■ If the commander modifies a proposed COA or gives the staff a new COA, staff must wargame that COA.	**Intelligence in Step 6** ■ Intelligence and intelligence-related products: ❙ PIR with LTIOV (approved). ❙ DST (an integrated staff product). ❙ BOS synch matrix.***** ❙ ISM. ❙ Event templates and matrices (final). ❙ The R&S plan (final).***** ❙ Collection plan (refined, G2 only). ■ Start the subsequent steps of CM and intelligence synchronization (FM 34-2) (i.e., development of new SII, SIR, and SOR). ■ If the commander designates you to perform BDA to support one of his decisions, you must thoroughly plan the BDA support and tie that plan into the collection plan.
Step 7: Orders Production ■ Based on the commander's decision and final guidance.	**Intelligence in Step 7** ■ Intelligence and intelligence-related products: ❙ OPORD or OPLAN Annexes B (Intelligence), L (R&S), P (C^2W)*****, Q (OPSEC)*****, S (Deception)*****, and T (EW).*****
***** The G2 participates in developing the products but is not the proponent.	

ACCELERATING THE MDMP:

The MDMP involves three techniques that can be applied in different situations: deliberate, abbreviated, and accelerated. Only the accelerated technique is discussed herein because it is the most difficult to implement. (See CALL Newsletter Update No. 95-12.)

The accelerated technique may be used when one or more of the following conditions apply:

- Commander has a staff available to assist him in developing the plan, but little time to use a more formal process.
- Commander does not have a staff, or the staff is not accessible.

When these conditions apply, the commander must rely primarily on TLP to develop his plan. The accelerated technique assists the commander in developing a tentative plan. Under extreme circumstances, this may be little more than a mental process; nonetheless, the commander can use it to assist him and key staff members (S2/S3/FSO/XO) as he develops his plan.

The accelerated technique follows the basic procedures in the deliberate and abbreviated processes, but the differences are more significant. The major differences between the abbreviated and accelerated techniques involve the commander's guidance and the COA development phase (Figure 3-1). The accelerated technique is characterized by active participation by the commander, and development of one COA that is suitable, feasible, and flexible.

In some situations, the products developed using the accelerated technique may be the same as those developed when using the deliberate or abbreviated technique. Because time is the key factor, the accelerated technique will normally result in the development of a FRAGO.

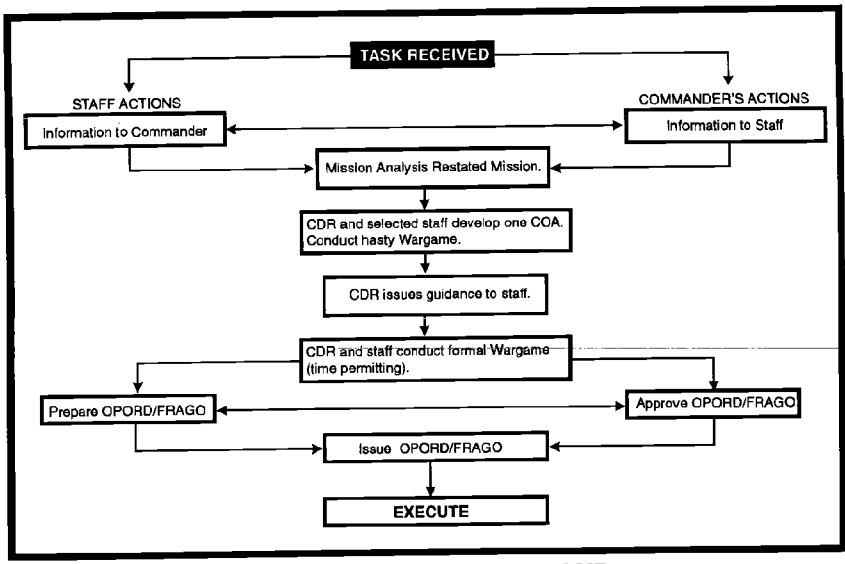

Figure 3-1. Accelerated MDMP.

MISSION ANALYSIS:

ISSUE: The commander and staff must be able to rapidly conduct the mission analysis to determine the restated mission.

DISCUSSION: When using the deliberate or abbreviated technique, the staff conducts a detailed mission analysis to develop the restated mission. As previously stated, resorting to a mental process in lieu of a detailed restated mission is acceptable; however, this should be the exception rather than the norm. The staff may be forced to brief their initial estimates orally, without the use of charts or viewgraphs. Conduct as formal a mission analysis as time allows. During the mission analysis, there are no major differences between the three techniques. There are no techniques that will significantly reduce the amount of time required to conduct the mission analysis. Anticipation, prior preparation, and experience by the staff are the keys to a timely mission analysis process.

TECHNIQUES:

- Commander must get personally involved by supervising and managing the mission analysis process.

- In extreme situations, the staff must be prepared to brief the commander without the use of visual aids.

COA DEVELOPMENT:

ISSUE: When time is severely limited, providing the commander's guidance after the mission analysis may not be the most appropriate time.

DISCUSSION: Instead, the commander may decide to immediately begin personally developing *one* COA with input from selected staff officers. There is probably not time to seek input from every staff officer, so the commander must determine relevant and critical staff officers (e.g., S2, F3, FSO, XO). This team may vary depending on the type of mission. For example:

- In the defense include staff engineer.

- During SASO include CA, PAO, SJA, PSYOP.

- In other situations, include subordinate commanders because of their experience.

This team must then quickly develop a flexible COA to accomplish the mission. The key to success, when using the accelerated technique, is to rapidly develop a base plan with appropriate branches that is flexible, feasible, suitable, and acceptable. *DO NOT WORRY ABOUT DEVELOPING THE PERFECT COA; THERE IS NOT TIME FOR IT*. This is the major distinction between the accelerated technique and the others.

Once the COA is developed, the commander might consider conducting a hasty wargame. In extreme situations, this may be the only opportunity to conduct the wargame process. Next, the commander should begin to quickly develop his guidance to the staff. The accelerated technique is

characterized by an active role of the commander, and very specific guidance to the staff.

TECHNIQUES:

- Focus on developing one COA with branch plans that is flexible, feasible, suitable, and acceptable.

- The commander plays the central role when developing this COA.

COMMANDER'S GUIDANCE:

Once the commander has developed the COA, he must issue guidance to his staff so it can refine and wargame the COA. The commander's guidance to the staff must be directive and specific. The staff's responsibility is to support the commander's plan, not to develop the perfect plan. Well-developed and clearly communicated commander's guidance can be a significant timesaver. The commander's guidance should serve to keep the staff focused by establishing parameters to work within. Commander's guidance must be constantly reviewed and analyzed. As the situation changes and information becomes available, the commander may have to alter his guidance to the staff.

COA ANALYSIS:

ISSUE. The commander and staff must rapidly conduct the COA analysis process.

DISCUSSION: Conducting the wargame process using the accelerated technique is the most difficult of the three processes because only one COA was developed. The purpose of the COA analysis is not to analyze and compare multiple COAs that result in a recommendation to the commander, but to synchronize and integrate the commander's directed COA. This wargame session should focus on refining the branches or contingencies to the base plan and follow the formal wargame process as much as time allows. Focus on the most critical events. You do not have time to wargame the entire operation. When wargaming using the accelerated technique, the commander's involvement is even more important. The staff should use the box technique, focusing on actions at the objective or the engagement area. If time permits, wargame other critical events as well. The staff must work to support the commander's plan. However, as the staff works to refine the plan, it cannot become so biased that it develops a plan that is infeasible and insupportable. If the staff determines that it cannot support the commander's plan, then a new COA must be developed.

TECHNIQUES:

- If time permits, conduct a hasty wargame session during the COA development step. Ensure you identify and develop branches to the base plan.
- Involve the commander. He must supervise the wargame session, actively participate, make decisions, and provide guidance as required.
- Use the box technique, focusing on the most critical event first.

DECISION:

When using the accelerated technique, a decision brief is not required because only one COA was developed. The only decision that may be required is if the developed COA becomes unsuitable, infeasible, or unacceptable. If this occurs, another COA must be developed.

ADVANTAGES:

- Requires less time.
- Facilitates adaptation to a rapidly changing situation.
- Allows commander to compensate for lack of a staff or an experienced staff.

DISADVANTAGES:

- Significantly limits staff initiative and flexibility.
- Very directive, explores only one friendly COA.
- May result in only an oral order or FRAGO.

CHAPTER 4

S2 OPERATIONS CHECKLISTS

Intelligence operations will usually begin with a notice tasking statement. CONPLANs, training, the N-Hour sequence, and the MDMP contribute to mission readiness. The S2 can use the following checklists to monitor intelligence readiness prior to receipt of a mission and subsequently to verify preparations and facilitate mission planning.

The timelines used could apply to any echelon.

- Mission Checklist (Table 4-1).
- N-Hour Critical Times (Table 4-2).
- N-Hour Critical Actions List (Table 4-3).
- Mission Planning Sequence (Table 4-4).
- Reconnaissance Planning (Table 4-5).

Table 4-1. Mission checklist .

Mission Day Minus	ACTION	REMARKS
A-28	Notify attachments to provide updated access rosters prior to A-Day.	
	Provide open access to national and strategic databases.	
	Initiate verification of clearances within battalion.	Include sensitive positions and RTOs.
	Coordinate security briefings for unit personnel.	Include all OPSEC program components and SAEDA program.
	Coordinate contingency AI briefings.	
	Verify access to intelligence databases through division or higher.	Disseminate hard copy products to subordinate units.
	Inspect unit areas and equipment for physical security deficiencies.	Coordinate for support and access. Check equipment compatibility.
	Review section files.	Designate deployable and nondeployable records.
	Obtain current TECHINT/User Bulletins and DIA Top Ten Equipment Acquisition list from 203d MI Bn (TECHINT).	Acquire information on disposition directives from JCS and theater commander.
A-21	Obtain higher HQ access roster.	Update as required throughout mission cycle.
	Coordinate security force requirements with tasked units and MP.	
	Identify linguists in unit or update current file.	Provide list, crosscheck with S1 data.
	Provide updated list of telephone numbers to be cut off at N+2 to the S1.	
A-14	Finalize security plans and instructions.	Check guard/MP patrols.
A-8	Coordinate security requirements for filler personnel.	Barrier material, lighting, container seals, security of vehicle holding area, motor pool, empty barracks.

Table 4-1. Mission checklist (continued).

Mission Day Minus	ACTION	REMARKS
A-8	Prepare DA Form 3964 for classified material transported with deploying elements.	
	Brief MI battalion LNO on duties.	
A-7	Finalize MI battalion personnel and equipment support list.	Ensure copy placed in SDO book.
	Update section alert notification roster.	
	Continually monitor intelligence WATCHCON levels.	
A-4	Check alert rosters in SDO book and completion of all unit OPSEC and SAEDA briefings.	
A-Day	Brief RDC on battalion security plan.	EEFI material, handle accordingly.
	Issue guard instructions.	
	Provide access rosters to rear detachment personnel, higher and supported HQ.	

Table 4-2. N-Hour critical times.

N-Hour	EVENT	REMARKS
N-Hour	Notify and assemble units.	
	Initiate telephone control.	
	Initiate area security plan.	
	List questions for N+2 brief.	
N+1:30	Prepare staff equipment to go to staging area.	
	Verify basic load, load plans.	Maps, batteries, etc.
N+1:45	Depart for N+2 brief location.	
	Distribute updated access roster.	
	Secure battalion conference room.	
N+2:00	Present N+2 briefing.	
	Coordinate with CI to initiate OPSEC plan; inspect battalion area for physical security violations.	
N+3:30	Present the intelligence estimate.	
N+3:45	Confirm transfer of company arms room keys to the rear detachment S2 before departing to staging area.	
	Verify security clearances of attachments through supporting S2.	
N+4:30	Sweep battalion area with CI personnel.	
N+5:00	Impose restrictions on incoming/ outgoing mail.	When given proper authority.
N+6:30	Issue OPORD at staging area.	
N+8:00	Ensure rear detachment is briefed on security.	
	Provide latest intelligence update to commander and staff. Have LNOs, DS MI CDR attend.	

NOTE: Modify times depending on mission requirements and SOPs.

Table 4-3. N-Hour critical actions list.

H-HOUR		ACTION	ACTION OFFICER(S)
	_____	Mission Receipt	
1	_____	WARNO----------	CDR, S2/S3
-	_____	Do IPB----------	S2 (w/asst from ENGR, Terrain, Weather, etc)
2	_____	Mission Analysis	
2	_____	Brief Mission to CDR----------	Coordinating Staff
-	_____	Initial CDR's Guidance	
2	_____	Do COAs----------	CDR, S2/S3
3	_____	Staff IPB & COAs----------	S2, S3
4	_____	Do Staff Estimates----------	Unit Staff
-	_____	COA Analysis (wargaming)----------	CDRs, Unit Staff
5	_____	Select Best COA----------	S3, Selected Staff
6	_____	Do DST----------	S2/S3, FSO, ADA, ENGR, SIG, CHEM
5	_____	Brief DST	
7	_____	Brief Selected COA----------	Selected Staff
-	_____	CDR's Decision	
7	_____	WARNO Scouts/Patrols Recon----------	S2/Asst S2/BICC officer/S3
8	_____	Mission Brief	
8	_____	OPORD Prep/Staff Coord----------	Unit Staff
8	_____	Turn in OPORD Annex	
9	_____	Proof OPORD	
10	_____	Issue Targeting Overlay----------	FSO
11	_____	Brief Scouts/Patrols Recon----------	S2/Asst S2/BICC officer/S3/ENGR/FSO/ADA
12	_____	Execution Matrix----------	S3
13	_____	BOS Synchronization Matrix----------	Unit Staff
14	_____	Maps/Charts Prep----------	Unit Staff
14	_____	CDR's Map Updated----------	S2/S3
15	_____	OPORD Rehearsal----------	XO, S3
16	_____	OPORD Briefing----------	XO
17	_____	Initial Backbrief	
17	_____	TF CDR Brief Higher HQ----------	CDR, S2, S3
17	_____	Co/Bn CDR Backbrief	
18	_____	Rehearsal----------	Unit Staff, CDR
19	_____	Final INTEL Update----------	S2
	_____	LD/LC	

NOTE: These items are not listed in a definite order; some may not occur at all.

Table 4-4. Mission planning sequence .

S2 ACTIONS UPON RECEIPT OF A MISSION:

1. Receive and analyze mission:
   - Receive CDR's guidance and assist in development of CDR's PIR.
   - Understand CDR's intent.

2. Define the battlefield environment:
   - Identify AO and AI.
   - Identify battlefield characteristics that will influence friendly and threat operations.
   - Identify intelligence gaps.
   - Develop preliminary IR.
   - Identify specified and implied intelligence tasks:
     - **Specified:** From OPORD Annex B, R&S Appendix, tasks to subordinate units, MI task organization for combat, coordinating instructions, and collection plan.
     - **Implied:** Mission dependent METT-T.
       M—**Mission** (CDR's intent, PIR, scheme of maneuver).
       E —**Enemy** (OB and IPB to develop collection IR).
       T—**Troops** (Organic and Higher Assets).
       T—**Terrain and Weather** (R&S asset LOS, LOCs, obstacles, weather effects on system's collection ability).
       T—**Time Available** (Plan, Move, Operate, Report).
   - Determine availability of organic/attached/supporting intelligence assets.

3. Request support/information from higher HQ if items/information are not available organically:
   - Maps/Imagery/sketches/blueprints of objectives, NAIs.
   - Collection plan, asset available times and asset tracks.
   - Weather - light data and climatic summary.
   - Enemy OB data.
   - Terrain products (LOC/vegetation/CCM/MCOO/elevation/LOS/hydrology).
   - Higher R&S plan.
   - Determine R&S assets you and higher HQ will control (intelligence architecture).
   - Determine availability, coordinate intelligence support from non-MI systems and organizations (AN/TPQ-36/37, OH-58D, FISTV, AN/TPS-25A, AN/TPS-58B, Engr, Co/teams, Cavalry, chemical units).
   - Obtain SOI; sign and countersign information through unit SIGO.
   - Advise higher of your recommended PIR and expected intelligence gaps.

4. Distribute maps, imagery, and sketches (maintain accountability).

5. Brief staff on abbreviated intelligence estimate to assist their mission planning.

6. Issue WARNO to R&S assets.

7. Describe the battlefield's effects:
   - Analyze terrain.
   - OCOKA factors.
   - Effect on friendly and enemy operations.
   - Analyze weather effects on terrain, troops, equipment, and friendly and enemy operations.

Table 4-4. Mission planning sequence (continued).

8. Assess other characteristics of the battlefield (mission dependent):
   - Politics.
   - Population.
   - Demographics.
   - Social ethnic/Religion.
   - Economic

9. Evaluate threat:
   - Evaluate enemy OB, current disposition and strength, committed and reinforcing units (maneuver, artillery, engineer, ADA, NBC, UW, air, intelligence assets, smoke, E-O sensors) and current significant activities.
   - Evaluate threat capabilities and tactics.
   - Develop/refine intelligence database and threat models.
   - Prepare doctrinal templates.
   - Prepare threat critical event lists.

10. Determine ECOAs:
   - Use doctrinal templates to develop event and situation templates (include all forces that can affect mission completion), AAs and MCs.
   - Identify enemy mission and intent.
   - Determine (in simple terms) how the enemy sees us acting in this operation.
   - Determine how the enemy is currently disposed and what must be accomplished to get from now to his desired end state, given that this ECOA must account for our actions determined in 3 above.
   - Determine enemy concept of the operation and subunit tasks. How will each of the following contribute to accomplishing the intent determined in 2 above:
     - Maneuver.
     - RISTA.
     - FS.
       - Artillery/mortars/rockets.
       - CAS.
       - Aviation.
       - NBC weapons.
       - EA.
     - Air defense - Recommend task organization for MI assets.
   - Identify most likely and most dangerous ECOAs.
   - Identify IR and NAIs for each friendly COA identified; TAIs with S3/FSO for each COA.
   - Develop HPTs for each friendly COA with S3/FSO.
   - Assist in developing HVTs for each ECOA.
   - Integrate EA into targeting.
   - Determine BDA criteria (damage required for each target, a means to determine damage).
   - Finalize and prioritize PIR (obtain CDR's approval).
   - Define indicators and SIR.
   - Send WARNO on threat to subordinate units to facilitate planning.

11. Develop ISM:
   - Tie to PIR/IR (include LTIOV).
   - Include timeline, required decisions, decision criteria, SIR, collection assets.
   - Plan for system cross-cue, back-up coverage.
   - Ensure it answers CDR's requirements for intelligence, targeting, and BDA in time to make decisions.

Table 4-4. Mission planning sequence (continued) .

- Participate in staff wargame of DST and targeting plan (as opposing CDR).
- Never hold MI assets in reserve.

12. Develop R&S plan and overlay to support DST (with support from S3/FSO/ENGR/ ADO) (see **Reconnaissance Planning** below):
- Determine indicators, SIR, NAIs, DPs, TAIs.
- Ensure NAI/TAI support synchronization or R&S plan with fire plan and scheme of maneuver.
- Identify intelligence gaps and request collection support from higher (RII).
- Develop communications plan/reporting schedule.
- Wargame R&S and collection plan.
- Update ISM, R&S, and/or collection plan.
- Receive, consolidate, and deconflict subordinate R&S plans and overlays.
- Consider "Reconnaissance Fundamentals" [Maximum reconnaissance force forward, orient on the location or movement of the reconnaissance objective, report all information rapidly and accurately, retain freedom to maneuver, gain and maintain enemy contact, develop the situation rapidly (FM 17-95).]
- Consider "R&S Principles" [(1) Tell the commanders what they need to know in time for them to act and (2) Do as much as possible ahead of time (FM 34-2-1)].

RECONNAISSANCE PLANNING

While the DMP for reconnaissance operations is conducted in the same manner as for any other combat operation, the following steps will assist the reconnaissance planner in ensuring that the unique features of reconnaissance operations are addressed.

Reconnaissance Mission Analysis

■ Identify Reconnaissance Objectives. Reconnaissance mission analysis must identify the objectives of the unit's reconnaissance effort. These objectives are obtained from—
- PIR.
- DPs.
- HPTs/HVTs.
- Confirming Events. (These are enemy actions and counteractions that confirm an ECOA and are determined by event analysis.)

The reconnaissance planner may determine that some of the above requirements may be accomplished by RFIs to higher HQ, but all of those that are not must become reconnaissance objectives.

■ Identify Reconnaissance AO. Reconnaissance planners identify the area in which reconnaissance forces will be operating, either specified by control measures such as LOAs or CFLs or implied by the location of reconnaissance objectives.

■ Restate Reconnaissance Missions. Once reconnaissance objectives have been determined, the mission for each element of the unit reconnaissance force must be determined from task analysis and stated as a subunit task. The task analysis process—determining specified, implied, and essential reconnaissance tasks and identifying limitations and constraints—is described in FM 101-5. Reconnaissance missions will be determined to be reconnaissance-in-force or zone, area, route, or force-oriented reconnaissance missions.

■ Identify Available Reconnaissance Force. Reconnaissance planners must identify the subunits that are available to execute the unit's reconnaissance effort and their current and projected status.

Table 4-4. Mission planning sequence (continued) .

■ Identify Available Equipment. Reconnaissance planners must identify the equipment available in an FMC status that will be used by elements of the reconnaissance force to accomplish reconnaissance tasks.

RCOA Development

■ Identify Required Reconnaissance Force. Reconnaissance planners must identify the force required to accomplish the unit's reconnaissance objectives. The number and type of elements involved will be based on the following:

- Number, type, location, and sequencing of reconnaissance objectives. Some objectives will require constant surveillance. Some will be time-phased and need only be observed for part of the battle. Some elements of the reconnaissance force will be able to accomplish several reconnaissance objectives.

- Type of reconnaissance mission. A route reconnaissance will require a different element than a reconnaissance-in-force.

- Strength, composition, and disposition of enemy security force. For each element of the reconnaissance force, the decision will have to be made whether it will have to infiltrate or penetrate the enemy security force. Infiltrations dictate stealthy elements and techniques while penetrations will require the correct reconnaissance force ratio.

■ Identify Required Equipment. Each reconnaissance objective will require specific reconnaissance equipment based on the following:

- Proximity of the reconnaissance element to the objective. What is the effective observation range?
- Environmental conditions. What will be the impact of severe weather? Night?
- Signature provided by the target. Does it emit a signal? Heat? Does it need to talk to anyone?

■ Determine the Reconnaissance Scheme. The RCOA must ensure that all reconnaissance objectives are addressed by elements of the reconnaissance force that can provide the read on the objective required by the commander. The reconnaissance force must therefore be in the right place, at the right time, and with the right observation, communications, and force protection equipment. The RCOA must deploy the reconnaissance force in depth to ensure that contact is not lost with moving reconnaissance targets. It must identify reconnaissance objectives that cannot be addressed so that RFIs may be prepared or risk accepted. In developing the RCOA, reconnaissance planners must answer the following questions:

- Are all PIR, HPT, DP, and confirming events addressed as reconnaissance objectives or RFI?
- What role will other BOS/combat operations play in the reconnaissance scheme?
  - FS (to include EA and SEAD for air insertions/extractions).
  - Air defense.
  - Mobility/counter-mobility.
  - CSS.
  - Deception.
  - OPSEC.
- How will this RCOA—
  - Maintain focus on the reconnaissance effort?
  - Gain and **maintain** contact with reconnaissance targets?
  - Provide early warning?
- How will we ensure that reconnaissance operations remain the bde/TF initial main effort?

Table 4-4. Mission planning sequence (continued) .

- What is the reconnaissance force's relationship with security force?
- How far forward will we conduct reconnaissance? Is there a force in front of us? What are the control measures?
- How will fire support be integrated into this RCOA?

■ Determine Task Organization, C^2 Relationships. Once the reconnaissance force and its associated equipment are determined, it must be task organized to accomplish the RCOA in the most efficient manner. The C^2 structure must address unity of effort by identifying the COR. **The COR must have the control structure and authority to direct the reconnaissance force.** Reconnaissance operations often take place over large distances and long periods of time where communications systems are subject to attack. The communications plan will require careful attention to the use of retransmitted teams and redundant systems.

■ Identify Control Measures. While reconnaissance operations require the same positive control measures as any other, some require special attention.
- LOA. This measure identifies the forward edge of the reconnaissance battlespace and is usually associated with a CFL or FSCL.
- BHL. Reconnaissance forces operate throughout the unit's AO, but must be able to coordinate the acceptance of reconnaissance targets entering their battlespace with the unit to their front.
- TF Forward Boundary. In brigade operations there will often be a need to identify a brigade zone forward of the subordinate maneuver TFs.

■ Determine CSS Requirements:
- Resupply: How often, by whom, where, how?
- CasEvac: By whom, how?
- Reconstitution: From where will reconstituted reconnaissance forces come? What are the priorities?

RCOA Analysis and Wargaming

■ Key Events to Wargame During Analysis of an RCOA:
- Infiltration or penetration of the enemy security force.
- Insertion/extraction methods.
- Backup communications plan.
- CasEvac operations.
- Change in reconnaissance objectives based on new information.
- Handover of reconnaissance target leaving reconnaissance unit's LOS or AO.

R&S Ten Keys To Success

1. Commander's intent and **CCIR** drive R&S.
2. Support **R&S** early with integrated staff products.
3. Be adept at abbreviated **IPB** for **Quick** or **Combat Decision Making Process.**
4. S2 focus on the event template to capture the moving enemy.
5. S2 then provides **situation template,** depicting enemy in the engagement area.
6. Use automation tools like **ASAS** to enhance products.
7. Deploy organic R&S assets early and request support from higher. Issue S3 **FRAGO** with S2 graphic overlay.
8. Provide continuous coverage throughout the depth of the battlefield.
9. Use all possible assets from national level to scouts.
10. Evaluate reporting and provide **immediate and continuous feedback** to the commander.

APPENDIX A

UNIT INTELLIGENCE TRAINING CHECKLIST

This checklist will help a newly assigned brigade or battalion S2 maintain technical and tactical intelligence proficiency. Its building-block approach is systematic. The phases are supported by tasks to be completed for certification during the time specified. Some tasks may not apply to a particular echelon of staff.

PHASE I - ORIENTATION PHASE

This phase covers basic orientation to the division and the unit's mission. **This phase should be completed within the first 30 days** . The goal is to quickly acquaint the S2 with an understanding of the battalion, brigade, and division roles within corps, possible missions, and deployment areas.

Initial/Date	Task
_____	Coordinate with and receive briefing from outgoing S2.
_____	Review unit's intelligence library of publications listed in Appendix J.
_____	Read unit METL and latest training brief to determine overall unit missions and status.
_____	Receive unit CDR in-brief.
_____	Talk with unit CDR; ask what are his desires for intelligence and intelligence products. Tailor intelligence to the needs of the CDR.
_____	Visit and receive briefing from ACofS G2, Deputy G2, G2 Operations Chief, G2 Plans Chief, G2 Training Chief.
_____	Meet with subordinate S2's and gain an understanding of—
_____	● Their commander's intelligence priorities.

- Personnel and equipment status.
- Training proficiencies and deficiencies.
- Areas where they need your echelon's help.

Visit MI battalion or DS MI Co commander for unit and equipment briefings, display, and demonstrations.

Study division, brigade, and battalion OPLANs.

Review and evaluate intelligence annex to unit SOPs. (Use FM 34-1, FM 101-5, your SOP, and intelligence annex to the division SOP.) Provide CDR an updated evaluation of the unit intelligence annexes. Develop an SOP if one is missing or outdated.

Receive an organizational and functional briefing from the next higher G2/S2.

Study the CDR's current PIR and IR as developed.

Meet and discuss intelligence missions, products, and training with the—

- Scout platoon leader.
- GSR platoon leader.
- Local division CI team.
- ACT.
- ACE Chief, IPS Chief, and CM Chief.
- EWO.
- Terrain detachment team.

Determine all organic or assigned division intelligence collection assets that may support collection efforts. (See Appendix G.)

Learn to use section's automation equipment and programs.

_____ Learn the connectivity, reporting, and requesting procedures.

_____ Meet with next higher echelon G2/S2 to discuss the CM process.

_____ Review unit's collection plan.

_____ Become knowledgeable of the unit's and division's FSOP, RSOP, and deployment procedures.

_____ Read unit and division history.

_____ Obtain SI access through the SSO and review SCI billets for unit.

_____ Review unit's arms room security SOP.

_____ Inventory all sensitive items in one company.

_____ Review key control program SOP.

_____ Review physical security and crime prevention SOP.

_____ Receive a crime prevention and physical security program briefing from the MP and Directorate of Security.

_____ Become familiar with the S2 section vehicles and generators, as necessary.

_____ Become familiar with the TOC SOP, setup, and multisystem, multiechelon connectivity.

_____ Visit G2 training for intelligence training products.

_____ Test an arms room’s J-SIIDS.

_____ Visit unit staff sections and attached sections from other units (FSO, ADA, NBC, SOCCE, and ENGR).

_____ Develop and implement a detailed internal security inspection program that covers intelligence areas within the unit.

_____ Develop working relationship with higher echelon G2/S2.

_____ Review mission and section METL and battle tasks. Have section members give their assessment of current training level.

PHASE II - FUNDAMENTAL PHASE

This is the most critical phase for the newly assigned S2. The knowledge, insight, and assessments of I&S will establish the foundation for future development. This phase focuses on the IPB process, intelligence production and dissemination, collection operations, and security. **This phase should be completed within 90 days** .

Initial/Date **Task**

_____ Present to unit personnel an officer professional development class on the threat.

_____ Update unit's collection plan as needed; submit revisions to the CDR and forward a copy to higher HQ G2/S2.

_____ Brief the CDR on division and corps IEW assets.

_____ Brief next lower units on division and corps IEW assets.

_____ Inspect unit map program. Identify basic map load and training requirements.

_____ Inspect and evaluate unit training for intelligence tasks, including awareness of AR 381-10.

_____ Determine country and area study requirements from open and classified sources based on contingency and assigned OPLANs.

_____ Begin country studies.

_____ Understand additional duty responsibilities as required:

_____ ● Security manager.
_____ ● Physical security officer.
_____ ● Personnel security officer.
_____ ● Crime prevention officer.
_____ ● Key custodian.
_____ ● Top secret document custodian.
_____ ● Information systems security officer.

_____ Receive briefing and training from unit SIGO on communications procedures and communications equipment PMCS.

_____ Become familiar with capabilities, limitations, and vulnerabilities of unit's equipment (tanks, Bradleys, other assigned, attached, DS systems, or OPCON BOS operating in the unit's battlespace; particularly the TA and information dissemination capabilities).

_____ Update, as needed, the unit's—

_____ ● Arms room SOP.
_____ ● Physical security SOP.
_____ ● Key control SOP.
_____ ● Crime prevention program.

_____ Conduct random unannounced security spot checks. Report the results and any recommendations to the CDR.

_____ Brief CDR on the unit's intelligence estimate.

_____ Brief CDR on the intelligence collection and reporting system from platoon through corps.

_____ Develop, update, and evaluate an S2 section METL and battle tasks.

_____ Be knowledgeable on CTC threat vehicles, E-O devices, doctrine, and tactics. Teach a class on this subject at least once in this phase.

_____ Visit nearest battle simulation center and become familiar with computer operations.

_____ Visit and observe training of primary weapon systems in the division.

_____ Understand current division policy on CONUS and OCONUS transportation of classified material.

_____ Work with commanders. Ask what intelligence they want during FTXs and OPORD briefings.

_____ Know how to read a TACFIRE direction system message. Let FSO know you want to receive these during FTXs and deployments.

_____ Work with FSO to develop and review unit targeting and BDA procedures.

_____ Know unit air LNO. Request BDA and in-flight reports that will bolster reporting.

_____ Obtain recent CTC and applicable CALL. Develop plan to correct any deficiencies.

_____ Obtain inspector general checklist and CIP checklists; conduct internal inspection on all S2 functional areas. Brief CDR on inspection results and solutions.

_____ Review language proficiency requirements; assist S3 in coordinating training. Retain list of unit's capabilities; include unpaid abilities.

_____ Conduct classified materials inventory; learn destruction and verification methods; review destruction and transfer SOPs.

_____ Constantly review clearance requirements, applications, and updates.

PHASE III - DEVELOPMENTAL PHASE

This phase will build and expand on the knowledge gained during Phase II. It will cover the same basic intelligence functions but in greater detail. **This phase should be completed within 180 days.**

Initial/Date	Task
_____	Fully understand the functions of the S2 at the unit's TOC and how S2 functions drive other TOC functions.
_____	Submit REDTRAIN requests through applicable higher S2 to G2 training, as required.
_____	Review threat OB holdings and files. Order update material as required.
_____	Determine available intelligence databases and actually "work the system" to obtain data in support of a CONPLAN. Brief CDR on the results.
_____	Identify gaps of information in battle books, OB holdings and files, and intelligence annexes. Submit RIIs to satisfy intelligence requirements.
_____	Identify S2 and intelligence weaknesses from the last EXEVAL and present a correction plan to the CDR.
_____	Evaluate intelligence training classes and provide written results to the CDR.
_____	Evaluate unit soldier's knowledge of intelligence training tasks and provide a written report to the CDR.
_____	Determine if all ADP systems are accredited. Brief CDR on steps needed to correct any problems.

_____ Demonstrate a thorough understanding of the intelligence reporting system during FTXs.

_____ Act as threat CDR during the wargaming process and TF rehearsals.

_____ Develop an internal S2 section intelligence cross-training program. Have section soldiers teach the classes.

_____ Determine unit's security posture during FTXs and recommend corrective actions to the CDR.

_____ Become familiar with and teach a class on doctrine, tactics, and current vehicles of a CONPLAN threat.

PHASE IV - ADVANCE PHASE

This phase will take the S2 who has mastered the intelligence fundamentals through **the first year,** during which the unit will have participated in the full annual training program.

Initial/Date **Task**

_____ Successfully complete an EXEVAL.

_____ Successfully deploy section and perform S2 operations during a CTC rotation.

_____ Successfully deploy section and perform S2 operations during a BCTP Warfighter Exercise.

_____ Qualify or familiarize yourself on all unit weapon systems.

_____ Update unit's intelligence annex as required.

_____ Research a classified intelligence topic that is relevant to the unit's mission and brief the CDR on the conclusion.

_____ Accurately predict threat actions during FTXs using IPB and all intelligence assets.

_____ Successfully integrate with higher echelon G2/S2.

APPENDIX B

INTELLIGENCE PREPARATION OF THE BATTLEFIELD PRODUCTS

This following examples of various overlays, templates, and matrices are constructed and used during the IPB process to enhance the battlespace visualization of the commander and staff. These samplings are not all-inclusive. Your products will be dictated by your mission statement, resources available to you, and the time allowed.

Figures B-1 through B-6 are terrain overlays. Figures B-7 through B-13 are templates and associated matrices. Figure B-14 is a sample of an ADA-tailored IPB.

The MCOO includes—

- **MCs** and **AAs** stated in terms of concealment and cover, size and deployment type of formation that can move along them (armored battalion in company wedge), speed the formation can reasonably achieve; dismounted, mounted, and aerial routes; trails and passes that will allow column movement if unopposed.

- **Obstacles** in terms of what they are an obstacle to.

- **Key terrain**.

- **Restricted terrain** in terms of what size force can deploy there and what mobility work could be done to "unrestrict" it.

- **Severely restricted** terrain in terms of what will allow a dismounted force to traverse it and at what speed.

- **IVLs**. Without a 1- or 5-meter resolution terrain product, IVLs will have to be determined by historical knowledge or ground reconnaissance.

- **Soils** and **weather analysis** that indicate trafficability and "dig-ability."

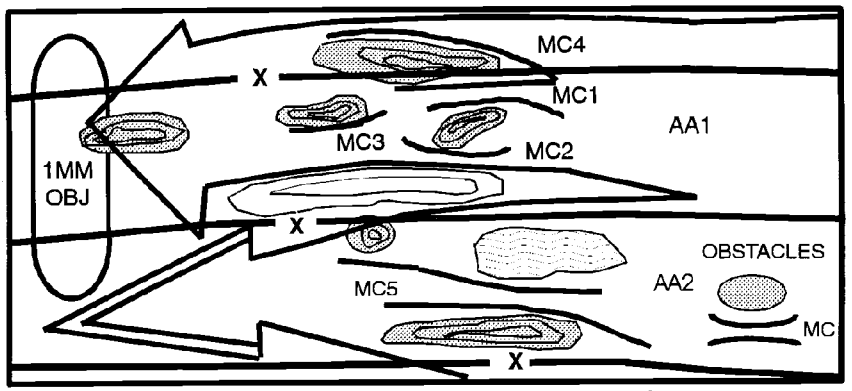

Figure B-1. Modified combined obstacles overlay.

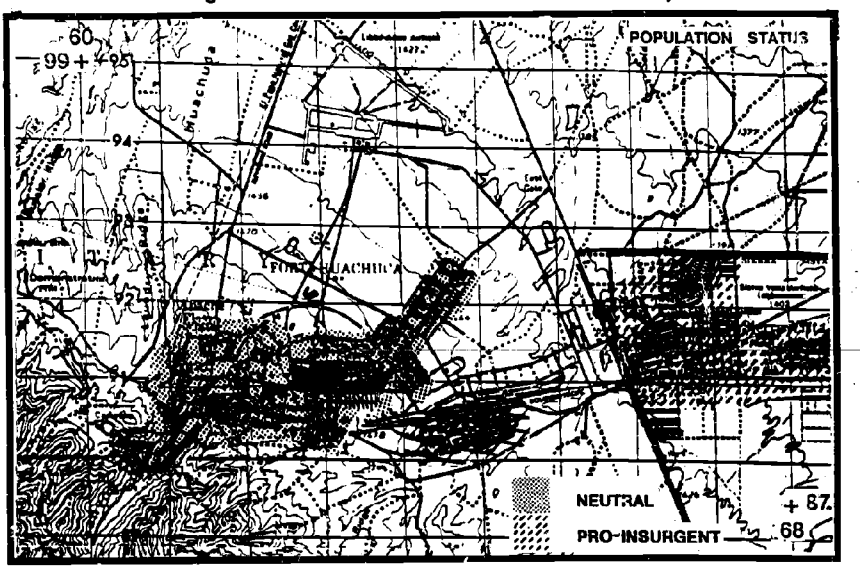

Figure B-2. Population status overlay.

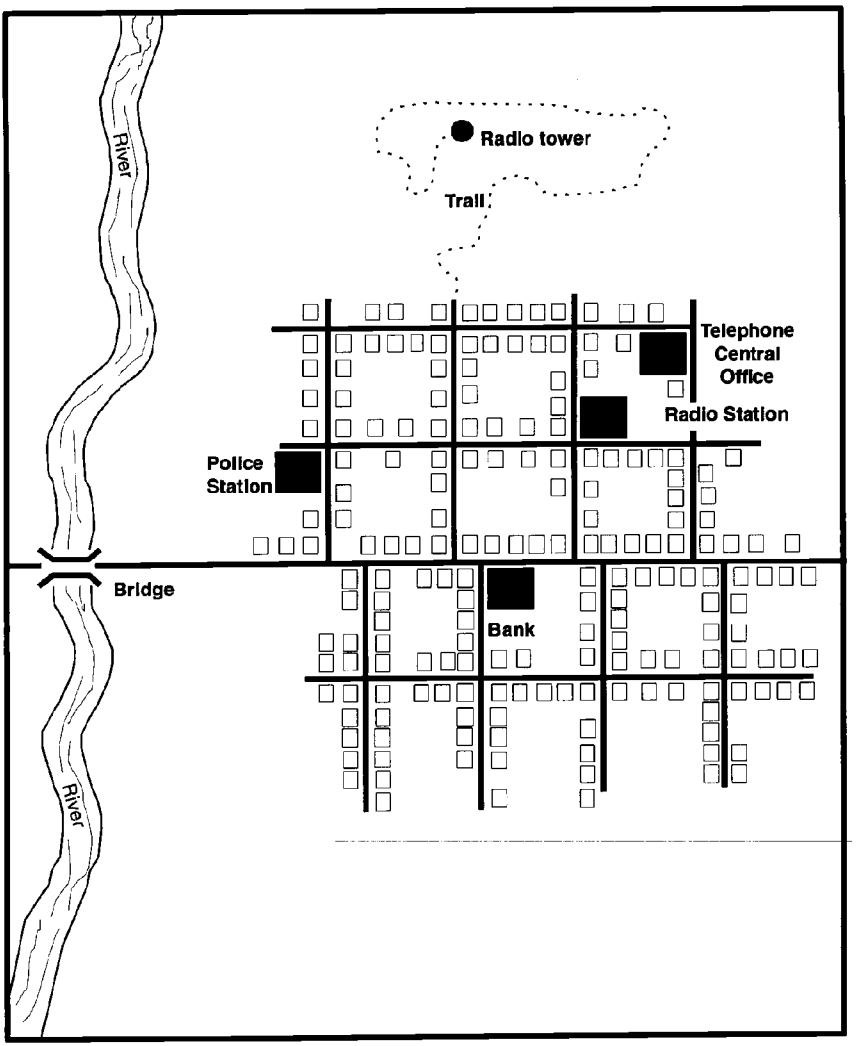

Figure B-3. Key facilities and target overlay.

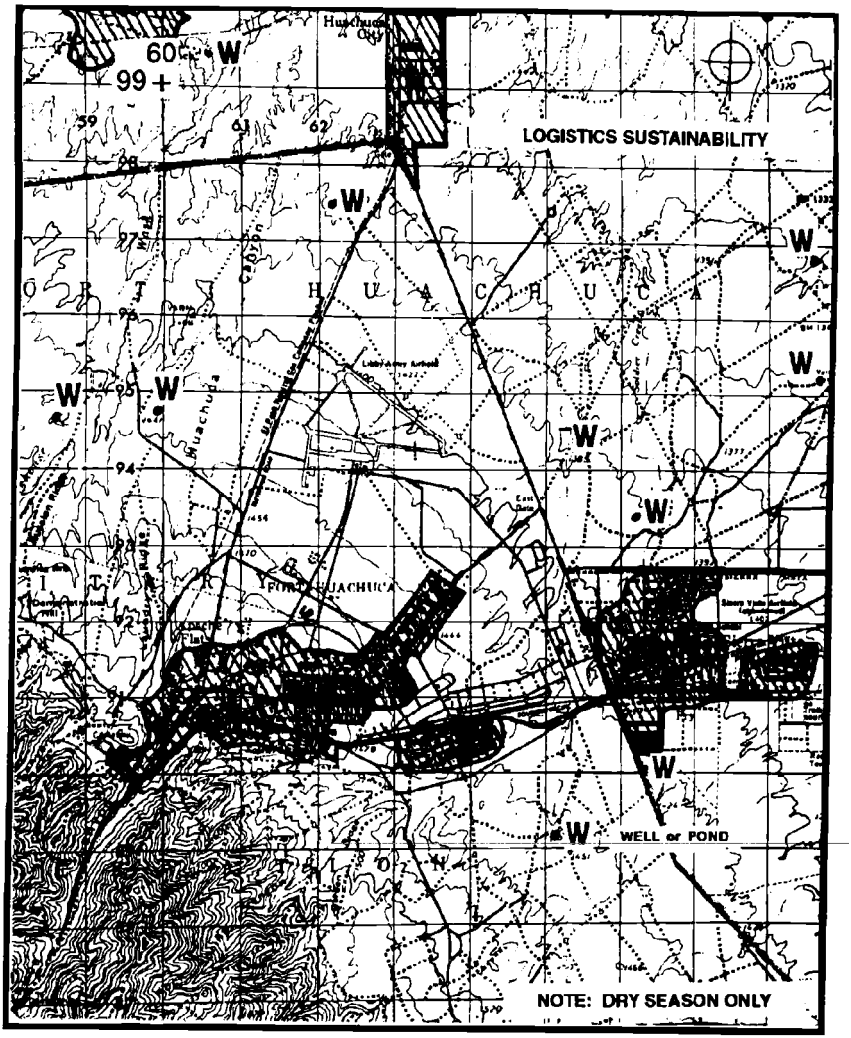

Figure B-4. Logistics sustainability overlay.

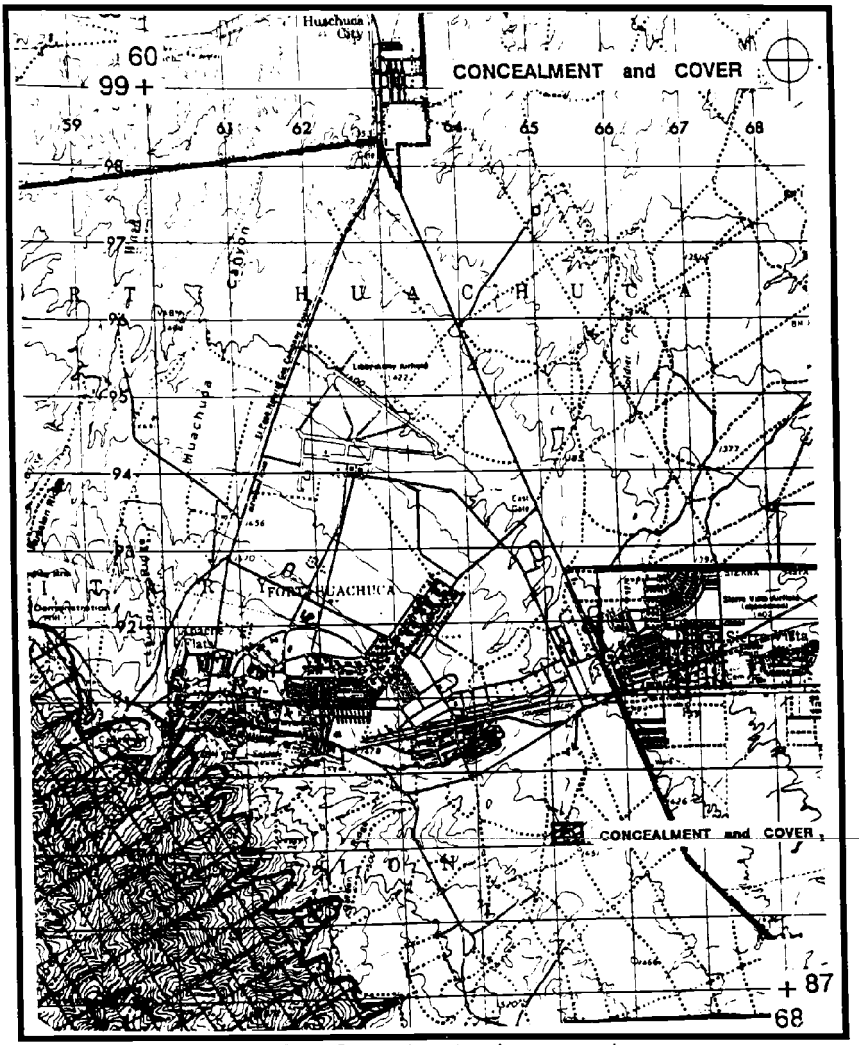

Figure B-5. Concealment and cover overlay.

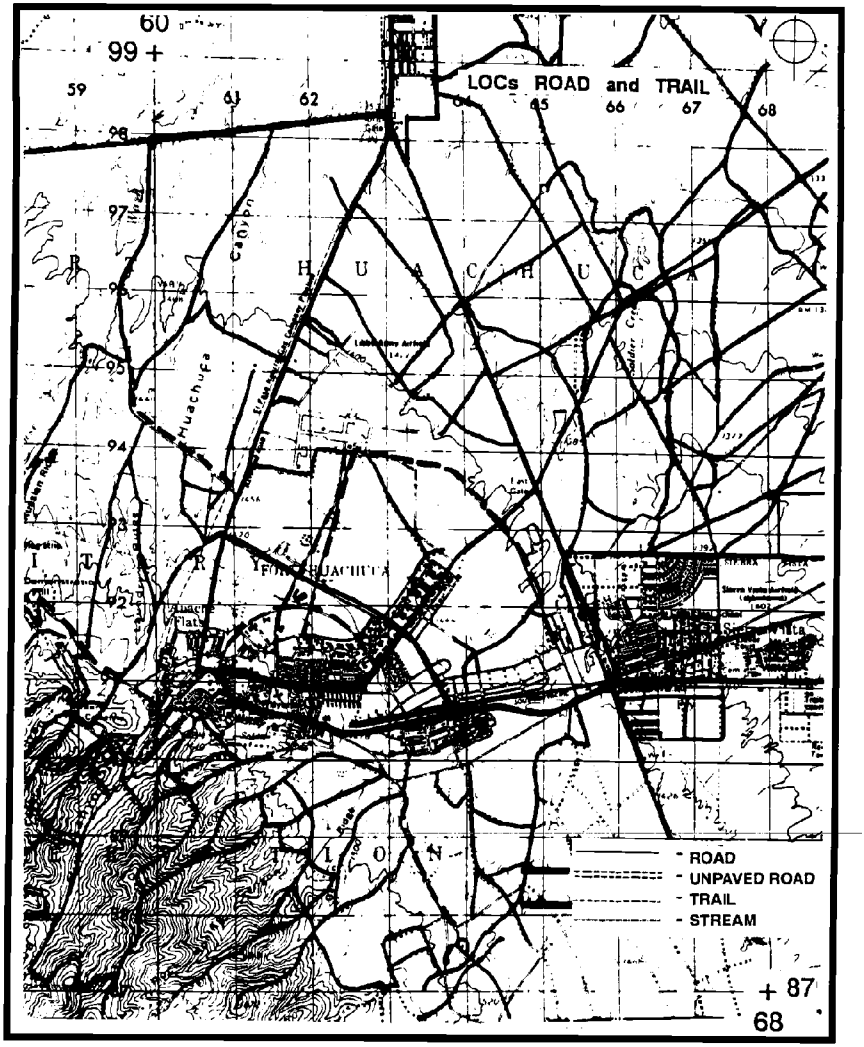

Figure B-6. Lines of communication overlay.

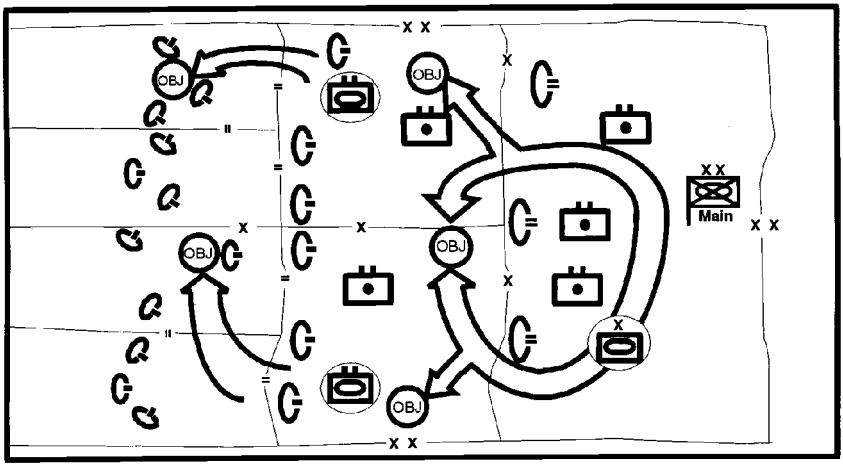

Figure B-7. Doctrinal template - depicts enemy forces according to doctrinal deployment, unconstrained by terrain.

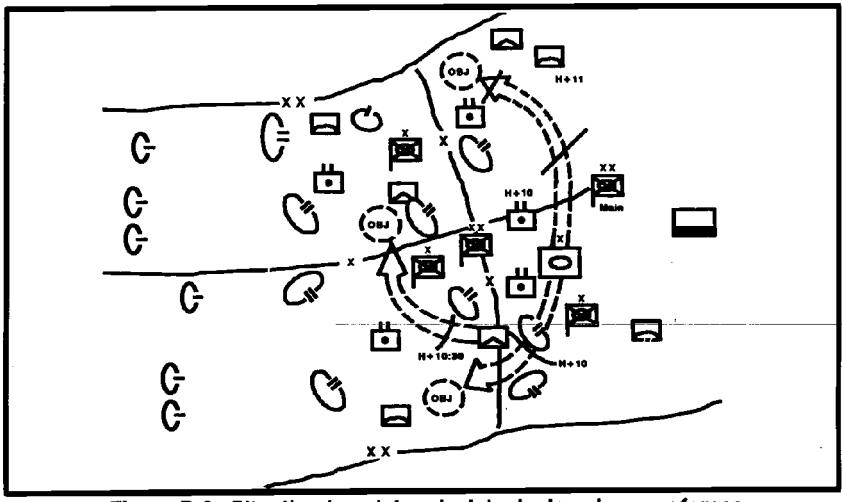

Figure B-8. Situation template - depicts deployed enemy forces adjusted for obstacles and terrain.

The situation template should include the following for mechanized armor-based offense and defense.

In the offense:	**In the defense:**
• Objectives & LOA. • AAs & MCs. • Recon routes, OP & IEW sites. • Firing lines & direct fire range fans. • Formations & deployment lines. • Artillery targets & range fans. • Artillery & ADA position areas. • ADA coverage. • Attack helicopter routes, BPs & range fans. • LZs. • CAS routes. • Situational obstacles. • Chemical agent targets. • Smoke targets	• BPs & direct fire range fans. • Reserve & hide positions. • CATK routes & firing lines. • Counter-SOPs & counterrecon forces. • Recon routes, OP & IEW sites. • Ambush sites. • Artillery targets & range fans. • Artillery & ADA position areas. • ADA coverage. • Attack helicopter routes, BPs & range fans. • Tactical & protective obstacles. • CAS routes. • Situational obstacles. • Chemical agent targets. • Smoke targets.

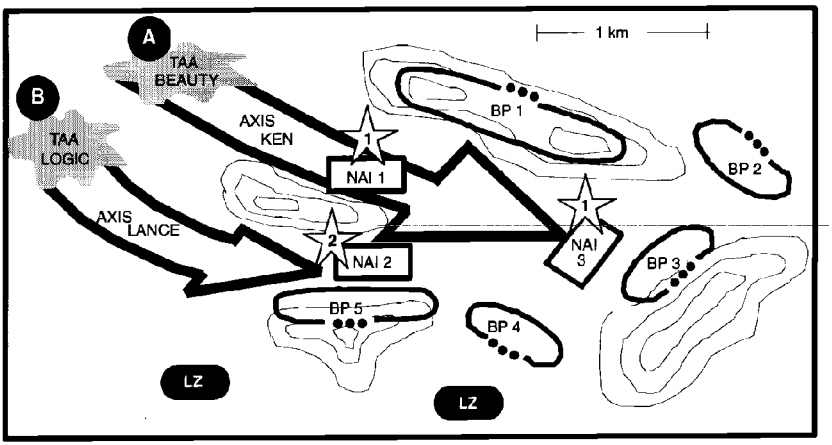

Figure B-9. Decision support template.

DP No.	1	2
Decision Criteria	Insurgent Camp is in NAI 1 or 3.	Insurgent Camp is in NAI 2.
Maneuver	A Co receives 3/B, occupy TAA BEAUTY, O/O movement to CATK along AXIS KEN.	A Co occupies TAA BEAUTY, O/O occupy BPs 1, 2, and 3.
FS	Priority: A, B, C.	Priority: C, B, A.
M-CM-S	1/A/13th Engr to A.	1/A/13th Engr to C.

Figure B-10. Partial BOS synchronization matrix.

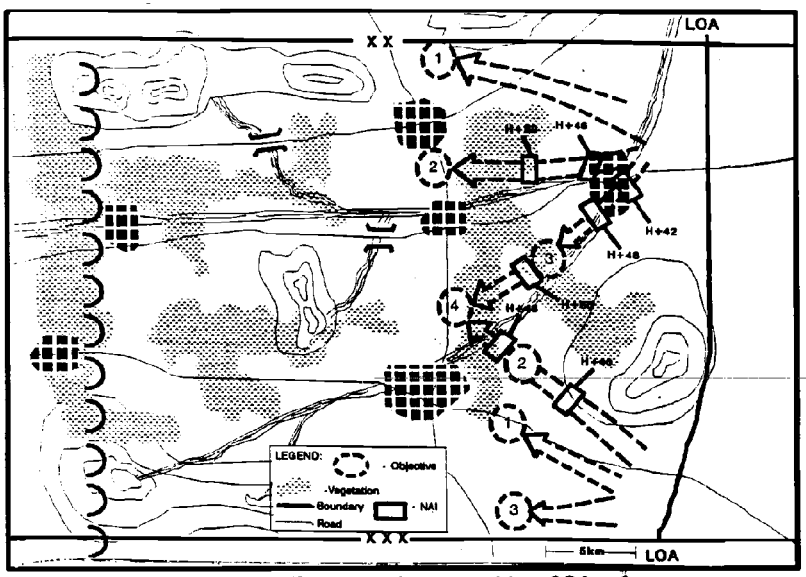

Figure B-11. Event template - considers COAs of reinforcing or counterattacking forces.

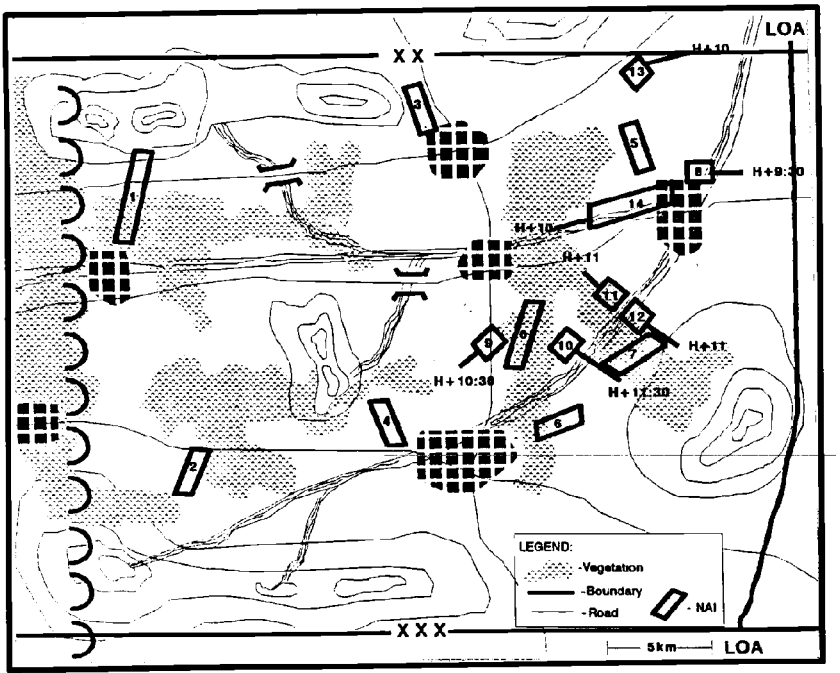

Figure B-12. Event template - depicts key events in each threat COA.

NAI	EST TIME	INDICATORS THAT WOULD HELP CONFIRM COA 1	COA 2	COA 3	OTHER
1	H-15		AASLT Forces		
2	H-15		AASLT Forces		
3	H-15	AASLT Forces		ASSLT Forces	
4	H-15		Infil of LT Inf		
5	H-4		LT Inf ATK NAI 5		
6	H-4	LT Inf ATK NAI 7	LT Inf ATK NAI 6		
7	H-4	LT Inf ATK NAI 8		LT Inf ATK NAI 7	
8	H-4	■Poised to ATK		LT Inf ATK NAI 8	
9	H-4	■Poised to ATK	■Poised to ATK		TD ATKs
10	H-4		■Poised to ATK	■Poised to ATK Abreast	TD ATKs
11	H-6			■Shifts N	
12	H-18				1 or 2 Bdes ATK N
13	H-18				1 or 2 Bdes ATK S
■ Indicates ECOAs.					

Figure B-13. Event matrix.

CONSIDERATIONS FOR AIR IPB

1. DEFINE THE BATTLEFIELD .

- AI for air IPB is significantly larger than ground IPB.
  - – Includes airfields which can range supported unit AO to include those within aerial refueling radius.
  - – AAAs which lead into supported unit's AO.
  - – Three types of air avenues:
    - * F/W Attack = Normally follows ground forces.
    - * F/W Transport = Bombers and R/W lift uses terrain to mask ingress and egress routes.
    - * R/W Attack = Normally follows ground forces.

2. DESCRIBE THE BATTLEFIELD'S EFFECTS . See the following example of weather effects on aviation operations.

TYPE AIR-CRAFT	MINIMUM VIS	WIND-SPEED & DIREC-TION[1]	PRECIPI-TATION	TEMPER-ATURE & HUMIDITY[2]	ILLUMI-NATION
Fixed Wing	2.5 nmi vis 2.5 nmi AGL ceiling in hilly terrain 1.0 nmi AGL in flat terrain	For airborne operations speed must be <13 knots	Severe weather within 3 miles of target will hinder acquisition. Freezing rain greatly limits lift capability	Temp >100 and humidity <80% will degrade payload capability	Little air-to-air or point CAS capability at night except newest F/W
Rotary Wing	1.0 nmi vis 300 ft AGL	For airmobile operations speed must be <13 knots	Same	Same	No CAS without illumina-tion except newest R/W

[1] Strong winds perpendicular to AAA increase difficulty in hitting target.
[2] Amount of degradation differs with type of aircraft.

Figure B-14. Sample of an ADA-tailored IPB.

- Terrain Analysis.
  - Determine impact of geographic factors on the ability of the aircraft to approach, acquire, and engage a target.
  - Predict how an aircraft would most likely approach target or area to deliver ordnance.
  - Locate positions that rotary wing could use for stand-off and/or pop-up attacks.
  - Determine locations of possible LZs, DZs, and the AAAs to these areas.
  - AAAs do not stop at FLOT or FEBA and they do not enter your AO solely from the FLOT or FEBA; watch your flanks and rear.
  - The closer an aircraft is to a target the greater an influence terrain will have on the aircraft and how it is employed.
  - The best method for formulating AAAs is based on fixed factors:
    * Locations of enemy airbase or staging area (known or suspected).
    * Position of friendly targets.
    * Most aircraft will fly a straight-in approach from the airbase to the vicinity of the target.

    Reason: Shorter overall mission time, less fuel needed, more payload or ordnance.
  - Exceptions which cause deviation from this rule:
    * Heavy concentrations of air defense.
    * Major terrain features that can mask the approach of aircraft at low altitudes.
    * Terrain that may force unnecessary exposure.
    * Terrain exceeding the operating ceiling of rotary-wing aircraft.
  - What happens in the vicinity of the target?
    * Most attacking aircraft will drop lower to use terrain masking and minimize early warning and exposure times to associated air defenses.
    * How will the enemy aircraft approach the target (Hi-Hi-Lo, Lo-Hi-Lo, or Lo-Lo-Hi, etc)?
    * To engage the target the pilot must be able to see it (visual, radar, sensor).
    * The pilot must approach his target so he can see it at far enough distance to allow lock-on and engagement by his weapon system.
    * The pilot will maximize his standoff range to increase survivability.
  - How to determine the direction of attack:
    * Know the enemy HPT; what friendly asset he must destroy.
    * Know the location of these assets.
    * Know the location of known or suspected enemy airbases and FARP.

Figure B-14. Sample of an ADA-tailored IPB (continued).

* Determine AAA which could be used by fixed- or rotary-wing aircraft making the attack.
* Determine locations from which stand-off and pop-up rotary-wing attacks are most likely.
* These locations will provide terrain masking for the aircraft to hide behind.
* The location must also provide observation and fields of fire into the target area when the aircraft pops-up.
* This type of location + a masked ingress and egress route = a stand-off or pop-up position.
* Within the vicinity of the target, consider the following:
  _ LOS acquisition of the target.
  – Weapon stand-off capability.
  – Pilot reaction time.
  – Aircraft survivability.
  – Standard tactics.

3. EVALUATE THE THREAT.

- Should address the following:
  – AOB—How many and what type aircraft. (Include different models such as Mi-24 E or F because they all have varying payloads, optics, and weapon systems.)
  – Capabilities of the aircraft in the enemy inventory.
  – Types of ordnance available to the enemy.
    * Guns.
    * Rockets.
    * Tactical ASMs, CBUs, PGM, AAM, NBC, and mines.
  – Capabilities:
    * Range.
    * Guidance (aerial, ground).
    * Release altitude.
  – Doctrine:
    * Raid sizes and composition.
    * Ingress and egress altitude and speed.
    * Delivery profiles.
    * Use of EP and SEAD.
  – C^2:
    * Most non-Western aircraft operate under strict ground control. They are vectored toward a target rather than being sent to an area to seek

Figure B-14. Sample of an ADA-tailored IPB (continued).

targets on their own. The vector is from ground emplaced beacons which normally operate in HF range.
- – Work to template high value C^2 targets:
  - * GCI nodes.
  - * FAC.
  - * RNP.
  - * Beacons.
- – Maintenance and Sortie Generation Capability:
  - * OR rates determine the percentage of aircraft able to fly. OR rate x number of aircraft = the maximum aircraft that can fly at any one time.
  - * The average sortie generation rate for most modern air forces is 2.5 to 3 for first 24-hour period. Second and succeeding day's planning factor is 5% of available number of aircraft.
  - * To get sortie generation rate: number of aircraft x sortie generation rate = number of sorties in a 24-hour period.
  - * To estimate number of sorties in your AO, consider ground situation, enemy main effort, enemy doctrine.

4. DETERMINE THREAT COURSES OF ACTION.

- Enemy air operations are conducted in support of their ground operations. The most important part of determining enemy air COAs is to understand the ground situation and enemy ground COAs.

- With the information and analysis you've done in the first three steps, determine how the enemy will employ his air assets.

- Consider enemy doctrine, AAAs, terrain in the target area, and current weather conditions.

- You must answer the following questions:
  - – When will the enemy commit his air assets?
  - – Where will the enemy commit his air assets (target area)?
  - – What air assets will the enemy commit (number of aircraft)?
  - – How will the aircraft attack in the target area (AAA or delivery profile)?

Figure B-14. Sample of an ADA-tailored IPB (continued).

APPENDIX C

RECONNAISSANCE AND SURVEILLANCE PLANNING

R&S planning is continuous. You must understand the commander's intent for each mission. After mission analysis, the commander should tell you the key information needed before and during the mission. This key information is the commander's PIR and IR. The PIR and IR provide the initial focus to R&S planning. Plan to conduct R&S throughout the depth of the battle in space and time. (See FM 34-2-1.)

G2/S2 R&S RESPONSIBILITIES (Table C-1)

Table C-1. G2/S2 R&S responsibilities.

REQUIREMENT	EFFECTS
Coordinate with higher, flank, forward units.	Better guidance from higher & integration with adjacent units; less redundancy & gaps in coverage.
Identify R&S requirements; rehearse R&S plan.	Success of unit mission.
Supervise & coordinate the command's aerial & ground reconnaissance (include LRRPs).	Better use of survl systems (GSR/REMBASS employment), LRRPs, and tasking UAVs or other aerial assets to answer CDR's PIR.
Brief GSR, REMBASS, and patrol team leaders (plt leaders of every BOS in AO to collect) (e.g., LLVI, LRSD, scouts).	Effectiveness of R&S assets which, in turn, affects success of R&S effort.
Prepare R&S WARNO and OPORD early-on.	Start the reconnaissance effort ASAP.
Update R&S OPORD as info is received.	Effectiveness of R&S effort and unit mission.
Provide R&S plan to higher, lower, and adjacent units.	R&S effectiveness and other unit actions; prevention of negative effects.

EXAMPLE: The primary R&S planning objective is to task subordinate units (all possible assets; e.g., MI, MP, FA, Signal, Engr, FSB) to cover NAIs important to brigade mission or directed by higher HQ. Subordinate units plan the use of available R&S assets to satisfy taskings from the brigade and their own requirements. They strive to complete their plans quickly (using the 1/3, 2/3 rule) so R&S assets have time to prepare and execute the plan. As soon as they are complete, the subordinate unit plans are consolidated at brigade to form the brigade R&S plan. You now have a draft plan that shows when and in what areas to begin R&S planning.

R&S PLANNING PROCESS (Figure C-1)

I. PLANNING PROCESS.

A. Initial Requirements:

1. Did higher HQ provide tasking requirements?
2. Was the commander's PIR and IR stated and included?
3. Did commander provide R&S intent?
4. Did S2 brief the staff on enemy collection capabilities?
5. Were other staff tasks performed?

B. SIR Developed (IPB Driven):

1. Did S2 identify air or ground AA?
2. Did situation and event templates reflect probable or prioritized ECOAs?
3. Was NAI developed in detail? (What is expected? When? Where?)
4. Were collectible indicators at NAIs developed?
5. Were SIR developed from NAIs and indicators?
6. Were reporting requirements developed for priority collection missions to allow the commander time to change plans?

C. Possible Collectors Analyzed:

1. Did S2 coordinate with staff, S2, and G2 to identify all available collection assets?
2. Did S2 analyze asset capabilities to develop collection requirements based on range to target, time available, target characteristics, terrain, weather, enemy (obscurant use), and communication?
3. Did S2 analyze collection redundancy (is it necessary)?

Figure C-1. R&S planning process.

4. Did staff identify support requirements (communication nets, retransmission, FS, NBC reconnaissance support, logistic support, special equipment support)?
5. Did S2 identify gaps in collection?
6. Did S2 back brief S3 or the commander on R&S concept?
7. Were WARNOs sent to appropriate assets?
8. What were timelines?
   a. When was mission received?
   b. What is NLT time for execution?
   c. When was templating done?
   d. When was tentative plan made? Back briefed?
   f. When was initial reporting needed?
   g. Who was in charge of R&D planning?
   h. Who was in charge of counterreconnaissance planning?
   i. What is LTIOV.

II. PREPARATION FOR R&S OPERATIONS.

A. Specific Collection Instructions:

1. What assets could be available? Used? **(See Figure C-4.)**
   a. Scouts.
   b. Patrols.
   c. Forward Observers.
   d. Armor.
   e. Aviation.
   f. Infantry.
   g. EW.
   h. REMBASS.
   i. Chemical.
   j. UAV.
   k. Medical.
   l. CI teams.
   m. GSR.
   n. OPs and LPs.
   o. Signal.
   p. Antitank.
   q. Engineer.
   r. Cavalry.
   s. MP.
   t. ADA.
   u. SOF.
   v. Support units.
   w. GRCS.
   x. Interrogation teams.

2. Did the S2 provide detailed instructions to tasked assets? Did the instructions include—
   a. Who is tasked?
   b. What to look for?
   c. Why to look?
   d. When to look?
   e. Where to look?
   f. What you could expect to see?
   g. How to get there?
   h. Who to coordinate with?

Figure C-1. R&S planning process (continued).

i. Passage of lines and recognition signals?
j. Reporting requirements?
k. Friendly assets in AO?
l. Resupply?
m. Obstacles?
n. MEDEVAC?
o. NBC hazards?

3. Was the collection location appropriate (concealment, collectable)?
4. Were there sufficient control measures included to control assets during mission?
5. Did the S2 request assistance from higher HQ for identified collection gaps?
6. Did the R&S plan cover all collection requirements?
7. Were assets overtasked?
8. Was redundancy appropriate for this mission?

B. Coordination:

1. What is format of plan (collection plan, overlay, matrix)?
2. Were direct or indirect fires or jamming coordinated between staff and S2?
3. Was a CI vulnerability assessment made?
4. Was additional equipment (special) planned for?
5. Were communication nets established to meet reporting needs?
6. Were commanders and staff briefed on plan before execution?
7. Did commander or S3 approve final plan?
8. Did assets know specific requirements (PIR and IR)?
9. Was plan disseminated to all involved or with a need to know (FRAGO, overlay)?
10. Was plan sent to higher HQ?

C. Asset Internal Coordination:

1. Was equipment checked?
2. Were internal procedures clarified?
3. Did coordination between assets occur?
4. Was mission rehearsed?
5. Was plan developed far enough in advance for assets to prepare or rehearse?
6. Was plan developed in time for higher HQ to review?

III. EXECUTION.

A. Continuity of R&S and counterreconnaissance operations:

Figure C-1. R&S planning process (continued).

1. Did unit plan provide for operations when scout or other R&S assets are inoperable?
2. Did unit SOP provide for operations during briefings, debriefings, or rehearsals?
3. Are unit and leaders cross-trained to facilitate substitutions or replacement of scouts?

B. Asset and Unit Response:

1. Did assets depart and set up on time?
2. Did assets use concealment, cover, and camouflage?
3. Were assets able to observe enemy undetected?
4. Was low-level deception used?
5. What were meteorological report requirements?
6. Were enemy locations pinpointed?
7. Was objective reconnoitered?
8. Were obstacles identified and marked?
9. Were routes marked?
10. Did assets submit route/obstacle overlay?
11. Was enemy reconnaissance located?
12. Were counterreconniassance missions performed?
13. Did assets help with C^2 during attack?
14. Did assets help direct or control fires?
15. Was terrain reconnoitered (trafficability reported)?

C. Reporting:

1. Were reports timely, accurate, and concise?
2. Were assets debriefed?

D. Results:

1. Did S2 plot asset reports (track results of plan)?
2. Did S2 identify inadequately tasked or unproductive assets and change tasking (with approval of commander and S3)?
3. Did reports or analysis answer PIR and IR?
4. Was R&S plan updated and recoordinated?
5. Were templates updated?

E. Dissemination:

1. Was commander briefed on answer to PIR?
2. Has commander updated PIR?
3. Did units get intelligence based on priority?
4. Did higher HQ get answers to taskings?
5. Did assets receive feedback on level of success?

Figure C-1. R&S planning process (continued).

OTHER R&S PLANNING CONSIDERATIONS (Figure C-2)

1. General.
   a. Combat information is knowledge of the enemy, weather, and terrain.
   b. R&S collection should answer the commander's PIR and IR.
   c. Every soldier is an important HUMINT collection asset.

2. Analysis of information collected on PIR and IR is an objective process.

3. Determine requirements:
   a. Set priorities. Develop SIR and SOR. Do not let the R&S elements decide what answers the commander's PIR.
   b. Terrain and weather.
   c. Tactical situation (deep, close, rear).
   d. Focus the R&S mission.

4. Develop R&S plan based on the principles of reconnaissance:
   a. Timely information.
   b. Aggressive reconnaissance.
   c. Continuous reconnaissance.
   d. Focus combat power.
   e. Relevant information (focused on PIR and CCIR).
   f. Reconnaissance OPSEC. Coordinate with G3/S3 to establish control measures which deconflict and help protect R&S assets on the battlefield.
   g. Accurate information.
   h. Complementary with operations.
   i. Consideration of threat counterreconnaissance threat.
   j. Destruction of threat reconnaissance elements when detected.
   k. Plan for CasEvac, resupply, and reconstitution for teams in the field.

5. Identify METT-T.

6. Develop communications plan and reporting schedule.

7. Issue WARNO to R&S asset leaders.

8. Coordinate R&S plan with—
   a. Commander and commanders of areas in which teams will operate.
   b. Adjacent and higher G2/S2.

Figure C-2. R&S planning considerations.

c. Unit S1/S3/S4.
d. FSO.
e. SIGO.
f. Engineer LNO.
g. ADA LNO.
h. Chemical Officer.
i. G3/S3 to tie R&S plan into the maneuver plan.

9. Brief R&S team leaders and all other R&S assets.

10. Advise higher and lower S2 of R&S plan.

11. Request support from higher headquarters.

12. Write R&S tasks into paragraph 3 of the OPORD.

13. Evaluate reports, review requirements, and identify intelligence gaps.

14. Analyze reports to deny or confirm your templates; then update templates.

15. Ensure combat information is passed immediately to those elements that can react to it.

16. Update the R&S plan based on known intelligence.

17. Plan for future operations.

18. Maximize use of all available assets.

Figure C-2. R&S planning considerations (continued).

You can now begin adding some detail to the R&S plan. Integrate any requirements from higher HQ. Translate the initial PIR and IR into indicators on which R&S assets can collect. Use the indicators to develop the SIR and SOR. The SIR and SOR ensure assets are collecting specific information that answers the PIR and IR.

Once you have a picture of the coverage required for the R&S effort, prioritize the SIR. Assign a high priority to those SIR that, when answered, will provide the greatest amount of intelligence in the shortest amount of time. After you prioritize the SIR, draft the R&S plan and distribute to the appropriate R&S assets. It is critical that you deploy R&S assets early-on and update them as additional information is received.

TOOLS TO TRACK DEPLOYED R&S ASSETS

Three methods are used to track deployed R&S assets:

- Reconnaissance base OPORD (Figure C-3).
- R&S overlay (Figure C-4).
- R&S tasking matrix (Figure C-5).

Select any method as long as the assets receive clear, specific instructions. Some S2s use all three methods by attaching the R&S overlay and R&S tasking matrix to the reconnaissance order prior to dissemination. When possible, using all three is best because each asset then has a graphic, a matrix, and a written set of instructions.

RECONNAISSANCE ORDER:

The reconnaissance order is the narrative instructions for deployed assets. Figure C-3 is an example of a brigade reconnaissance order.

RECONNAISSANCE ORDER

1. SITUATION.
   a. Enemy forces.
   b. Friendly forces.
   c. Attachments and detachments.
   d. Assumptions (OPLAN only).

2. MISSION. Expressed as task and purpose derived from planning process. Clearly stated reconnaissance objectives.

3. EXECUTION. Commander's intent, derived during planning process:

a. Concept of Operation. State how reconnaissance assets are operating in relation to the parent organization. This scheme must identify if the reconnaissance force is infiltrating or penetrating the enemy's security forces (or both) and how this will occur.

Figure C-3. Example of a brigade reconnaissance OPORD.

(1) Manuever.
(2) FS. (Refer to FS annex if required.)
(a) Scheme of fires that specifies what fires are available and how to get them.
(b) Engagement criteria.
(c) Scheduled fires in support of insertions and extractions.
(3) Mobility and survivability.
(4) Air defense.
(5) C^2W.

b. Tasks to maneuver units. [List all units from task organization into subparagraphs, and only unique items for those units; all other tasks go into d below.] For each of the elements in the reconnaissance force, state the following:
(1) How to get there.
(2) Where to look (NAI for static targets).
(3) What to look for.
(4) When to look for it.
(5) Plan to maintain contact with moving target.
(6) What equipment to bring.
(7) How (what communications systems, how often) to report.
(8) To whom to report:
(a) Brigade reconnaissance teams.
(b) Task forces.
(c) MI company (EW, UAV, other).
(d) ADA battery.
(e) Engineer battalion.
(f) FA battalion.
(g) Chemical company.
(h) MP platoon.
(i) Signal company.
(j) FSB.

c. Tasks to combat support units (if applicable).
(1) Fires (or refer to FS annex).
(a) Air support.
(b) Chemical support.
(c) FA support.
(2) Mobility and survivability. (Refer to mobility and survivability annex if required.)

Figure C-3. Example of a brigade reconnaissance OPORD (continued).

(3) Air defense. (Refer to air defense annex if required.)
(4) C^2W. (Refer to C^2W annex if required; address applicable subcomponents of C^2W: deception, EW, psychological warfare, UAVs.)

d. Coordinating instructions.
(1) Time or condition when OPORD or OPLAN becomes effective.
(2) EEFI.
(a) PIR.
(b) EEFI.
(c) FFIR.
(3) Risk reduction control measures.
(4) Environmental considerations.
(5) Any additional coordinating instructions.
(a) LD or defend NLT _____ .
(b) MOPP level.
(c) Rally points, alternate positions.
(d) Rehearsal time, type, location.
(e) Extraction plan.
(f) PZ and LZ.
(g) Fratricide avoidance measures.
(h) ROE and actions on contact.
(i) IHL.

4. SERVICE SUPPORT. State the concept of logistic support.
a. Support concept.
b. Material and services (resupply location or time and days of supply, emergency resupply, vehicle evacuation).
c. Medical evacuation (CasEvac plan).
d. Personnel (reconstitution plan).
e. Civil-military cooperation. NA.
f. Miscellaneous.

5. COMMAND AND SIGNAL.
a. Command (C^2 structure, report plan).
b. Signal (nets used, retransmission or relay plan).

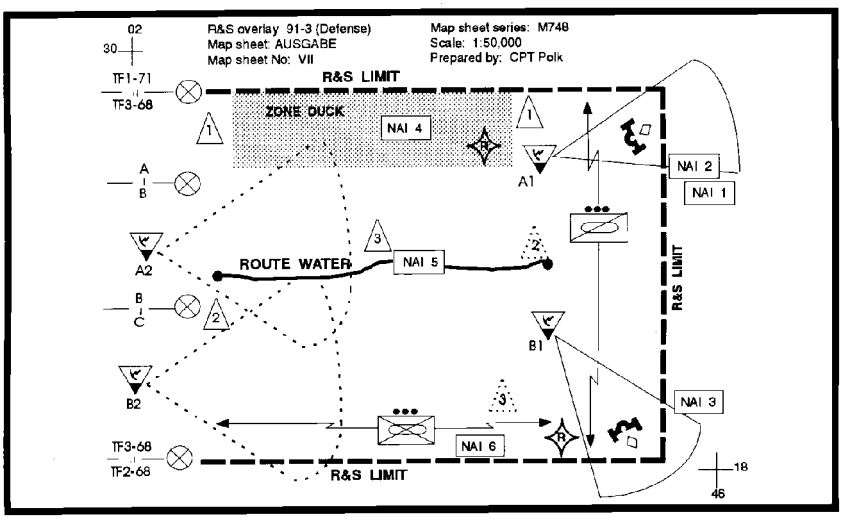
Figure C-3. Example of a brigade reconnaissance OPORD (continued) .

R&S OVERLAY:

The R&S overlay is the R&S plan in graphic format. Its purpose is to show exactly where and when R&S assets are operating. Use FM 101-5-1 for overlay graphics and symbols. Due to various R&S operational techniques and the unique nature of some SASO missions, you will need to construct some new graphics and explain them in your legend (Figure C-4).

The R&S overlay has two parts: (1) The graphic display of deployed or planned deployment of R&S assets, and (2) The marginal data consisting of the legend, administrative data, specific instructions to each asset, and the distribution list. The latter part consists of standard wording found on all overlays. (See top of Figure C-4.)

With digitized systems coming online, the location, heading, range to target, system health, and logistical data will be available NRT in digital, preformatted report format available to the S2/S3/S4 in the TOC, TAC, and ALOC.



INSTRUCTIONS:

SCOUTS: Establish forward screen NLT 1600 at coordinate_____. Target enemy recon (BRDM, BMP, tanks). Coordinate with B Co for route to screen position and GSR team.

REMBASS: Establish two strings vicinity____and____ NLT 1800. Target enemy dismount recon and MR troops infiltrating along forest trails. Coordinate passage with B Co, Scout platoon, and GSR team.

GSR: Establish position A1 vicinity____NLT 1700. Target enemy recon (BDRM, BMP, tanks, dismounted troops). Coordinate with A Co for passage, Scout platoon, and REMBASS team. Establish position A2 on order. Coordinate with B Co for position. Establish position B1 vicinity____ NLT 1700. Target enemy recon. Coordinate with B Co for passage, Scout platoon, and REMBASS team. Establish position B2 on order. Coordinate with C Co for position.

PATROLS: A Co conduct recon and security patrols in Zone Duck. Begin patrols NLT 1830 to 0600. Target enemy dismounted troops, BMP, and BRDMs. Coordinate with GSR team and Scout platoon. C Co establish screen along southern flank NLT 1800. Target enemy recon, BMP, BRDM, tanks. Coordinate with Scout platoon and GSR team.

OP/LP: Position as per battalion R&S SOP.

REPORTS: Report on battalion intelligence net using SALUTE format. Patrol leaders report on intelligence net after each patrol. Report combat information on intelligence or operations net. Assets report using schedule in R&S SOP. React to jamming as per battalion TAC SOP.

DISTRIBUTION: A, B, and C Companies, Scout platoon, GSR team, REMBASS team, S3, FSO, and brigade S2.

Figure C-4. R&S overlay with instructions on acetate.

The key portion of the administrative data contains the written instructions to each R&S asset. The instructions should focus on—

- The required operational timeframes. Give each asset a start and a finish time for each observation or action.

- The target. To answer the PIR, look for specific indicators. Each asset should be told exactly what to look for. Never give broad-based generic mission statements. Specific guidance will promote specific answers.

- Coordinating instructions. All assets at one time or another will move through or near another unit's AO. To keep units from shooting (directly or indirectly) friendly R&S assets, assets and units must coordinate with each other. FSO should restrict fires around R&S assets.

- Reporting requirements. All assets should know when, how often, and what format to use when reporting. Provide frequencies, alternate frequencies, and reactions during jamming, as well as the LTIOV for specific information to be reported.

Initially, the locations for assets are areas in which you recommend that they deploy. After the assets have deployed to the NAI, they report to the S2 or the S3 the actual coordinates from which they can best accomplish their mission. The S2 or the S3 then updates the R&S overlay graphics to show actual locations. Include the following control measures on your R&S overlay:

- Friendly boundaries, R&S limit of responsibility, NAIs, SPs, RPs, and checkpoints.

- Graphics depicting route, area, and zone reconnaissance.

- Primary, alternate, and supplementary positions.

- Sectors of scan for sensors.

R&S TASKING MATRIX:

Another less preferred method of disseminating R&S guidance is the matrix method (Figure C-5).

- **Priority.** The priority number of each mission, which should correspond with the PIR number.
- **NAI.** The NAI number and grid coordinate.
- **START/STOP.** The times for this mission.
- **SIR INSTRUCTIONS.** Explains to the assets exactly what they are looking for (target).
- **TASKINGS.** Lists the actual assets tasked to conduct each mission. An "X" placed under each asset identifies the tasking.
- **COORDINATION.** Tells the assets which units to coordinate with for this mission.
- **REPORTS.** Provides the assets with reporting requirements.

(Classification)

DTG: _____

MISSION: _____

A	B	C	D	E	F	G	H	I	J	K	L	M	N	O	P	Q

Figure C-5. R&S tasking matrix.

BRIEFING OPORDs

The following OPORDs are additions to the base reconnaissance OPORD (see Figure C-3). GSR, REMBASS, and patrol employment OPORDs would be issued to the teams by the respective platoon leaders.

GSR EMPLOYMENT:

- Give GSR teams adequate time to prepare and deploy.
- Deploy GSRs for best area coverage.
- Deploy GSRs, with a security force, so they scan an area and provide early warning.
- Plan logistical support.
- Limitations:
  - — Limited to LOS acquisition and gives off detectable signal.
  - — Visibility hindered by heavy precipitation, thick vegetation, and broken terrain.
  - — Limited range and ability to identify except by personnel and wheeled or tracked vehicles.

- Brief team leader using the OPORD format at Figure C-6.

1. SITUATION.

   a. Enemy. Intelligence estimate format.

   b. Friendly.
      (1) Current unit locations.
      (2) Scheme of maneuver.
      (3) Boundaries.
      (4) Objectives.

2. MISSION. Who, what, where, when, and why for this R&S mission. Surveillance of threat antiaircraft from location and time.

3. EXECUTION.

   a. Concept of operation.
      (1) Primary and alternate routes to sites (SPs, PPs, checkpoints, RPs).
      (2) Primary, alternate, and supplementary sites.
      (3) Sectors of scan.
      (4) Operating times.

   b. Coordinating instructions.
      (1) Battalion and brigade R&S plan: patrols, scout routes, times, sizes, LP and OP locations, ground and air cavalry screens, REMBASS, asset replacement plan, NAI redundancy coverage backup plan, etc.
      (2) Link-up plan with security forces.
      (3) Obtain target list from FSO (recommend additional targets).
      (4) Coordinate fire control measures with FSO and plan NFA for team locations.
      (5) Obtain obstacle plan from TF engineer and check routes for obstacles.
      (6) Coordinate with supported commander to tie the R&S site into unit defensive plan or scheme of maneuver.
      (7) Review engagement and disengagement criteria.
      (8) Review actions upon mission completion.

Figure C-6. Example of a GSR OPORD.

4. SERVICE SUPPORT. Coordinate with S4, battalion maintenance officer, SIGO for—

a. Class I (Food).
b. Class III (Fuel).
c. Class IV (Barrier materials) (during prepared defense).
d. Class V (Ammunition).
e. Class IX (Repair parts).
f. Organizational maintenance.

5. COMMAND AND SIGNAL.

a. Signal.
(1) Issue SOI extract.
(2) Review reporting requirements and communications connectivity.
(3) Identify multiple reporting paths and methods.
(4) Review communications check requirements.
(5) Execute COMMEX prior to employment.
(6) Review actions upon EA.

b. Command.
(1) Review chain of command.
(2) Review leaders' locations.

6. SAFETY.

Figure C-6. Example of a GSR OPORD (continued).

IREMBASS EMPLOYMENT:

Brief team leader using the reconnaissance OPORD format (see Figure C-3) with the changes shown in Figure C-7.

1. SITUATION.

2. MISSION. Who, what, where, when, and why for this R&S mission. Monitor NAIs, DPs, routes.

3. EXECUTION.

a. Concept of operation.
   (1) SIR required.
   (2) Team leader recommends sensor mix, emplacement sites, and relay sites.
   (3) Primary and alternate routes and transportation to emplacement sites, PPs, and checkpoints.
   (4) Emplacement method.

b. Coordinating instructions.
   (1) Battalion and brigade R&S plan: patrols, scout routes, times, sizes, LP and OP locations, ground and air cavalry screens, IREMBASS.
   (2) Link-up plan with security forces.
   (3) Obtain target list from FSO (recommend additional targets).
   (4) Coordinate fire control measures with FSO.
   (5) Obtain obstacle plan from TF engineer and check routes for obstacles.
   (6) Review engagement and disengagement criteria.
   (7) Actions upon mission completion.

Figure C-7. Sample IREMBASS employment OPORD.

PATROL EMPLOYMENT:

Brief patrol leader using reconnaissance OPORD format (see Figure C-3) with the changes shown in Figure C-8.

1. SITUATION.

2. MISSION.

3. EXECUTION.

   a. Concept of operation.
      (1) Maneuver.
      (2) Fire support.

   b. Subunit tasks.

   c. Coordinating instructions.
      (1) Actions at the objective.
      (2) Time of departure and return.
      (3) Movement techniques and order of movement.
      (4) Routes.
      (5) PPs.
      (6) RPs and actions at RPs.
      (7) Actions upon enemy contact.
      (8) Actions at danger areas.
      (9) Actions at halts.
      (10) Locations of friendly obstacles, mine fields.
      (11) Rehearsals and inspections.
      (12) Debriefings.
      (13) SIR.

Figure C-8. Sample patrol employment OPORD.

DEBRIEFING Debrief patrols using the sample debriefing format below.

1. Size and composition of team. Team leader, assistant team leader, radio operator, and observers.

2. Mission.

3. SIR.

4. Reporting requirements.

5. Time of departure, method of infiltration, and point of departure.

6. Enemy observed enroute.
   a. Ground activity.
   b. Air activity.
   c. Miscellaneous activity.

7. Routes.
   a. Dismounted.
   b. Vehicle.
   c. Air.

8. Terrain.
   a. Key terrain.
   b. Significant terrain.
   c. Decisive terrain.
   d. Terrain compartment.
   e. Terrain corridor.
   f. Map corrections.

9. Enemy forces and installations.

10. Miscellaneous information.
    a. Lack of animals or strange animal behavior. Did animal reaction to patrol's presence generate alarm? If so, when, where, type of animal, activity that caused the alarm, and nature of alarm.

Figure C-9. Sample debrief format.

b. Mutilated plants.
c. Strange, uncommon insects.
d. Abandoned military equipment, number and type.
(1) Out of fuel.
(2) Unserviceable; estimate reason.
(3) Destroyed or damaged; how.
(4) Operational equipment left intact.

e. Abandoned towns or villages.

11. Results of encounters with enemy forces and local populace.

12. Condition of team including disposition of dead and wounded.

13. All of team's maps or any other identifiable material returned with team. For missing items, describe item and approximate location lost.

14. Conclusions and recommendations.

15. Process CEE, CEM, photographs, and videos taken by teams.

16. Time of exfiltration, method of exfiltration, exfiltration point.

17. Routes of return.
a. Dismounted.
b. Flight.

18. Time of return.

19. Point of return.

20. Enemy observed on return route.

21. What pre-mission intelligence support was provided and not needed? What intelligence support was not provided but needed? What intelligence was provided but turned out to be misleading or erroneous?

Figure C-9. Sample debrief format (continued).

R&S TEN KEYS TO SUCCESS :

1. Know that the commander's intent or CCIR drives R&S.

2. Support R&S early with integrated staff products.

3. Be adept at abbreviated IPB for quick or combat decisionmaking process.

4. Focus on the event template to capture the moving enemy.

5. Provide situation template depicting enemy in the engagement area.

6. Use automation tools like ASAS to enhance products.

7. Deploy organic R&S assets early and request support from higher HQ. Issue S3 FRAGO with S2 graphic overlay.

8. Provide continuous coverage throughout the depth of the battlefield.

9. Use all possible assets from national levels to scouts.

10. Evaluate reporting and provide immediate and continuous feedback to the commander.

APPENDIX D

PRIORITY INTELLIGENCE REQUIREMENTS, INFORMATION REQUIREMENTS, AND INDICATORS

PIR are intelligence requirements associated with a decision that will affect the overall success of the command's mission. PIR may change in order or be replaced entirely.

IR are requirements for intelligence to fill a gap in the command's knowledge and understanding of the battlefield or threat forces. They target specific COAs.

Indicators are positive or negative evidence of threat activity or any AO characteristic which points toward threat vulnerabilities or adoption or rejection by the threat of a particular capability, or which may influence the commander's selection of a COA.

During wargaming, the S2 develops a set of PIR for each friendly COA. Each is linked to a specific enemy action that requires a friendly response (DPs).

PIR are those IR critical to accomplishing the mission. Wargaming will dictate which IR will become PIR as the mission runs its course.

The S2 should nominate PIR for approval ONLY FROM THE LIST OF ALREADY PLANNED AND COORDINATED IR.

EXAMPLE OF A POOR PIR:

"Will the enemy attack? If so, how, when, where, and in what strength?"

- The PIR contains five significantly different questions. Which one is the priority? Unless the S2 gives more guidance, the individual collector must determine which part of this PIR to work.

- The S2 probably knows more about the situation than "the enemy might attack somehow, sometime, somewhere, and in some strength." The PIR as stated might prompt some collection assets to collect known information.

- Even for issues that the S2 does not know, the enemy can only select from a limited range of COAs due, for example, to terrain, weather, policies. If the PIR consider IPB, the S2, through more specific tasking, will minimize the chance that collection assets will look for the enemy where they are not likely to be.

- When the staff wargames, it may find some aspects of this question to be irrelevant to the present situation. For example, the defense may be fully capable of defeating an enemy attack regardless of when they actually attack. Why waste collection assets on a question that does not need to be answered?

EXAMPLE OF A GOOD PIR:

There is no "set" of PIR we can present that will be useful for all tactical situations any more than there is a set of maneuver paragraphs that the S3 can plug into any OPORD. Below are examples of *types* of PIR the S2 presents to the commander for approval. Because intelligence needs change over time, most PIR will be important only during certain times.

Referring to PIR as "timephased" is redundant. They are dynamic just as the battle will be dynamic. Just as there are no standard situation templates or friendly COAs that will serve in all situations, there is no standard set of PIR. Good PIR, however, have some things in common:

- They ask only one question.
- They focus on a specific fact, event, or activity.
- They provide intelligence required to support a single decision.
- They are tied to key decisions that the commander has to make.
- They give an LTIOV.

Examples:

- "Will the enemy defend OBJ JAMES using a forward slope defense?"
- What size force is defending OBJ NACO?"
- Which bridges over the San Pedro River are intact?"

Not all PIR are appropriate as questions, particularly those associated with moving targets or formations. PIR are *requirements* and should be stated as such when appropriate. In addition, PIR for moving targets must include the requirement to continue to maintain contact with the target. Simply locating the target once will not prevent it from surprising the commander later.

Example: "Locate and track the enemy's battalion reserve."

APPENDIX E

GRAPHIC REPORT FORMATS

Intelligence personnel use a variety of formats to request, report, and disseminate information (see FM 34-3). Personnel working in a joint environment should use JCS Pub 6-04.11. The formats assimilate information into automated intelligence support systems, such as the ASAS.

This appendix concentrates on graphic report formats, specifically the graphic INTSUM and the graphic intelligence estimate. The INTSUM is the main focus, but a graphic intelligence estimate is also provided.

GRAPHIC INTELLIGENCE SUMMARY

The graphic INTSUM is used by units at all echelons to rapidly convey threat situation dynamics. The graphic INTSUM is a current depiction of significant threat dispositions, activities, strengths, and weaknesses and an assessment of the most probable ECOA. A current, complete graphic INTSUM will provide for efficient collection and enable the commander to exploit fleeting threat vulnerabilities.

The graphic INTSUM can be maintained on conventional maps of any scale as an overlay or created electronically and disseminated to computer and television screens. For example, army-level organizations may utilize a 1:250,000 map scale and focus on an army or front-level threat, whereas in SASO activities the deployed unit may utilize a map scale of 1:25,000 or smaller and focus on a platoon or company-size threat.

The graphic INTSUM (Figure E-1) may contain 12 components:

- Legend and margin information.
- Area orientation.
- Threat unit locations and mission activities.
- Threat mission capabilities assessment.
- Threat boundaries and front-line trace.
- Threat objectives.
- Threat air activity.
- Threat weaknesses and vulnerabilities.
- Threat strengths and capabilities.
- Threat intentions assessment.

- Friendly commander's intent and PIR.
- Predicted future threat activity.

LEGEND AND MARGIN INFORMATION:

Components include—

- Overall classification of the INTSUM, posted top and bottom, to include a "Classified By" line and declassification instructions.
- Title.
- Issuing headquarters.
- "As Of" DTG. Use either local or Zulu time; this is critical since predicted threat activity will be depicted based upon the "As Of" DTG plus a given number of hours.
- Map reference, to include scale, and at least two coordinate registration marks.
- A symbology key can be added for increased clarity and **must** be included if symbols used are not in FM 101-5-1.
- SASO symbology is not standardized, but there are several symbol methodologies that have been developed. (See MIPB Jan-Mar 94, p 35.)

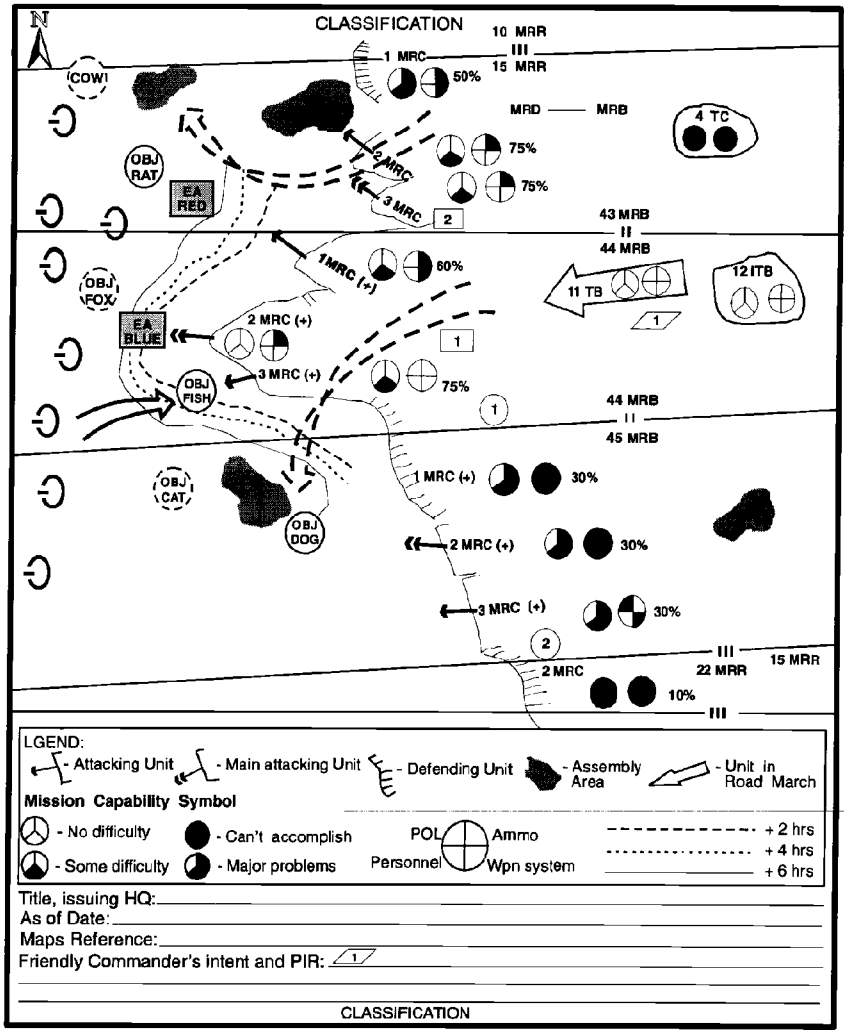

Figure E-1. Graphic INTSUM.

AREA ORIENTATION:

Selected geographic features will be highlighted on the overlay in order to orient the user to the area being displayed. The features selected will depend on the specific AO and type mission in which the friendly unit is involved.

Common features could include cities, rivers, and major relief features. Selected features for some SASO activities may be highlighted on a smaller scale. In an NEO highlighted features could include airports, LOCs, embassies, consulates, and American housing areas, and other features that will play prominently in the operation. Provide only the features necessary for orientation; do not clutter the INTSUM.

THREAT UNIT LOCATIONS AND MISSION ACTIVITIES :

Depict **committed** threat unit locations with a bracket followed by the unit identification. The size of the bracket will indicate the frontage occupied by the unit. The mission of the unit will be shown graphically (Figure E-2).

Depict **uncommitted** threat units with the symbology shown in Figure E-3.

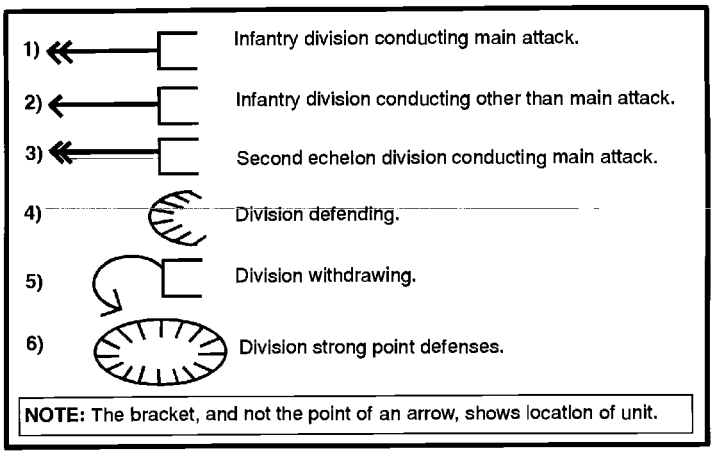

Figure E-2. Threat unit locations and mission activities (committed).

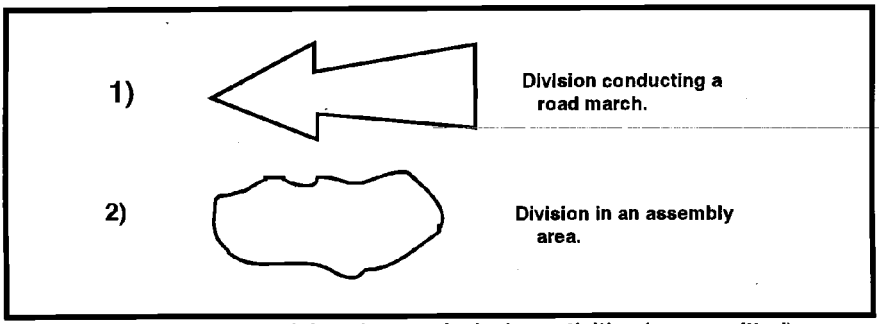

Figure E-3. Threat unit locations and mission activities (uncommitted).

THREAT MISSION CAPABILITIES ASSESSMENT :

Use combat effectiveness graphics to assess and display the capability of a threat unit to perform its mission. Consider all factors, tangible and intangible, in making the assessment; include unit strength, logistics status, maintenance and readiness status, morale, mission, weather, and terrain. Place selected symbols in the vicinity of the unit identification (Figure E-4).

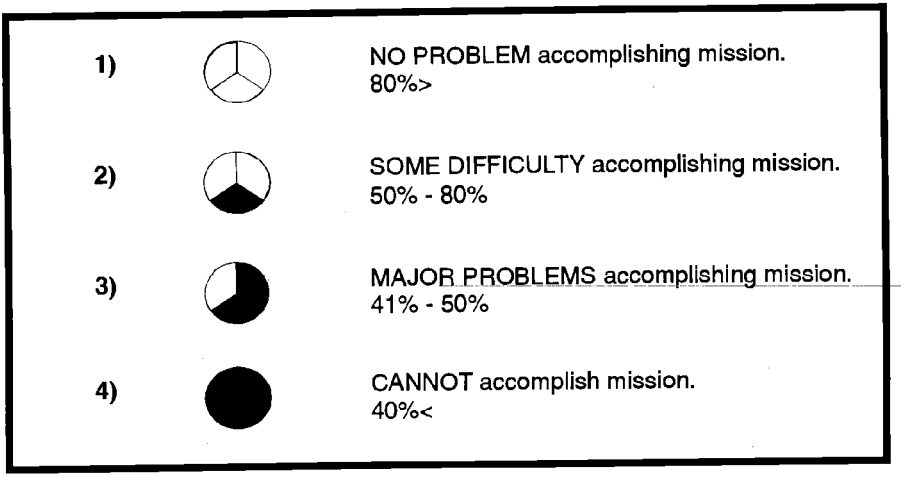

Figure E-4. Threat mission capabilities assessment.

A diminished threat mission capability is due usually to one or more specific problem areas such as damaged or destroyed weapons systems or a lack of ammunition, POL, or replacement personnel. If known, graphically depict these problem areas for each unit immediately next to the threat mission capabilities assessment symbol so the friendly commander can exploit what may be a very crucial, but fleeting, threat vulnerability.

Specific problem areas are indicated by blackening in the appropriate quadrant of the circle. The problem area categories are not static; other problem areas can be selected for display on this symbol as long as the selection is clearly explained in the key. Figure E-5 shows a sample problem area symbol and an example of the problem area symbol used in conjunction with the threat mission capabilities assessment symbol.

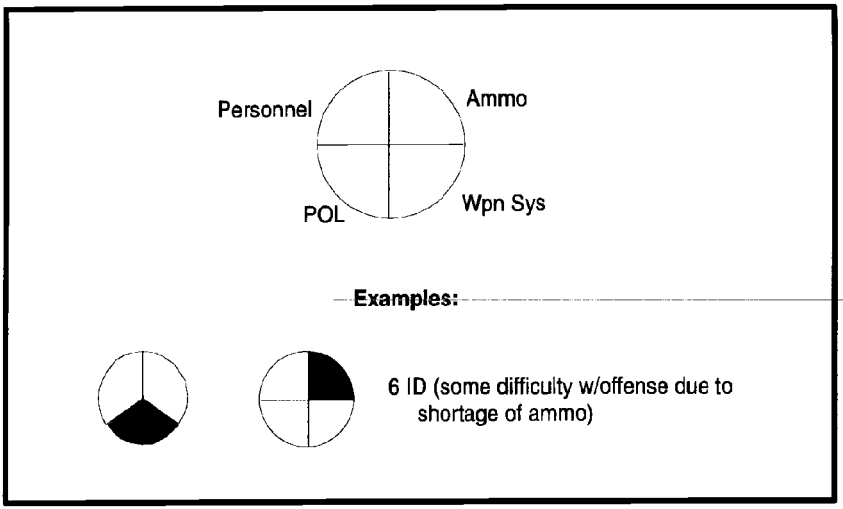

Figure E-5. Threat problem area symbology.

THREAT BOUNDARIES AND FRONT-LINE TRACE:

In conventional military operations, threat boundaries below the division level normally will not be included in the INTSUM. These lower level boundaries are often difficult to delineate and clutter the INTSUM. In some SASO activities, such as support to insurgency and COIN, smaller units will be the rule and must be constantly accounted for on the INTSUM.

The front-line trace will not be shown on the graphic INTSUM. The brackets depicting the frontages of the threat units in contact will suffice for an effective front-line trace. Addition of a front-line trace can be easily confused with the depictions of predicted threat activity.

THREAT OBJECTIVES:

If threat objectives can be discerned, they will be placed on the INTSUM.

THREAT AIR ACTIVITY :

Depict threat air activity on the INTSUM. Use an aircraft symbol with direction of travel and total number of sorties. Some units may opt to break down the sortie count by category, such as fighter (F), bomber (B), and reconnaissance (R). Example: A total sortie count of 12 could be depicted as (12). The same sortie count could also be depicted as (4F/6B/2R). The sortie breakdown should be used only if it will not clutter the INTSUM unnecessarily. Sortie breakdown symbols, such as F, B, and R must also be included (Figure E-6).

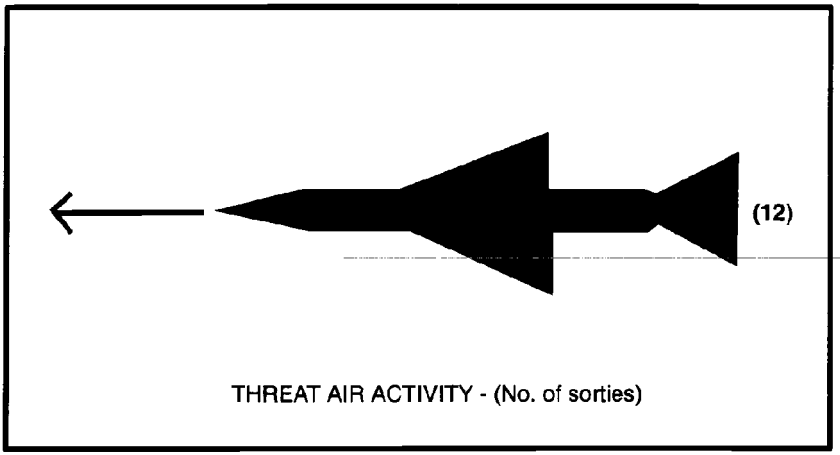

Figure E-6. Threat air activity symbology.

HREAT WEAKNESSES AND VULNERABILITIES:

Show specific weaknesses or vulnerabilities by using a numbered circle on the INTSUM (see Figure E-1). A supporting message could list threat weaknesses and vulnerabilities in narrative form.

THREAT STRENGTHS AND CAPABILITIES :

Show threat strengths and capabilities by using numbered squares (see Figure E-1).

THREAT INTENTIONS ASSESSMENT :

Write an assessment of threat intentions and most probable COA in a concise narrative format; graphically key it to the INTSUM when possible.

FRIENDLY COMMANDER'S INTENT AND PIR :

List the friendly commander's intent and PIR in narrative format on the INTSUM. Graphically key these statements to the overlay.

PREDICTED FUTURE THREAT ACTIVITY :

Draw predicted lines of threat advance or withdrawal and tie them to a timeline to convey as much information about future threat activity as possible (Figure E-7). Predicted lines of advance or withdrawal will be based on the "As Of" time found in the legend and margin information. Remember: Predicted lines are only an aid to planners; current threat situation must be continuously monitored to update the predictions.

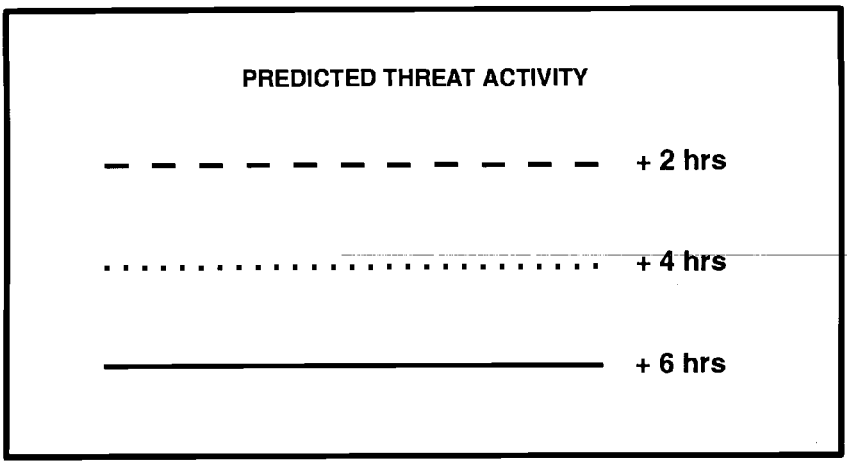

Figure E-7. Predicted threat activity timelines.

APPENDIX F

TARGETING

TARGETING PROCESS

Targeting is the process of selecting targets and matching the appropriate response to them, including operational requirements and capabilities. The purpose of targeting is to disrupt, delay, or limit threat interference with friendly COAs; it requires coordinated interaction between FS operations, intelligence, EW, and plans cells. Targeting is based on the enemy's assets that provide him an advantage (HPTs), friendly scheme of maneuver, and tactical plans. (See FM 6-20-10.)

Target development is one of the six IEW tasks. Mission analysis must precede generating any ECOAs. These ECOAs are the starting point for all other staff actions to wargame against, and to develop follow-on products. The products of the decide function are briefed to the commander. Upon his approval, his decisions are translated into the OPORD with annexes. (See FM 34-130.)

METHODOLOGY

Decisions create the guidelines for the acquisition and engagement of targets. TA and attack are made through a decision cycle. The methodology used to translate the commander's intent into a plan is **DECIDE, DETECT, DELIVER,** and **ASSESS.** Figure F-1 shows the functions of intelligence support to targeting, Figure F-2 shows the targeting methodology, and Figure F-3 is a targeting checklist.

RECEIVE GUIDANCE ON:	• Commander's intent. • HPTs. • Attack criteria. • Lead time between DPs and TAIs. • ROE. • Conditions to establish BDA requirements.
DEVELOP:	• MCOO. • Situation and event templates. • HVTs.
EXPLAIN:	• ECOA as part of wargaming. Based on friendly COA, refine event template; assist in developing HPT list, TSS matrix, and sensor or attack systems matrix.
PRODUCE:	• Collection plan, ISM, and AGM. • SOR.
BRIEF: (Ensure all analysts & collectors understand the CDR's intent.)	• ACE sections (ECOA, HPTL, TSS, and AGM).
COLLECT:	• Information for nomination, validation, and PSA.
DISSEMINATE:	• HPT related information and intelligence to FS immediately. • Pertinent information and BDA per SOP and TTP.
ENSURE:	• Information collection and intelligence production support all FRAGOs.

Figure F-1. Functions of intelligence support to targeting.

DECIDE	DETECT	DELIVER	ASSESS
• Target Development • TVA • HPT and HVT • TSS • Attack Options • Attack Guidance	• Target Detection Means • Detection Procedures • Target Tracking	• Attack • Planned Targets • Targets of Opportunity • Desired Effects • Attack Systems	• Tactical Level • Operational Level • Restrike • Feedback
Tracking your target is applicable during all of these steps.			

Figure F-2. Targeting methodology.

DECIDE:

_____ Do the commander's planning guidance and intent contain enough detail to enable the targeting team to determine—
- — HVTs to nominate as HPTs?
- — Desired effects on each HPT?
- — When to attack each HPT?
- — Any restrictions or constraints?
- — Which HPTs require BDA?

_____ What targeting assets (organic, attached, supporting) are available to detect and attach HPTs?

_____ What detect, deliver, and assess support is needed from higher HQ?

_____ When must requests to higher HQ be submitted to obtain the support when required?

_____ Have target tracking responsibilities been established?

_____ Are systems in place to handoff the detected targets to assets that are capable of tracking them?

_____ What detect, deliver, and assess support is required from subordinate units; when is it required?

Figure F-3. Targeting checklist.

_____ What detect, deliver, and assess support requests have been received from subordinate units; what has been done with them?

_____ Has the AGM been synchronized with the DST and the maneuver and FS plans?

_____ Are all commands using a common datum for locations? If not, are procedures in place to correct differences in data?

DETECT:

_____ Does the collection plan focus on PIR HPTs? (Which includes HPTs designated as PIR?)

_____ What accuracy, timeliness, and validity standards (TSS) are in effect for detection and delivery systems?

_____ Are all TA systems fully employed?

_____ Have backup TA systems been identified for HPTs?

_____ Have responsibilities been assigned to the appropriate unit and/or agency for detecting each HPT?

_____ Are HPTs being tracked?

_____ Have verification procedures using backup systems been established where necessary?

_____ Are TA and BDA requirements distributed properly among systems that can accomplish both?

DELIVER:

_____ Have communications links been established between detection systems, the decisionmaker, and delivery systems?

_____ Have responsibilities been assigned to the appropriate unit and/or agency for attacking each HPT?

_____ Has a backup attack system been identified for each critical HPT? (The primary system may not be available at the time the HPT is verified.)

_____ Have FSCMs or AGMs and clearance procedures been established to facilitate target engagement?

Figure F-3. Targeting checklist (continued).

_____ Have O/O FSCMs or AGMs been established to facilitate future and transition operations?

_____ Have potential fratricide situations been identified; have procedures been established to positively control each situation?

_____ Have responsibilities been assigned to the appropriate unit or agency for tracking specific HPTs and providing BDA on specified HPTs?

_____ What are the procedures to update the HPTL and synchronize the AGM and DST if it becomes necessary to change the scheme of maneuver and FS as the situation changes?

ASSESS:

_____ Are the collection assets linked to specific HPTs still available?

_____ Have the collection asset managers been notified of the attack of a target requiring assessment?

_____ Have assessment asset managers been updated as to the actual target location?

_____ Has all the coordination for the assessment mission, particularly airborne assets, been accomplished?

_____ What is the status of BDA collection?

_____ Has the information from the mission been delivered to the appropriate agency for evaluation?

_____ Has the targeting team reviewed the results of the attack to determine restrike requirements?

_____ Has the target intelligence gathered from the assessment been incorporated into the overall enemy situation development?

Figure F-3. Targeting checklist (continued).

STEP 1 - DECIDE:

DECIDE provides the overall focus and sets priorities for intelligence collection and attack planning (Figure F-4). Targeting priorities must be addressed for each phase or critical event of an operation. The decisions made are reflected in visual products as follows:

- HPTL is a prioritized list of HPTs whose loss to the enemy will contribute to the success of the friendly COA.

- Intelligence collection plan, or R&S plan, answers the commander's PIR, to include those HPTs designated as PIR. The plan, within the availability of additional collection assets, supports the acquisition of more HPTs. Determining the intelligence requirements is the first step in the CM process. (See FMs 34-2 and 34-2-1.)

- TSS matrix addresses accuracy or other specific criteria that must be met before targets can be attacked.

- AGM, approved by the commander, addresses which targets will be attacked, how, when, and the desired effects.

The formats for the HPTLs, TSS, and AGMs are examples only. Targeting personnel must understand all that is involved in building these targeting tools. However, experienced staffs may prefer to develop their own tailored formats.

IPB and Mission Analysis. IPB, including EPB, is a continuous process and starts in the preparation phase. It continues to provide updated as well as new products and supports the targeting process. The intelligence estimate provides key support to target development. MCOOs, doctrinal, situation, event, and DSTs help identify ECOAs, NAIs, TAIs, HVTs.

***TVA and Wargaming*.** The battlefield environment, its effects on combatants, and the threat are considered in IPB analysis to arrive at an intelligence estimate. TVA yields HVTs for a specific ECOA. Target spreadsheets identify the HVTs in relation to a type of operation, and target sheets (see FM 6-20-10, App A) give detailed targeting information for each HVT. This information is used during the IPB and the wargame processes. Both tools are developed by the G2 ASPS.

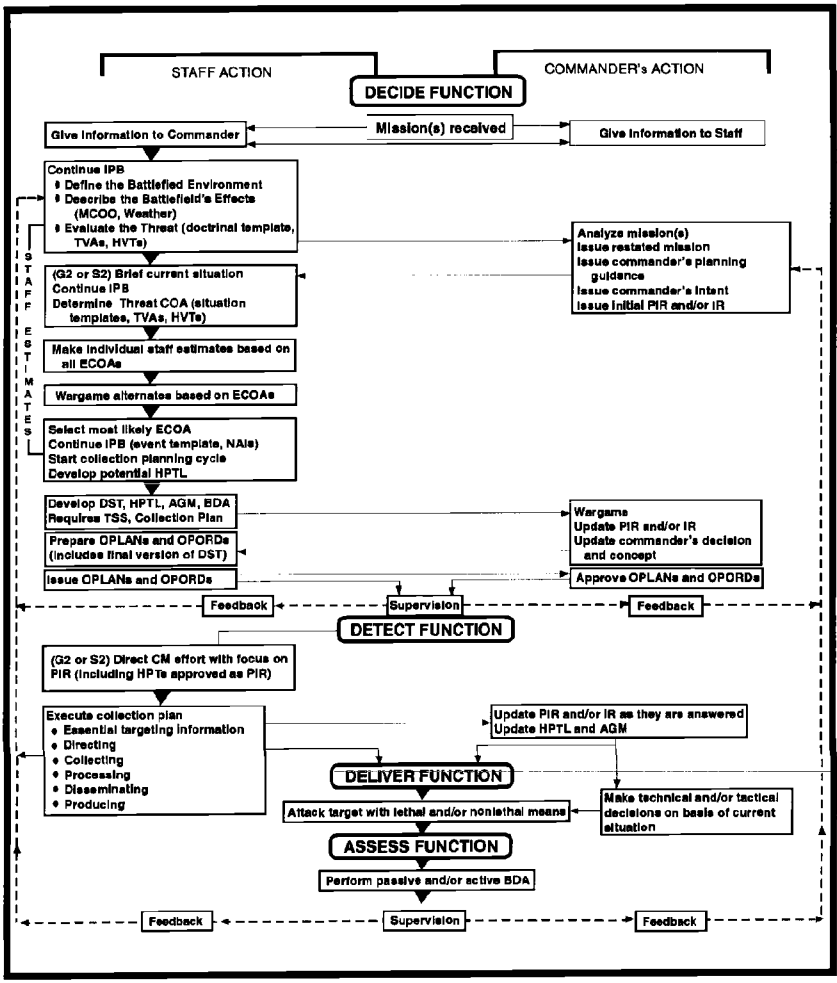

Figure F-4. The targeting process.

TVA, which is a detailed analysis of the enemy in selected COAs, uses the following enemy characteristics:

- Doctrine.
- Tactics.
- Equipment.
- Organizations.
- Expected behavior.

TVA methodology provides a relative ranking of target sets, or categories. It begins when target analysts in the G2/S2 assume the position of enemy commander. The target analyst, in coordination with other staff members, wargames the operation.

During wargaming, alternate friendly COAs are analyzed in terms of their impact on enemy operations and likely responses. The enemy battlefield functions that must be attacked to force the best enemy response are identified. The commander and staff analyze the criticality of friendly battlefield functions on a specific COA. The best places to attack HPTs are identified as TAIs. DPs or decision TPLs are used to ensure that the decision to engage or not to engage occurs at the proper time. Wargaming also identifies HVTs in priority that are critical to the success of the enemy mission. It also identifies the subset of HVTs which are HPTs that must be acquired and attacked for the friendly mission to succeed. HPTs selected are recorded on the DST.

Collection managers evaluate HVTs to determine asset detection capability. HPTs receive priority in the allocation of assets. The FSO determines friendly weapons systems capable of attacking HVTs with lethal fires, and the EWO nominates and coordinates to provide non-lethal fires.

Using the capabilities of the system to attack the targets, the G2/S2 analyzes and synthesizes the threat's response to each attack. Targets should be assigned priorities according to description, signature, degradation, and graphic representation. If targets have the same relative importance, a targeting team must prioritize the targets and seek advice from the FSE targeting analyst and the FAIO. After the targets are prioritized, they are placed on an HPTL (Figure F-5). After the HPTL is approved, the G2 will use it to develop the collection plan.

EVENT OR PHASE:		
PRIORITY	CATEGORY	TARGET

Figure F-5. Example high-payoff target list.

TSS. TSS are criteria applied to enemy activity (acquisitions and battlefield information) used in deciding whether the activity is a target. TSS break nominations into two categories: targets, which meet accuracy and timeliness requirements for attack; and suspected targets, which must be confirmed before any attack.

- HPT. This refers to the designated HPTs which the collection manager is tasked to acquire.
- TIMELINESS. Valid targets are reported to attack systems within the designated timeliness criteria.
- ACCURACY. Valid targets must be reported to the attack system meeting the required TLE criteria. The criteria is the least restrictive TLE considering the capabilities of available attack systems.

Considering these factors, different TSS may exist for a given enemy activity on the basis of different attack systems. For example, an enemy artillery battery may have a 150-meter TLE requirement for attack by cannon artillery and a 1 km requirement for attack helicopters. TSS are developed by the FSE in conjunction with MI personnel. Intelligence analysts use TSS to quickly determine targets from battlefield information and pass the targets to the FSE.

Attack system managers, such as FSEs, FCEs, or FDCs, use TSS to quickly identify targets for attack. Commands can develop *standard* TSS based on anticipated enemy OB and doctrine matched with the normally available attack systems.

The G2/S2 knows the accuracy of acquisition systems, associated TLE, and the expected dwell times of enemy targets. He can then specify whether

information he reports to the attack system manager is a target or a suspected target. Some situations may require the system to identify friendly and neutral from threat before approval to fire is given. HPTs that meet all the criteria should be tracked until they are attacked IAW the AGM. Location of targets that do not meet TSS should be confirmed before they are attacked. The TSS can be depicted in a TSS matrix (Figure F-6).

The matrix lists each system that forwards targets directly to the FSE, FCE, or FDC. The effects of weather and terrain on the collection assets and on enemy equipment are considered. TSS are keyed to the situation. However, the greatest emphasis is on the enemy situation considering deception and the reliability of the source or agency that is reporting.

HPT	TIMELINESS	ACCURACY
COPs	3 hr	150 m
RISTA	30 min	150 m
2S3	30 min	500 m
M-46	30 min	500 m
ADA	15 min	500 m
CPs	3 hr	500 m
Ammunition	6 hr	1 km
Maneuver	1 hr	150 m

Figure F-6. Example target selection standards matrix.

Attack Guidance. Knowing target vulnerabilities and the effect an attack will have on enemy operations allows a staff to propose the most efficient available attack option. Key guidance is whether the commander wishes to disrupt, delay, limit damage, or destroy the enemy. During wargaming, DPs linked to events, areas (NAIs and TAIs), or points on the battlefield are developed. These DPs cue the command decisions and staff actions where tactical decisions are needed.

On the basis of commander's guidance, the targeting team recommends how each target should be engaged in terms of the effects of fire and attack options to use. Effects of fire (see Joint Pub 1-02) can be to **harass, suppress, neutralize,**

or **destroy** the target. The subjective nature of what is meant by these terms means the commander must ensure the targeting team understands his use of them. Applying FS automation system default values further complicates this understanding.

- Harassing fire is designed to disturb the rest of the enemy troops, to curtail movement, and, by threat of losses, to lower morale. The decision to employ harassing fires needs careful consideration. Harassing fire has little real effect on the enemy, subjects gun crews to an additional workload, and increases the threat of counter-battery fires. ROE or the potential for adverse public opinion may prohibit its use. However, harassing fires may be a combat multiplier in some situations. Consider their use in SASO, delaying actions, and economy of force operations.

- Suppressive fire on or about a weapons system degrades its performance below the level needed to fulfill its mission objectives. Suppression lasts only as long as the fires continue. The duration of suppressive fires is either specified in the call for fire or established by SOP. Suppression is used to prevent effective fire on friendly forces. It is typically used to support a specified movement of forces. The FSCOORD needs to ask or calculate the *when* and *how long* questions.

- Neutralization fire is delivered to render the target ineffective or unusable temporarily. Neutralization fire results in enemy personnel or material becoming incapable of interfering with an operation or COA. Key questions the FSCOORD must ask are when and how long does the commander want the target to be neutralized. Most planned missions are neutralization fires.

- Destruction fire is delivered for the sole purpose of destroying material objects. It physically renders the target permanently combat-ineffective unless it is restored, reconstituted, or rebuilt. Setting automated FS default values for destruction of 30 percent does not guarantee achieving the commander's intent. The surviving 70 percent may still influence the operation. Destruction missions are expensive in terms of time and material. **Consider whether neutralization or suppression may be more efficient.**

The decision of what attack system to use is made at the same time as the decision on when to acquire and attack the target. Coordination is required when deciding to attack with two different means (such as EW and combat air operations). Coordination requirements are recorded during the wargame process.

The attack guidance must be approved by the commander and detail the following:

- A prioritized list of HPTs.
- When, how, and desired effects of attack.
- Any special instructions.
- HPTs that require BDA.

This information is developed during the wargame. Attack guidance—

- Applies to planned targets and targets of opportunity.
- May address specific or general target descriptions.
- Is provided to attack system managers via the AGM (Figure F-7).
- May change as the operation progresses.

The AGM must be updated during staff planning meetings and as the enemy situation changes. Consider separate AGMs for each phase of an operation.

PHASE/EVENT: Attack through the security zone				
HPTL	**WHEN**	**HOW**	**EFFECT**	**REMARKS**
COPs	P	GS ARTY	N	PLAN IN INITIAL PREP
RISTA and OPs	P	GS ARTY	N	PLAN IN INITIAL PREP
2S1 and 2S3	P	MLRS	N	PLAN IN INITIAL PREP
2S6, SA9 and SA13	P	GS ARTY	S	SEAD FOR AVN OPS
REGT CP	A	MLRS	N	
RESERVE BN	P	AVN BDE	D	INTENT TO ATTACK RESERVE BN IN EA HOT
LEGEND:	I = IMMEDIATE A = AS ACQUIRED P = PLANNED		S = SUPPRESS N = NEUTRALIZE D = DESTROY	
NOTES: [1]This is only an example of an AGM. Actual matrices are developed on the basis of the situation. [2]An "H" for harassing fires may be included in the EFFECT column during SASO.				

Figure F-7. Example attack guidance matrix.

HPTL. Lists the prioritized HPTs identified during wargaming. They have priority for engagement.

WHEN. Timing the attack of targets is critical to maximizing effects. During wargaming, the optimum time is identified and reflected in the WHEN column. A " **P"** indicates the target should not be engaged now but should be *planned* for future firing (e.g., a preparation, a SEAD program, or a countermobility program) or simply put on file. An **"A"** indicates such targets should be engaged in the sequence received in the headquarters, with respect to the priority noted in the HPTL. An **"I"** indicates the attack

must be *immediate* and is a special case. This designation should be limited to a small percentage of targets and only for the most critical types. Too many immediate targets are disruptive and lower the efficiency of attack systems. Immediate attacks take precedence over all others and are conducted even if attack systems must be diverted from attacks already underway. Examples of important targets include:

- Missile systems capable of NBC attacks.
- Division headquarters.
- NBC weapons storage and support facilities.

MRLS may be considered for immediate attack depending on their demonstrated effectiveness against friendly forces and their tactical employment. The G3/S3 and FSCOORD or FSO must establish procedures within the TOC that allow for immediate attack of targets.

HOW. Links the attack system to the HPT. It is best to identify a primary and backup attack system for attack of HPTs.

EFFECT. Refers to the target attack criteria. The targeting team should specify attack criteria according to the commander's guidance. Target attack criteria should be quantifiable (e.g., percentage of casualties or destroyed elements, time, ordnance, and allocation or application of assets). Also, it can be noted as the number of battery or battalion volleys.

REMARKS. Notes which targets should not be attacked in certain tactical situations (e.g., if the enemy is withdrawing). Examples of how to use this column:

- Accuracy or time constraints.
- Required coordination.
- Limitations on the amount or type of ammunition.
- Any need for BDA.

STEP 2 - DETECT:

DETECT is the next critical function in the targeting process. The G2/S2 is the main figure in directing the effort to detect identified HPTs. To identify who, what, when, and how for TA, the G2/S2 must work closely with the—

- ACE.
- FAIO.
- Targeting officer and FSO.

This process determines accurate, identifiable, and timely requirements for collection systems. The ACE must ensure collection system asset managers understand these requirements.

Information needs for target detection are expressed as PIR and IR. Their priority depends on the importance of the target to the friendly COA and tracking requirements. PIR and IR that support detection of HPTs are incorporated into the overall unit collection plan.

Targets are detected by the maximum use of all available assets. The G2/S2 must focus the intelligence acquisition efforts on the designated HPTs and PIR. Situation development information, through detection and tracking, will be accumulated as collection systems satisfy PIR and IR. The collection manager—

- Considers availability and capabilities of all collection assets within his echelon and those available to subordinate, higher, and adjacent units.
- Considers joint or combined force assets.
- Translates the PIR and IR into SIR and SOR.
- Arranges direct dissemination of targeting information from the collector to the targeting cell or targeting intelligence to the FSE if possible.

Detection Procedures. Use all TA assets effectively and efficiently. Avoid duplication of effort among intelligence available assets unless it is required to confirm target information. At corps and division, the ACE develops and manages the collection plan and ensures that no gaps in planned collection exist. This allows timely combat information to be collected to answer the commander's intelligence and TA requirements. To detect HPTs, give clear and concise

taskings to those TA systems capable of detecting a given target. This information lets analysts develop the enemy situation and identify targets (Figure F-8).

FS personnel provide the G2/S2 with the degree of located accuracy. The accuracy requirements are matched to the TLE of the collection systems. This allows the G2/S2 to develop more detailed TSS. NAIs and TAIs identified are matched with the most capable detection system available. If the target type and its associated signatures (e.g., electronic, visual, thermal) are known, the most capable collection asset can be directed against the target. The asset can be placed in the best position according to estimates of when and where the enemy target will be located.

Assets are positioned based on friendly estimates of where the enemy target is located. Information needed to detect targets are expressed in PIR and IR, which are incorporated into the collection plan. The collection manager translates the PIR and IR into SIR.

The collection manager considers the availability of all collection assets at all echelons. When a target is detected, the information is passed to the FAIO to determine if it is an HPT, its priority, and if it meets the TSS. To ensure that target information is passed quickly, the FAIO should be located in the ACE with communications to the FSE. Once an HPT is discovered, the FAIOs coordinate with their respective G2s/S2s and pass the targets directly to the FSE. If the commander approves the target, it is then passed to a firing unit. Mobile HPTs must be detected and tracked to maintain a current target location. Target tracking is inherent to detection.

BOS	TARGET ACQUISITION MEANS
INTELLIGENCE	SIGINT/EW, IMINT, HUMINT, TECHINT, MASINT systems.
MANEUVER	Patrols, scouts, units in contact, air/ground cavalry/air units.
FS	TAB, AN/TPQ-36/37 radars, FOs, AFSOs, COLTs.
AD	ADA scouts, ADA system's acquisition radars.
MOBILITY, COUNTER-MOBILITY, SURVIVABILITY	Engineer and NBC reconnaissance.
CSS	Truck drivers, base cluster recon/counterrecon patrols.
C^2	MIJI reports.
AIR FORCE	Joint STARS, AWACS.

Figure F-8. BOS detection capabilities.

As the assets collect information for target development, the information is forwarded to ACE intelligence analysts who use the information to perform situation and target development. Once a target specified for attack is identified, the analysts pass it to the FSE. The FSE executes the attack guidance against the target. Coordination between the intelligence staff and the FSE is essential to ensure that the targets are passed to an attack system that will engage the target.

The FAIOs can coordinate with the G2 and FSE to pass HPTs and other targets directly to the FCE at the division artillery TOC or, if approved by the maneuver commander, directly to a firing unit. The result is an efficient attack of targets which have been designated in advance for attack.

When the FAIO gets intelligence information which warrants attack, he notifies the FSE. This allows the FAIO to focus on intelligence analysis and the FSE to manage the control of fires. The targeting officer at the maneuver brigade and the S2 at the battalion perform FAIO functions.

Tracking priorities are based on the commander's concept of the operation and targeting priorities. Tracking is executed through the collection plan. Not all targets will be tracked. Because many critical targets move frequently or constantly, these HPTs require tracking.

Synchronization of Intelligence Collection. While conducting operations, the G2/S2 monitors execution of the collection plan. He uses an ISM to synchronize the intelligence system in order to give answers to PIR in time to affect the decisions they support. As HPTs are identified, he informs the appropriate FSE and cross-cues collection assets to support BDA as needed.

During delivery, NRT collectors and observers are cued to continue tracking targets during their engagement. Planned or cued BDA collection and reporting help determine if the engagement produced the desired effects. If not, continued tracking supports immediate reengagement.

To facilitate hand-off of target and tracking responsibilities, the G2/S2 coordinates with higher and subordinate units. Requirements for intelligence in a given area can then be directed to the unit responsible for that area. Operational graphics are useful when tracking particular threat units or HPTs. Passing responsibility for the target as it crosses the graphic ensures that it is not lost in crossing.

Synchronization continues during the CM process. The G2/S2 uses the products of the targeting process to develop SIR and SOR that synchronize the collection effort with command DPs. He plans and allocates time for collection, processing, and dissemination.

During execution the collection manager monitors the collection and reporting to ensure synchronization. He prompts asset managers to meet timelines, cross-cueing, and retasking as necessary to keep intelligence operations synchronized with command operations.

IEW Systems. The collection manager at each echelon gives appropriate IEW agencies missions through the collection plan and ISM. The intelligence analyst directly supports the collection manager. To properly synthesize information being received from forward units and collection systems intelligence analysts must understand their capabilities and limitations.

Figure F-9 explains the intelligence disciplines that provide targeting information through collection.

DISCIPLINE	FUNCTION
SIGINT/EW	• Friendly SIGINT/EW systems search for, intercept, and locate threat electronic signals emanating from radios, radars, and beacons. • Signatures are caused by electronics associated with the particular C^2 functions of the target. • Signatures identify signals based on characteristics of the signal or content of any messages intercepted. • The signals are then associated with an adversary's OB. • Electronic systems organic to tactical and operational (corps and theater) EW units can locate threat radio, radar, beacon, and C^2 system emissions using DF equipment. • DF efforts have inherent considerations that affect target accuracy such as DF system accuracy, terrain, and distance to target.
IMINT	• Imagery assets can be located in the AEB of the corps MI Bde, GRCS, and GS and DS companies of the Div MI Bn TUAV when fielded. • TUAV is organic to the DS Co of a heavy division. • TUAV is organic to the GS Co in a light infantry division. • FCE is assigned to the GS Co. • Predator UAV and Joint-STARS are USAF assets. They include airborne and ground-based IMINT sensors such as photo, TV, infrared, and MTI radar. • Targets have visual and infrared signatures that can be imaged. • Imagery analysts study results of IMINT missions to determine the presence, location, and assessed damage to threat targets. These films and devices can detect thermal signatures produced by equipment (engines, heaters, or any device producing or absorbing heat). These devices can also differentiate camouflaged equipment and structures. • Mounted sensors in UAVs provide TA capability which can locate threat elements unseen by ground observers and

Figure F-9. Intelligence disciplines.

	can successfully direct engagement of the targets. SLAR can detect the movement of vehicles beyond visual range of ground observers. • Imagery and intelligence analysts look for the threat's patterns of activity or intentions produced from IMINT systems. • Patterns of movement (numbers, direction, times) are analyzed and synthesized with other combat information to determine a threat commander's intentions. • Imagery can be requested from national and theater systems to support area studies and operations. • Imagery can also be used for training in garrison and at CTCs.
HUMINT	• HUMINT is produced by LRSUs, CI teams that are positioned throughout the depth of the battlefield, and interrogation teams that may be at maneuver battalions and higher. • Interrogation of threat prisoners can be focused on the detection of HVT and HPTs. • Interrogators should receive lists of intelligence interests and the commander's PIR. • Giving current HPTLs to the interrogators allows them to focus their efforts on locating these targets while gleaning additional information for situation development. • LRSUs are another HUMINT source. They may be tasked to determine the presence or absence of threat activity within the NAIs developed during the IPB process. • Keying these NAIs to HPTs allows the LRSUs to contribute significantly to the target detection process. • Information gained from LRSUs is real or NRT and can result in immediate engagement. • Due to extensive preparation and support requirements, LRSUs should be planned early and used IAW its doctrine (e.g., depth, target selection, insertion techniques). • CI teams detect subversion, espionage, and terrorist threats to friendly forces, and can also work with the local population to gather items of intelligence interest. • SOF may be tasked through SOCCE assigned at brigade, division, or Corps.

Figure F-9. Intelligence disciplines (continued).

TECHINT	• The TECHINT system is made up of two parts: S&TI and battlefield TECHINT. • S&TI supports strategic level of war intelligence. • Battlefield TECHINT supports operational and tactical levels of war intelligence. • TECHINT aids the commander by providing products that either identify or counter an adversary's monetary technological advantage. • TECHINT is an integral part of all-source intelligence because it involves everyone from individual soldiers to the policy makers. • Foreign material is photographed or captured and exploited for information, capabilities, limitations, and vulnerabilities. • The 203d MI Battalion operates the CMEC for the Army, or forms the Army's component of JCMEC or CCMEC. • Teams are sent from the battalion down to ECB units. • The G2, G3, TECHINT commander, and MI commander comprise the battlefield TECHINT team. • The commanders execute the staff's directives to collect materials for the TECHINT teams to exploit.
MASINT	• A MASINT sensor collects energy emitted by or reflected from an object or event for the purpose of identification and characterization. • Enemy weapon systems have physical characteristics and distinct performance identifiers when used. • Dynamic targets and events are primary candidates for MASINT exploitation by the MI force projection brigades. • These sources create energy emissions across the EM spectrum which carry information about its characteristics and performance via waves or particles. • This information is the signature collected by MASINT sensors; it can be used when developing threat assessments, OBs, IPB, and targeting materials. • MASINT data becomes invaluable during the rapid reprogramming of *smart* weapons and sensors or when changing tactics.

Figure F-9. Intelligence disciplines (continued).

STEP 3 - DELIVER:

DELIVER executes the target attack guidance and supports the commander's battle plan once the HPTs have been located and identified (Figure F-10).

ATTACK OF TARGETS MUST:	■ Satisfy attack guidance developed in *decide* function. ■ Require two categories of decisions—*tactical* and *technical*.
TACTICAL DECISIONS DETERMINE:	■ Desired effect, degree of damage, or both. ■ Attack system to be used. ■ Time of attack. This is determined IAW type of target: Planned target or target of opportunity. ; **PLANNED TARGET:** –Some targets will not appear as anticipated. –Target attack takes place only when the forecasted enemy activity occurs in projected time or place. Detection & tracking of activities associated with target becomes trigger for target attack.
TARGETING TEAM:	
G2 RESPONSIBILITIES:	■ Verifies enemy activity as the planned target to be attacked. ■ Validates target by conducting final check of reliability of source & accuracy (time & location) of target. Passes target to FSE. ■ Current operations officer checks legality of target in terms of the ROE.
FSE RESPONSIBILITIES:	■ Determines if attack systems planned are available & still best systems for attack. ■ Coordinates with higher/lower/adjacent units, other services, allies & HN (important where potential fratricide situations are identified).

Figure F-10. Deliver functions and responsibilities.

	■ Issues fire mission request to appropriate executing units. ■ Informs G2 of target attack. G2 alerts appropriate system responsible for BDA (when applicable). ; **TARGETS OF OPPORTUNITY:** –Are processed the same as planned HPTs. –Those not on HPTL are first evaluated to determine when or if they should be attacked. ■ Decision to attack follows attack guidance & is based on— •Activity of the target. •Dwell time. •Target payoff compared to other targets currently being processed for engagement. –If decision is made to attack immediately, target is processed further. –Availability & capabilities of attack system to engage targets are assessed. –If target exceeds availability or capabilities, send target to higher HQ for immediate attack. –If decision is to defer attack, continue tracking; determine DPs for attack, and modify collection taskings as appropriate.
TECHNICAL DECISIONS (DETERMINED BASED ON TACTICAL DECISIONS):	■ Precise delivery means. ■ Number and type of munitions. ■ Unit to conduct the attack. ■ Response time of the attacking unit. ■ Results in physical attack of targets by lethal and/or nonlethal means. ■ FS cell directs attack system to attack target once tactical decisions have been made. ■ FS cell provides attack system manager with—

Figure F-10. Deliver functions and responsibilities (continued) .

	•Selected time of attack. •Effects desired IAW previous discussion. •Any special restraints or requests for particular munitions types. ■ Attack system manager (FSCOORD, ALO, AVN BDE, LNO, NGLO) determines if his system can meet requirements. If cannot, he notifies FS cell. Some reasons for not being able to meet requirements include— •System not available at specified time. •Required munitions not available. •Target out of range. ■ FS cell must decide if selected system should attack under different criteria or if a different system should be used.
TARGETS OF OPPORTUNITY ARE ATTACKED BASED ON:	■ The target's activity. ■ Estimated assembly area activity.
DESIRED EFFECTS: **DISRUPT** **DELAY** **LIMIT**	■ Planned Targets: •Verify enemy activity as that planned to be attacked. •Reaffirm decision to attack. •Issue the fire mission request (through FS cell) to appropriate executing units. ■ Targets of Opportunity: •Targeting team must decide payoff and availability of attack systems and munitions.
ATTACK SYSTEM:	■ Planned Targets: •Decision made during *decide* function. •Determine system availability & capability. •Targeting team must determine best system available to attack target if system not available or capable.

Figure F-10. Deliver functions and responsibilities (continued).

	■ Targets of Opportunity: •Targeting team must determine attack system, subject to maneuver commander's approval. •Consider all available attack systems. •Attacking targets should optimize capabilities of— –Light and heavy ground forces. –Attack helicopters. –FA. –Mortars. –Naval gun fire. –Combat air operations (CAS and air interdiction). –Offensive EW. •Consider availability & capabilities of each resource using the following: –Desired effects on the target. –Payoff of the target. –Degree of risk to use asset against target. –Impact on friendly operations. •Target attack must be coordinated among two or more attack systems. •Engaging a target by lethal means, along with jamming or monitoring, may be of greater benefit than simply firing at the target.

Figure F-10. Deliver functions and responsibilities (continued).

STEP 4 - ASSESS:

Combat assessment is the determination of the effectiveness of force employment during military operations. It is composed of three elements:

- BDA, which is the timely and accurate estimate of damage resulting from the application of lethal or nonlethal military force against a target.
- MEA, which is an assessment of the military force in terms of weapon systems and munitions effectiveness.

- Reattack recommendation.

In combination, BDA and MEA inform the commander of effects against targets and target sets. Based on this, the threat's ability to make and sustain war and centers of gravity are continuously estimated. During the review of the effects of the campaign, restrike recommendations are proposed or executed. BDA pertains to the results of attacks on targets designated by the commander. Producing BDA is primarily an intelligence responsibility, but requires coordination with operational elements. BDA requirements must be translated into PIR. It accomplishes the following:

- At the tactical level, commanders use BDA to get a series of timely and accurate snapshots of their effect on the enemy. It provides commanders an estimate of the enemy's combat effectiveness, capabilities, and intentions. This helps commanders determine when or if their targeting effort is accomplishing their objectives.

- BDA helps to determine if restrike is necessary. Commanders use BDA to allocate or redirect attack systems to make the best use of available combat power.

The G3 through the targeting team conducts MEA concurrently and interactively with BDA as a function of combat assessment. MEA is used as the basis for recommending changes to increase effectiveness in—

- Methodology.
- Tactics.
- Weapon systems.
- Munitions.
- Weapon delivery parameters.

The G3 develops MEA by determining the effectiveness of tactics, weapons systems, and munitions. Munitions effect on targets can be calculated by obtaining rounds fired on specific targets by artillery assets. The targeting team may generate modified commander's guidance concerning—

- UBL.
- RSR.
- CSR.

The need for BDA for specific HPTs is determined during the **decide** function. Record BDA on the AGM and intelligence collection plan. The resources used for BDA are the same resources used for target development and TA. An asset used for BDA may not be available for target development and TA. The ACE receives, processes, and disseminates to the targeting team the results of attack, which are analyzed in terms of desired effects.

The targeting team must keep the following BDA principles in mind:

- BDA must measure things that are important to commanders, not make important the things that are easily measurable.
- BDA must be objective. When a G2/S2 receives a BDA product from another echelon, he should verify the conclusions (time permitting). G2s/S2s at all echelons must strive to identify and resolve discrepancies among the BDA analysts at different headquarters.
- The degree of reliability and credibility of the assessment relies largely upon collection resources. The quantity and quality of collection assets influence whether the assessment is highly reliable (concrete, quantifiable, and precise) or has low reliability (best guess). The best BDAs use more than one collection discipline to verify each conclusion.

Each BDA has three assessment components (Figure F-11). Each requires different sensors, analytical elements, and timelines. They are not necessarily subcomponents of each BDA report. (See FM 6-20-10, Appendix D.)

COMPONENTS	DESCRIPTION
PDA	• Qualitative physical damage from munitions blast, fragmentation, and fire. • Based on observed or interpreted damage.

FDA	• Effects of military force to degrade or destroy capability of target to perform mission. • Assessment based on all-source intelligence. • Includes an estimate of time to reconstitute or replace target. • Temporary assessment compared to a TSA used for specific missions.
TSA	• The overall impact of the full spectrum of military operations on an entire target system's capability. • Can be applied against an adversary's combat effectiveness. • May address significant subdivisions of a target. • A more permanent assessment.

Figure F-11. BDA functions.

BDA is more than determining the number of casualties or the amount of equipment destroyed. The targeting team can use other information, such as—

- Whether the targets are moving or hardening in response to the attack.
- Changes in deception efforts and techniques.
- Increased communication efforts as the result of jamming.
- Whether the damage achieved is affecting the enemy's combat effectiveness as expected.

BDA may also be passive by compiling information regarding a particular target or area (e.g., the cessation of fires from an area). If BDA is to be made, the targeting team must give intelligence acquisition systems adequate warning for sensors to be directed at the target at the proper time. BDA results may change plans and earlier decisions. The targeting team must periodically update the decisions made during the **decide** function concerning—

- IPB products
- HPTLs.
- TSS.
- AGMs.
- Intelligence collection plans.
- OPLANs.

Based on BDA and MEA, the G2/G3 consider the level to which operational

objectives have been achieved and make recommendations to the commander. Reattack and other recommendations should address operational objectives relative to the—

- Target.
- Target critical elements.
- Target systems.
- Enemy combat force strengths.

BDA key players are the commander, operations officer, FSO, AAO, ALO, and S2. The S2 integrates intelligence and operational data. In coordination with the G3, the G2/S2—

- Recommends HPTs.
- Develops and recommends IR to include those for targeting and BDA. Some requirements become PIR.
- Coordinates with the G3/S3, AAO, and FSO to develop a fully coordinated targeting and BDA plan.
- Develops a synchronized collection plan to answer the commander's IR and tracks and maintains BDA charts and files.
- Tasks or requests collection support from the appropriate unit or agency to collect information required to satisfy the commander's targeting objectives and BDA reporting requirements.
- Establishes procedures to ensure reports from FOs, scouts, troops in contact, pilots, and AVTRs are quickly made available for BDA analysis.
- Matches BDA reporting requirements against the commander's objectives to determine targeting effort drain; develops and maintains historical BDA databases, and disseminates hard and soft copy intelligence and BDA results.
- Uses the results of BDA and combat assessment to determine the need to develop further threat COAs.
  - — Determines priority for collection assets between the targeting effort and

the BDA supporting requirements.

— Determines and updates enemy capabilities based upon results of the targeting effort.

SASO CONSIDERATIONS

Target development and targeting are difficult in an SASO environment. Although the principles of the targeting process still apply in SASO, consider the following:

- ROE tend to be more restrictive than in conventional combat situations. Everyone involved in the targeting process must completely understand the ROE.
- Identification of HVTs, threat intentions, threat locations, and weapons systems is slow to develop and may not be able to be acted upon when fully developed.
- Because of the nature of the threat (usually a relatively small, unconventional enemy may constitute a significant threat to US forces) determination of HVTs (specifically, what constitutes an HVT) is extremely difficult. Thus, it is difficult to develop precise time, location, and rates of march for a threat force.
- "Targets," which blend into the population, are often less visible than conventional targets.
- When identified, targets present less of a window of opportunity in which to react, decreasing decision time.
- Because of considerations of the HN population, targeting must be precise. Selecting the right weapons system for the right target is paramount.
- Interaction and coordination with nontraditional elements and agencies may be required. This may include private organizations, NGOs, other federal agencies, civil agencies, allies or coalition forces, and HN forces.

CARVER TECHNIQUE

ARSOF uses CARVER factors to assess mission, validity, and requirements. They are also used in technical appreciation and target analysis.

The CARVER selection factors assist in selecting the best targets or components to attack. As the factors are considered, they are given a numerical value, which represents the desirability of attacking the target. The values are then placed in a decision matrix. After CARVER values for each target or component are assigned, the sum of the values indicates the highest value target or component to be attacked within the limits of the statement of requirements and commander's intent. Figure F-12 explains the CARVER techniques.

	DESCRIPTION	FACTORS	CRITERIA & VALUES*	SCALE
Criticality	•Means target value. •Primary consideration in targeting. •Target is critical when its destruction or damage has major impact on military, political, or economic operations. •Consider targets within a system in relation to other elements of the target system. •Value of target will change as situation develops. •Target requires use of time-sensitive methods which respond to changing situation. **EXAMPLE:** When one has few locomotives, railroad bridges may be less critical as targets; however, safeguarding bridges may be critical to maneuvering conventional forces requiring use of such bridges.	•Time—How rapidly will impact of target attack affect operations? •Quality—What % of output, production, or service will be curtailed by target damage? •Surrogates—What will be effect on output, production, and service? •Relativity—How many targets? What are their positions? How is their relative value determined? What will be affected in the system or complex stream?	•Immediate halt; target cannot function without it. •Halt within 1 day, or 66%. •Halt within 1 week, or 33%. •Halt within 10 days, or 10%. •No significant affect. *Refers to time or %; curtailment in output, production, or service.	9 to 10 7 to 8 5 to 6 3 to 4 1 to 2

Figure F-12. CARVER techniques.

	DESCRIPTION	FACTORS	CRITERIA & VALUES*	SCALE
Accessibility	•Target is accessible when operations element can reach the target with sufficient personnel and equipment to accomplish mission. •Entails identifying & studying critical paths the operational element must take to achieve objectives & measuring those things that aid or impede access. •You must be able to reach target AND remain there for extended periods. •Basic steps identifying accessibility: –Infiltration from staging base to target. –Movement from point of entry to target/objective. –Movement to target's critical element. –Exfiltration.	•Active & passive EWS. •Detection devices. •AD capabilities within target area. •Road & rail transportation systems. •Type terrain & its use. •Concealment & cover. •Population density. •Other natural or synthetic obstacles & barriers. •Current & climatic weather conditions. •Analysis along each critical path to target should measure time it would take for action element to bypass, neutralize, or penetrate barriers/ obstacles. •Measured by relative ease or difficulty of movement for operational element & likelihood of detection. Consider using standoff weapons in such evaluations.	•Easily accessible standoff weapons can be employed. •Inside a perimeter fence but outdoors. •Inside a building but on ground floor. •Inside a building but on second floor or in a basement; climbing or lowering is required. •Not accessible or inaccessible without extreme difficulty.	9 to 10 7 to 8 5 to 6 3 to 4 1 to 2

Figure F-12. CARVER techniques (continued).

	DESCRIPTION	FACTORS	CRITERIA & VALUES*	SCALE
Recuperability	•Measured in time—How long will it take to replace, repair, or bypass destruction of or damage to the target? •Varies with sources and type of targeted components and availability of spare parts availability.	•Onhand equipment such as railroad cranes, dry docks, and cannibalization. •Restoration and substitution through redundancies. •Onhand spares. •Equivalent OB equipment sets that backup critical equipment or components; effects of economic embargoes and labor unrest.	Replacement, repair, or substitution requires— •1 month or more. •1 week to 1 month. •72 hours to 1 week. •24 to 72 hours. •Same day replacement, repair, or substitution.	9 to 10 7 to 8 5 to 6 3 to 4 1 to 2
Vulnerability	•Target is vulnerable if operational element has means & expertise to successfully attack the target. •Scale of critical component needs to be compared with capability of attacking element to destroy or damage it. •Attacking element may tend to— –Choose special components. –Do permanent damage.	•Depends on— –Nature and construction of the target. –Amount of damage required. –Assets available, (e.g., personnel, expertise, motivation, weapons, explosives, and equipment.)	•Vulnerable to long-range laser target designation, small arms fire, or charges of 5 lbs or less. •Vulnerable to light antiarmor weapons fire or charges of 5 to 10 lbs.	9 to 10 7 to 8

Figure F-12. CARVER techniques (continued).

	DESCRIPTION	FACTORS	CRITERIA & VALUES*	SCALE
	–Maximize effects through use of onsite materials. –Cause the target to self-destruct.		•Vulnerable to medium antiarmor weapons fire, bulk charges of 10 to 30 lbs, or very careful placement of smaller charges.	5 to 6
			•Vulnerable to heavy antiarmor fire, bulk charges of 30 to 50 lbs, or requires special weapons.	3 to 4
			•Invulnerable to all but the most extreme target-ting measures.	1 to 2
Effect	•Measure of possible military, political, economic, psychological & sociological impacts at target & beyond. •Closely related to the measure of target criticality. •Type & magnitude of given effects desired will help planners select targets & target components.	•Primary effect of destruction of 2 adjacent long-range radar sites in EWS may be to open hole in system that is of sufficient size & duration to permit attacker to launch a successful air or missile nuclear strike against defender.	•Overwhelmingly positive effects; no significant negative effects.	9 to 10
			•Moderately positive effects; few significant negative effects.	7 to 8
			•No significant effects; neutral.	5 to 6
			•Moderately negative effects; few significant positive effects.	3 to 4

Figure F-12. CARVER techniques (continued).

	DESCRIPTION	FACTORS	CRITERIA & VALUES*	SCALE
	•Addresses all significant effects, whether desired or not, that may result once selected target component is attacked. •Traditionally, this element addressed effect on local population; now there are broader considerations. •Frequently neutral at tactical level.	•Can include— –Triggering of counter-measures. –Support of negation of PSYOP themes. –Unemploy-ment. –Reprisals against civilian popu-lace. –Collateral damage to other targets. •Possible effects can be specula-tive & thus should be labeled. •Effects of same attack may be different at tactical, opera-tional & strategic levels. **EXAMPLE:** Destruction of a substation may not affect local power but cuts off power to adjacent region.	•Overwhelmingly negative effects; no significant positive effects.	1 to 2

Figure F-12. CARVER techniques (continued).

	DESCRIPTION	FACTORS	CRITERIA & VALUES*	SCALE
Recognizability	•Target's recognizability is degree to which it can be recognized by an operational element or intel collection & recon assets under varying conditions. •Weather impacts visibility. •Rain, snow & ground fog may obscure observation. •Road segments with sparse vegetation & adjacent high ground provide excellent conditions for good observation. •Distance, light & season must also be considered.	•Site & complexity of target. •Existence of distinctive target signatures. •Presence of masking or camouflage. •Technical sophistication & training of attackers.	•Target is clearly recognizable under all conditions & from a distance; requires little or no training. •Target is easily recognizable at small-arms range & requires small amount of training. •Target is difficult to recognize at night or in bad weather, or might be confused with other targets or components; requires some training. •Target is difficult to recognize at night or in bad weather, even within small-arms range; it is easily confused with other targets or components; requires extensive training. •Target cannot be recognized under any conditions, except by experts.	9 to 10 7 to 8 5 to 6 3 to 4 1 to 2

	DESCRIPTION	FACTORS	CRITERIA & VALUES*	SCALE

Figure F-12. CARVER techniques (continued).

CARVER factors and their assigned values are used to construct a CARVER matrix. Table F-1 is a tool for rating the desirability of potential targets and allocating attack resources.

- List the potential targets in the left column.
- For strategic level analysis, list the enemy's systems or subsystems (electric power supply, rail system).
- For tactical level analysis, list the complexes or components of the subsystems or complexes selected for attack by your higher HQ.
- As each potential target is evaluated for each CARVER factor, enter the appropriate value into the matrix.
- Once all the potential targets have been evaluated, add the values for each potential target.
- The sums represent the relative desirability of each potential target; this constitutes a prioritized list of targets.
- Attack those targets with the highest totals first.
- If additional men or munitions are available, allocate these resources to the remaining potential targets in descending numerical order.
- This allocation scheme will maximize the use of limited resources.

The S2 can use the CARVER matrix to present operation planners with a variety of attack options. With the matrix, he can discuss the strengths and weaknesses of each COA against the target. Having arrived at conclusions through the rigorous evaluation process, the S2 can comfortably defend his choices.

Table F-1. Bulk electric power supply.

POTENTIAL TARGETS	C	A	R	V	E	R	TOTAL
Fuel Tanks	8	9	3	8	5	6	41
Fuel Pumps	8	6	2	10	5	3	34
Boilers	6	2	10	4	5	4	31
Turbines	8	6	10	7	5	9	45
Generators	4	6	10	7	5	9	41
Condenser	8	8	5	2	5	4	34
Feed Pumps	3	8	5	8	5	6	33
Water Pumps	3	8	5	8	5	4	33
Generator Step up Transformer	10	10	10	9	5	9	53

APPENDIX G

IEW SYSTEMS

QUICKFIX (AN/ALQ-151(V1)) Advanced QUICKFIX (AN/ALQ-151(V2))

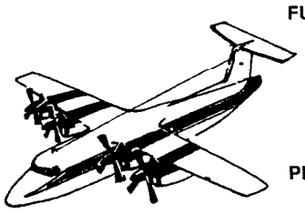
FUNCTION: VHF DF intercept, VHF EA, VHF DF (nets w/TRAILBLAZER for DF). Component of IEWCS AF/VHF/UHF ES

PRIME MOVER: EH-60A, EH-60L (BLACKHAWK)

UNIT AND QTY: HVY DIV: 3 Systems 3 Flt Plt, Avn Bde; LT DIV: 3 Systems, 3 Flt Plt, Avn Bde; AASLT DIV: 3 Systems, 3 Flt Plt, HHOC, MI Bn; ABN DIV: 3 Systems, 3 Flt Plt, Cbt Avn Sqdn; ACR: 3 Systems, 3 Flt Plt, Cbt Avn Sqdn

INTEL APPLICATION: COMINT

Airborne Reconnaissance Low (ARL)



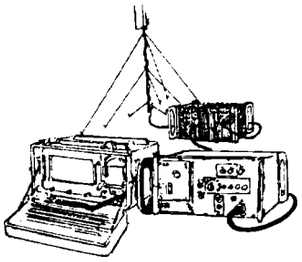
FUNCTION: Ground processing station, ACT 101 remote rcv sets, TACLINK video rcv sets, FLIR system, daylight imaging systems, infrared line scanner, radio intercept/DF systems; interoperates w/ASAS & CTT

PRIME MOVER: DHC-7 arrives ready for immediate employment

UNIT AND QTY: Select Brigades

INTEL APPLICATION: COMINT/IMINT

Commander's Tactical Terminal (CTT), AN/TSC-125



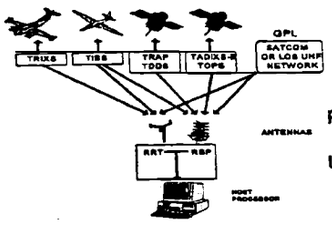
FUNCTION: Communications terminal; GUARDRAIL downlink on TRIXS network; RRS on board RC-12 & U2-R, RRTS; includes OT, RBP, RRT, LOS adaptive array antenna, SDS, embedded COMSEC

PRIME MOVER: NA

UNIT AND QTV: 1- MI at all echelons

INTEL APPLICATION: SIGINT

Joint Tactical Terminal: JTT/H3 (AN/USC-55)
JTT/H-R3 (AN/USR-6)



FUNCTION: Communications terminal, 2 LRUs, 1 RBP, 1 RRT, host processor & antenna array (both user provided); mobile & mountable in F/W & R/W, tracked & wheeled vehicles, shelters

PRIME MOVER: NA

UNIT AND QTY: Avn, ADA, FA, MI at all echelons; integrated into GSM/CGS, ASAS, ETRAC, THAADS, Patriot, JTAGS, TROJAN SPIRIT, AFATDDS, other multiservice systems

INTEL APPLICATION: SIGINT

Ground-Based Common Sensor (GBCS)

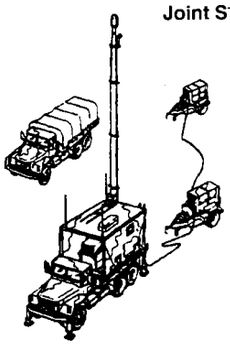
FUNCTION: ES (intercept& DF); EA (jamming); COMINT targeting location data; common subsystems with AQF & MEWSS

PRIME MOVER: EFVS (HVY DIV) or HVY HMMWV (LT DIV)

UNIT AND QTY: 6 GBCS-H per MI Bn (H); 4 GBCS-H per MI Co (ACR); 4 GBCS-L per MI Bn (ABN, AASLT, LT); 6 per MI Bn (H, LT, ABN, AASLT, DIV); 6 per MI Co; ACR

INTEL APPLICATION: COMINT/ELINT

Joint STARS Ground Station Module (GSM) (AN/TSQ-132)

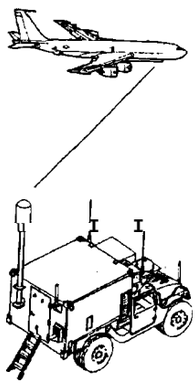


FUNCTION: MTI, FTI, SAR imagery; supports situation development, battle mgt, targeting, force protection, limited BDA/TDA, operations planning

PRIME MOVER: LT - 2xHMMWV; MED - 2X5-ton HMMWV

UNIT AND QTY: 6- Selected DIV; 6- Selected Corps; 1- ACR; 1- EAC

INTEL APPLICATION: IMINT/SIGINT/INTEL/ ARTY/AVN SUPPORT



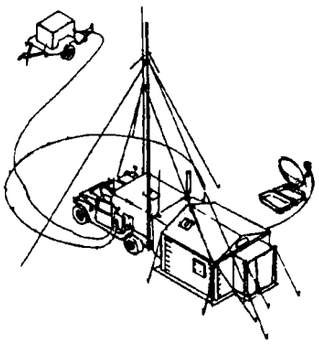
Joint STARS Common Ground Station (CGS)

FUNCTION: MTI, FTI, SAR imagery; supports situation development, battle mgt, targeting, force protection, limited BDA/TDA, operations planning; includes SATCOM & CTT communications

PRIME MOVER: LT - 2xHMMWV

UNIT AND QTY: 5 to 7- DIV; 5 to 7- Corps; 1- ACR; 1- SEP BDE; 1 to 5 EAC

INTEL APPLICATION: IMINT/SIGINT/INTEL/ ARTY/AVN SUPPORT



Integrated Meteorological System (IMETS)

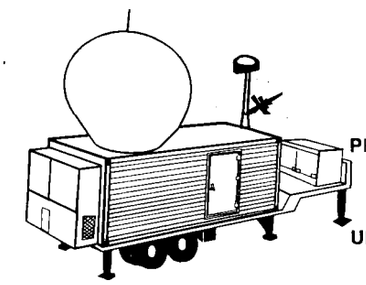
FUNCTION: Receives, processes & disseminates weather data.

PRIME MOVER: Heavy HMMWV mounted

UNIT AND QTY: DIV, Corps, EAC, SEP BDE, ACR, AVN BDE, other task organized contingencies

INTEL APPLICATION: Intelligence Support

Advanced Electronic Processing and Dissemination System (AEPDS)



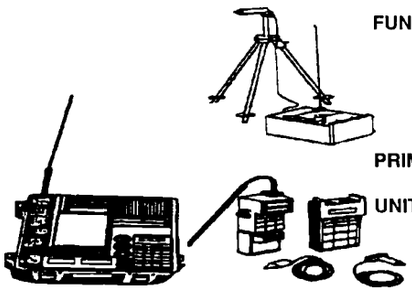
FUNCTION: Mobile, air & ground transportable comm system; receives, processes & exploits SIGINT data from multiple national, theater & organic ELINT/ COMINT systems. Combines functions of EPDS & ETUT into a single downsized system

PRIME MOVER: 30 ft van pulled by a 3-axle 10-ton tractor air deployable on C-130 or larger aircraft

UNIT AND QTV: 1- Corps (rear) 1- Select MI Bde (EAC)

INTEL APPLICATION: SIGINT

Improved Remotely Monitored Battlefield Sensor System (IREMBASS)



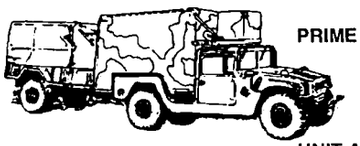
FUNCTION: Unattended ground sensor (seismic/ acoustic, magnetic, infrared, meteorological) that detects, classifies & determines direction of movement

PRIME MOVER: Manpacked and vehicle

UNIT AND QTY: LT DIV - 5 (GS Plt, I&S Co, MI Bn); ASSLT DIV - 5 (GS Plt, I&S Co, MI Bn); ABN DIV - 5 (GS Plt, MI Co (Fwd Spt), MI Bn)

INTEL APPLICATION: MASINT

Mobile Integrated Tactical Terminal (MITT)



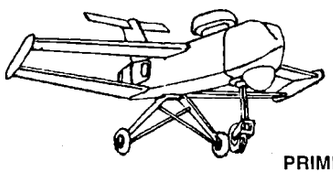
FUNCTION: Replaces THMT & FAST-I in force structure; compatible w/TROJAN, MSE, TIBS, DIN/DSSCS, STU III, TENCAP; TRAP/TADIXS-B, UHF SATCOM, S-BAND w/ROTERM/ CHARIOT

PRIME MOVER: Mobile, ground, air transportable (heavy duty HMMWV, cargo HMMWV, generator trailer, C-130, CH-47)

UNIT AND QTY: DIV and Corps ACE - 1

INTEL APPLICATION: SIGINT/IMINT

Tactical Unmanned Aerial Vehicle (TUAV) - OUTRIDER



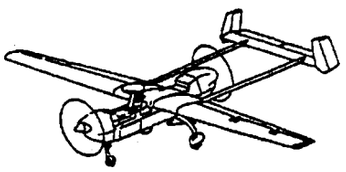
FUNCTION: Operates fwd of FLOT, in all conditions; provides NRT intel, recon, battlefield survl, color E-O camera, FLIR, plug-in optronic payload; future payloads: MTI, SAR, comm/ noncomm DF, intercept, jamming; MET

PRIME MOVER: C-130 or larger, roll-on/roll-off; ground equipment mounted on HMMWVs

UNIT AND QTY: 3 - HVY/AASLT DIV; 5 - LT DIV; 3 - ABN DIV; 3 - ACR; 5 - LT ACR; 1 - SEP BDE

INTEL APPLICATION: IMINT/SIGINT/PSYOP

Unmanned Aerial Vehicle-Short Range (UAV-SR) HUNTER



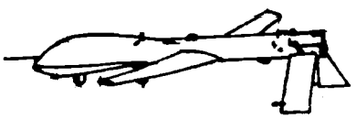
FUNCTION: Operates fwd of FLOT, in all conditions; provides NRT intel, recon, battlefield survl, color CCD, TA, BDA, recon, battlefield survl, E-O/FLIR, UAV data relay; future payloads: MTI, SAR, MET, ES, EA, mine detection, PSYOP, SIGINT, NBC recon

PRIME MOVER: NA

UNIT AND QTY: **Not fielded. For training use only**

INTEL APPLICATION: IMINT/SIGINT/PSYOP

Unmanned Aerial Vehicle (UAV)-Endurance PREDATOR



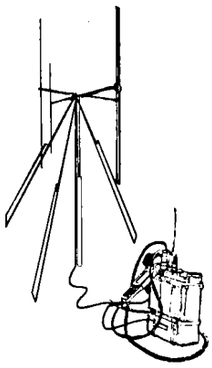
FUNCTION: Operates as stand-off system in all conditions, behind friendly lines; can penetrate into enemy territory; payloads: E-O/FLIR, MTI/SAR, SIGINT, MET, PSYOP, NBC recon, comm/data relay

PRIME MOVER: 2 C-141s or multiple C-130s

UNIT AND QTY: USAF Asset - Deployed in support of Joint Operations

INTEL APPLICATION: IMINT/SIGINT/PSYOP

Lightweight Man-Transportable Radio Direction Finding System (LMRDFS) AN/PRD-12



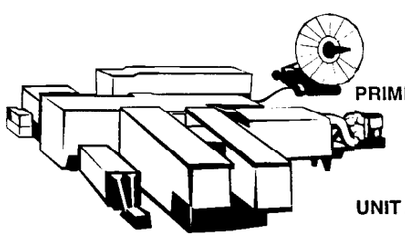
FUNCTION: Lightweight manportable comm intercept/DF system; on emitter location missions, works w/TEAMMATE; ideal in LT, ABN, AASLT, SOF opns; rapid relocation; optimizes collection in fwd AO; CNR for external comm

PRIME MOVER: Manpacked; 60 lbs, carried by 2 soldiers

UNIT AND QTY: 1 - LT ABN; 3 - HVY/AASLT DIV; 3 - ACR; 1 - SEP BDE; 7 - SOF BN; 10 - SOF SA

INTEL APPLICATION: COMINT

Modernized Imagery Exploitation System (MIES)



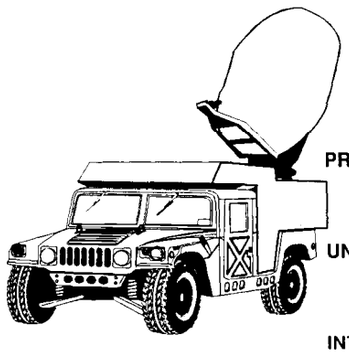
FUNCTION: NRT IMINT; provides exploitation/exploitation mgt, receipt, reporting, SID, archive of imagery & reports; replaces IPDS

PRIME MOVER: 40 ft hardcopy/softcopy exploitation van; 35 ft SATCOM van; 35 ft receive location van; air deployable, C-141, C-5

UNIT AND QTY: Selected MI Bde

INTEL APPLICATION: IMINT

TROJAN SPIRIT (AN/TSQ-190V)



FUNCTION: Satellite terminal; intel processing/dissem, secure voice, data, GPS, FAX, LAN wkstns, video, SID; receive, display, transmit digital imagery, weather/terrain prods among CONUS/OCONUS & deployed

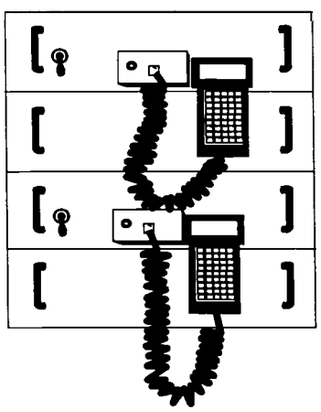
PRIME MOVER: Mounts on 2 heavy variant HMMWVs; tactical SATCOM trailer

UNIT AND QTY: Connectivity: Ft Belvoir TROJAN switching center for worldwide deployment

INTEL APPLICATION: IMINT/SIGINT/CI/ HUMINT/Intelligence Support

---

Synthetic UHF Computer-Controlled Equipment Subsystem (SUCCESS) UHF Radio



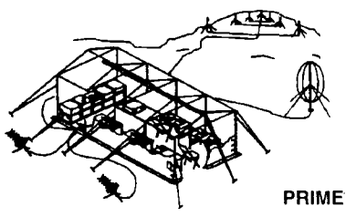
FUNCTION: Auto microprocessor UHF band radio; used w/TENCAP; simultaneous comm when stacked; 2 XMIT/6 RCV channels; SATCOM, point-to-point, TADIXS-B, direct data downlinks; comm w/abn, terrestrial & satellite systems; contains TRE processor

PRIME MOVER: Designed for ground/mobile sheltered environments

UNIT AND QTY: Demand assigned multiple access

INTEL APPLICATION: Intelligence Support

Enhanced TRACKWOLF (AN/TSQ-199)



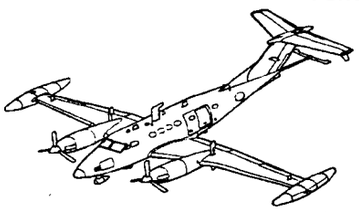
FUNCTION: Targets HF jammers/emitters; 3 netted or stand-alone stations; produces COMINT, TACREPs; spts EAC w/organic long-distance comm resources; open architecture; scaleable tier I-III; external comm via SINCGARS LPI VHF radio, DIN, DSSCS, TROJAN SPIRIT II, SSP-SIGINT, CROSSHAIR, UHF MIL SATCOM (DF Flashnet)

PRIME MOVER: NA

UNIT AND QTY: Special missions at EAC

INTEL APPLICATION: COMINT

Guardrail Common Sensor (GRCS)



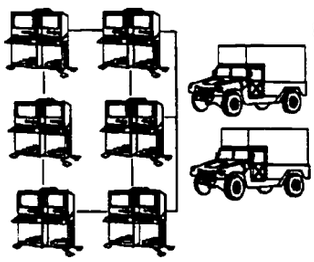
FUNCTION: Collects, identifies, classifies, locates radio signals; provides NRT reporting; gathers LOB & TDOA data; ARF relays platforms btwn IPF & cmds; incorp CHAALS; interfaces w/fixed locations & tactical users; future; expanded coll, LPI capability, embedded trng, 3-channel CTT, retrofit, and auto reporting

PRIME MOVER: Self-deployable; 4 - IPF vans; 3 - IDL trackers

UNIT AND QTY: 1 - Corps AEB

INTEL APPLICATION: ELINT/COMINT

All-Source Analysis System (ASAS)



FUNCTION: Provides auto intel, info & interface data handling for cdrs & ATCCS/ FLCS users; includes IEW sensors, preprocessors, ASAS & FLCS, ABCS HW/SW & info mgt; RWS operates outside ACE

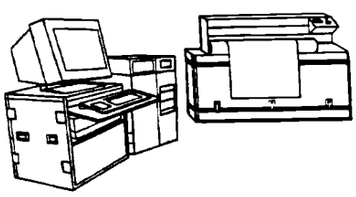
PRIME MOVER: CUCV/HMMWV 5-ton

UNIT AND QTY: 1 ACE set - EAC, Corps, DIV, Sep Bde, ACR; 1 ASAS-RWS at each Bn, Bde & required collateral locations EAC-DIV

INTEL APPLICATION: COMINT/ELINT/IMINT/ CI/HUMINT

Digital Topographic Support System Multi-Spectral Image Processor (DTSS/MSIP)

FUNCTION: Automates terrain TM; produces terrain anal prod; improves response time for IPB; collocated w/ASAS; msg traffic thru MSE; generates/updates multi-spectral imagery; contains 3-D visualization, scanning, map-sizing printer

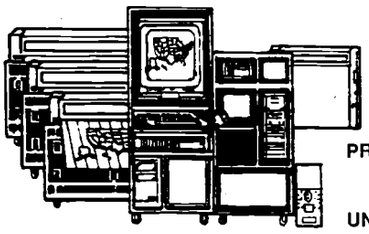


PRIME MOVER: NA

UNIT AND QTY: 1 DIV Terrain TM; 2 - EAC/Corps Terrain TM

INTEL APPLICATION: IMINT/Intelligence Support

Digital Topographic Support System Quick Response Multicolor Printer (DTSS/QRMP)



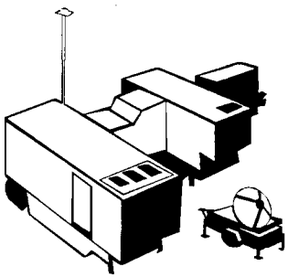
FUNCTION: Automates terrain TM; produces terrain anal prod; improves response time for IPB; collocated w/ASAS; msg traffic thru MSE; provides digital data/terrain anal from battlefield in hard/soft copy

PRIME MOVER: Tactically mobile; 2 LMS-788/gs shelters; 2 HMMWV-H

UNIT AND QTY: 1 DIV Terrain TM; 2 - EAC/Corp Terrain TM

INTEL APPLICATION: IMINT/Intelligence Support

Enhanced Tactical Radar Correlator (ETRAC)



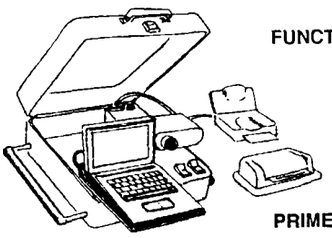
FUNCTION: Advanced mobile SAR processor; receives data from ASAR-2 via U2-R; converts radar to imagery; limited organic exploit for stand-alone opns; includes SUCCESS radio, TENCAP CSP; STU-III, DSVT

PRIME MOVER: Air deployable via C-130, C-141, C-5

UNIT AND QTY: XVIII ABN Corps and V Corps

INTEL APPLICATION: IMINT

CI/HUMINT Automation Tool Set (CHATS)



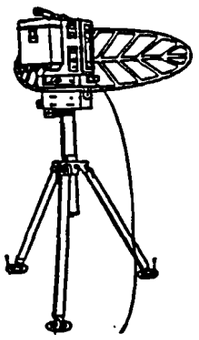
FUNCTION: Provides direct access into CI/HUMINT collateral LAN; uses INMARSAT, TROJAN SPIRIT, SINCGARS, MSE, DSN & phone lines; 2-way data comm; secure FAX; future: GPS, cellular comm, power mgt

PRIME MOVER: 2-manportable cases

UNIT AND QTY: 66th MI Group, Augsburg, GE

INTEL APPLICATION: CI/HUMINT

AN/PPS-5B



FUNCTION: Moving Target Indicators
Range:
6 km-Personnel
10 km-Vehicle

PRIME MOVER: Manpacked and vehicle

UNIT AND QUANTITY: HVY DIV: 12 systems
4/GSR Squad (3)
Survl Plt, I&S Co., MI Bn

AN/PPS-15A

FUNCTION: Moving Target Indicators
Range:
1.5 km-Personnel
3.0 km-Vehicle

PRIME MOVER: Manpacked and vehicle

UNIT AND QUANTITY: LT DIV: 12 systems
3/GSR Squad (4)
Survl Plt, I&S Co., MI Bn

ASSAULT DIV; 8 systems
3/GSR Squad (3)
Survl Plt, I&S Co., MI Bn

ABN DIV: 9 systems
3/I&S Plt (3)
MI Co., (Fwd Spt), MI Bn

APPENDIX H

MILITARY INTELLIGENCE UNITS AND CAPABILITIES

This appendix shows the structure of the MI Battalion (Heavy Division), the MI Battalion (Light Divisions, Airborne, Air Assault), and the Corps MI Brigade. The MI unit structures constitute approved MI force design.

DIVISION MI BATTALION

The MI Battalion (Heavy Division) (Figure H-1) provides dedicated IEW support to the heavy division. It responds to missions assigned by the commander and staff. (MI battalion IEW assets are shown in Appendix G.)

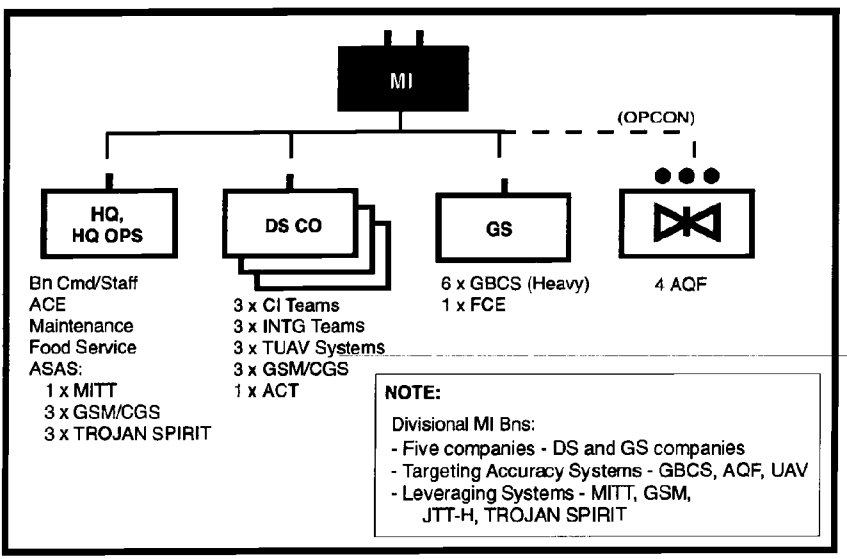


Figure H-1. MI Battalion (Heavy Division).

LIGHT, AIRBORNE, AND AIR ASSAULT DIVISION

The MI Battalion is organized as shown in Figure H-2.

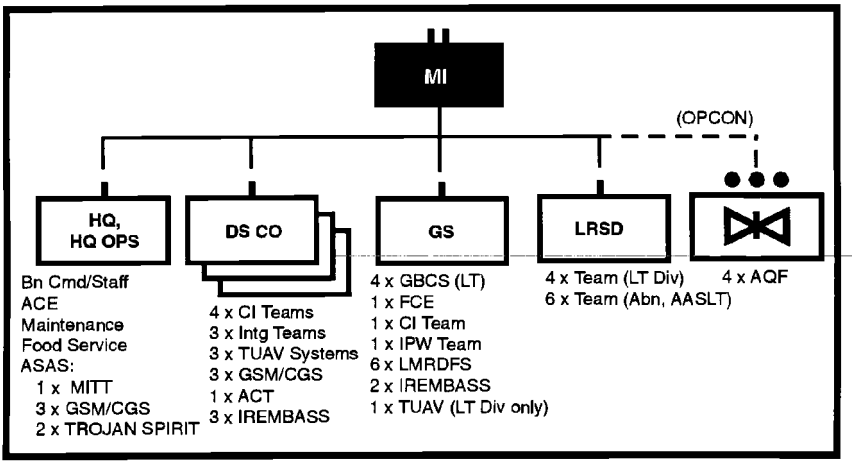

Figure H-2. MI Battalion (Light, Airborne, Air Assault Division).

CORPS MI BRIGADE:

The Corps MI Brigade (Figure H-3) provides dedicated IEW support to the Corps and its subordinate units.

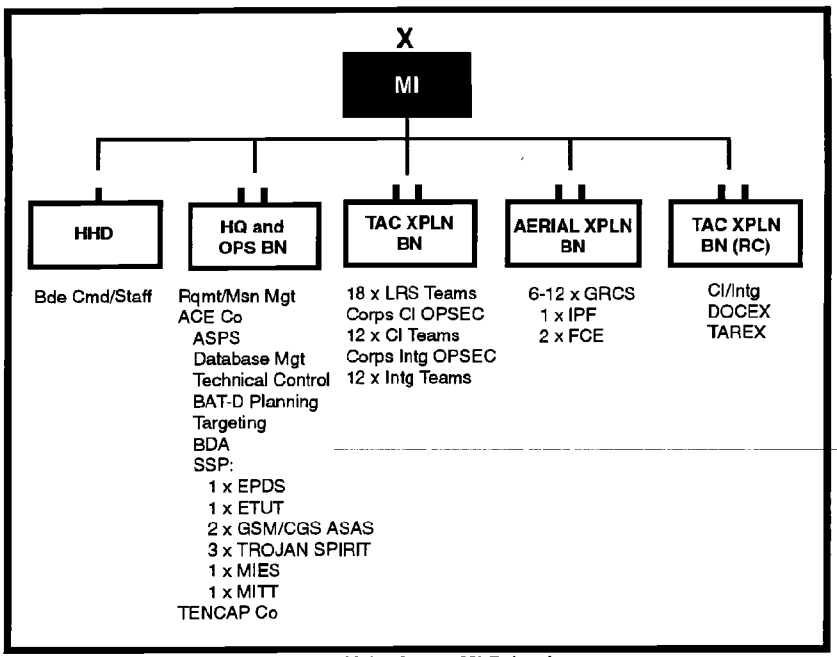

Figure H-3. Corps MI Brigade.

Figures H-4 and H-5 show the organizations of the MI Detachment, Support Company, Special Forces Group and the Special Forces Battalion, respectively.

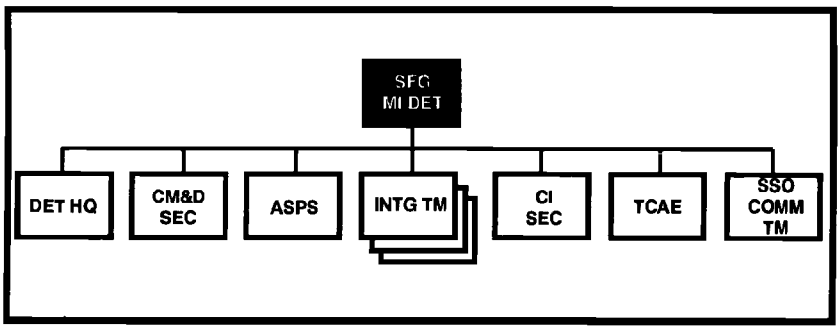

Figure H-4. Organization, MI Detachment, Spt Co, SFG.

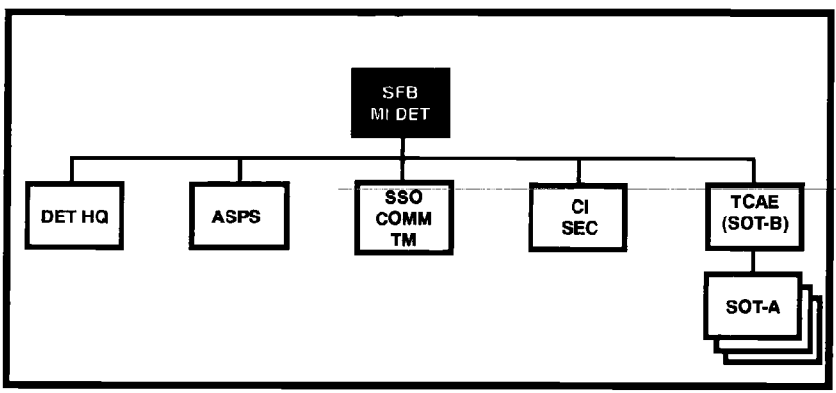

Figure H-5. Organization, MI Detachment, Spt Co, SFB.

APPENDIX I

INTELLIGENCE TRANSITION CHECKLIST

This checklist provides for transition of intelligence responsibility for an area between units. Status of all items listed must be thoroughly coordinated between the transitioning S2s to ensure an effective hand-off of responsibility.

INTELLIGENCE TRANSITION CHECKLIST

_____ CURRENT SITUATION.

_____ Threat disposition:

_____ Maneuver.
_____ Artillery.
_____ Counter-Air.
_____ Intelligence.
_____ Mobility-Countermobility-Survivability.
_____ Logistics.
_____ C^3.
_____ Deception.

_____ Threat strength:

_____ Percentage strength of units.
_____ BDA.

_____ Personnel.
_____ Equipment.
_____ Weapons.
_____ Logistics.

_____ Threat vulnerabilities.
_____ Threat capabilities.
_____ Probable COA.

_____ FRIENDLY INTELLIGENCE SITUATION.

_____ Collection plan.

_____ IMINT.
- _____ Required coverage.
- _____ Focus (CCIRs).

_____ SIGINT.
- _____ Required coverage.
- _____ Focus (EEFI/PIR).

_____ HUMINT.
- _____ NAIs.
- _____ Surveillance.
- _____ CI/IPW.
- _____ DOCEX.
- _____ Focus (RFI/PIR).

_____ Collection asset status.
- _____ Assets.
- _____ Asset schedule - previous 24 hours next 24 hours.

_____ POCs.
_____ Downlinks and COMINT.
_____ Reporting times (as of time to report and due times).
_____ COS/DEA/DOS.

_____ Lists of stay-behind elements.
- _____ Intelligence assets.
- _____ Communications architecture and frequencies.
- _____ CIA.
- _____ DIA national MIST.
- _____ JCMEC and FMIB.

_____ SIGINT.
- _____ Technical data (adds, changes, deletes).
- _____ MCSF.

_____ EPW.
- _____ Numbers, locations, Category A, SOFA.
- _____ Handover to JTF or ARFOR.
- _____ HN handover.

_____ HN Intelligence/security.
- _____ Support, assets, communications.
- _____ POCs and LNOs.

_____ KEY TERRAIN.

_____ MAP UPDATES AND CORRECTIONS.

_____ DETAINABLE, OF INTEREST, AND PROTECTABLE LISTS.

_____ INTELLIGENCE COLLECTION PLAN.

_____ COORDINATION FOR STAY-BEHIND PERSONNEL.

_____ COVER, SECURITY, OPSEC STATUS, AND PLAN.

_____ LIST OF STAY-BEHIND PRODUCTS:

_____ Intelligence map with current situation and sources.

_____ All-source intelligence support and sources.

_____ Imagery products and sources.

_____ Current weather forecast and on-hand weather, light data, and sources.

_____ Historical documents, locations, and sources.

_____ ENCLOSURES:

_____ List of threat, strengths, capabilities, COAs, weaknesses and vulnerabilities, and effects of friendly action.
_____ Threat situation overlays.
_____ Troop list of friendly collectors.
_____ Friendly collector location overlays.
_____ Intelligence communications net diagrams and POC list.
_____ Key terrain overlays.
_____ Map updates and corrections (may be overlay).
_____ Detainable, of interest, and protectable lists.
_____ Intelligence collection plan.

APPENDIX J

INTELLIGENCE REFERENCE LIST

NOTE: This list is not all inclusive. Include the series of field manuals for your particular unit; for example, FM 44-series for Air Defense. Make sure the publications clerk is aware of your requirements. Refer also to the References section in this manual.

AR 190-11	Physical Security of Arms, Ammunition and Explosive
AR 190-13	The Army Physical Security Program
AR 190-14	Carrying of Firearms and Use of Force for Law Enforcement and Security Duties
AR 190-51	Security of Unclassified Army Property
AR 525-13	The Army Combating Terrorism Program
AR 380-5	Department of the Army Information Security Program
AR 380-10	Technology Transfer, Disclosure of Information and Contacts with Foreign Representatives
AR 380-19	Information Systems Security
AR 380-67	The Department of the Army Personnel Security Program
AR 381-1	Security Controls on Dissemination of Intelligence Information

NOTE: DOCTRINE WRITTEN PRIOR TO 1992 IS BEING REVISED. UPDATE YOUR REFERENCE LIST AS NEW DOCTRINE IS PUBLISHED.

APPENDIX K

WEATHER ELEMENTS AND SUPPORT

A working knowledge of weather elements is essential to provide your commander with a complete picture of potential adverse weather effects on the battlefield.

INTERACTION OF BATTLEFIELD ENVIRONMENT ELEMENTS

Weather conditions, terrain, BIC, illumination, and background signatures are some primary conditions found in a battlefield environment (Figure K-1).

A weather element is an atmospheric variable that is measured in a weather observation. A weather parameter is derived from one or more weather elements. Example: Density altitude is a weather parameter derived from the element's barometric pressure and temperature.

Weather conditions such as wind, precipitation, and clouds can impact or can be influenced by the other conditions of the battlefield. All of these conditions are interdependent, to a certain degree, and must be considered as a whole (Figure K-2).

WEATHER EFFECTS AND TERRAIN

Terrain features affect weather elements such as visibility, temperature, humidity, precipitation, winds, clouds. The most common example of terrain affecting weather is that on the windward side of high terrain, such as mountains, the rainfall rate will be greater than on the leeward (opposite) side.

Weather conditions have a definite effect on the terrain and can enhance or limit military operations such as trafficability, water crossing (fording), and the first-round accuracy of supporting FA fires. The responsibility for determining mobility and counter-mobility is given to the terrain team at division.

ATMOSPHERIC PRESSURE: Atmospheric pressure is the pressure exerted by the atmosphere at a given point and measured by a barometer in inches of mercury (Hg) or in millibars (Mb).

Pressure Altitude: This is indicated in an altimeter when 29.92 is set in the barometric scale window. High pressure altitude is critical to the lift capability of fixed wing aircraft.

Density Altitude: This is a place in the atmosphere corresponding to a particular value of air density. High pressure is critical to helicopter operations.

CLOUDS: The amount of sky covered by clouds is usually described in eighths: Overcast (8/8ths), broken (5 to 7/8ths), or scattered (1 to 4/8ths). Cloud conditions are described by the amount of cloud cover and the height of the base of the cloud AGL. A cloud ceiling is the height of the lowest broken or overcast layer, and is expressed in feet. A higher layer of several scattered layers of clouds is designated as a cloud ceiling when the sum of the coverage of the lower layers exceeds 4/8ths.

DEW POINT TEMPERATURE: Dew point is the temperature to which the air must be cooled for the air to become saturated and allow dew, and probably fog, to form.

HUMIDITY: This is the state of the atmosphere with respect to water vapor content. It is usually expressed as:

Relative Humidity: The ratio between the air's water content and the water content of saturated air.

Absolute Humidity: The measure of the total water content in the air. It is high in the tropical ocean areas and low in the arctic.

PRECIPITATION: Precipitation is any moisture falling from a cloud in frozen or liquid form. Rain, snow, hail, drizzle, sleet, and freezing rain are common types. The intensity of precipitation is described as light, moderate, and heavy.

Light Rain: Drops are easily seen, very little spray, and puddles form slowly, and accumulation is a trace to 0.10 in/h.

Figure K-1. Common weather elements.

Moderate Rain:	Drops are not easily seen, spray noticeable, puddles form rapidly, and accumulation rates are 0.11 to 0.30 in/h.
Heavy Rain:	Drops are not seen, rain comes in sheets with heavy spray, puddles form quickly, and the rate is more than 0.30 in/h.
Light Snow:	Visibility is equal to or greater than 5/8 miles, or 1,000 meters in falling snow; and a trace to 1 in/hr accumulates.
Moderate Snow:	Visibility is 5/16 to ½ statute miles, or 500 through 900 meters in falling snow with 1 to 3 in/hr accumulation.
Heavy Snow:	In heavy snow, visibility is cut to less than 1/4 statute miles, or 400 meters, with more than accumulation of 3 in/h.

TEMPERATURE: Temperature is the value of heat or cold recorded by a thermometer normally at 6 feet AGL at the observation site. Temperatures are normally given in both Fahrenheit and Celsius values. It is sometimes referred to as the ambient air temperature.

VISIBILITY: A measurement of the horizontal distance at the surface or aloft that the unaided human eye can discern a large object or terrain feature. Visibility is reported in meters or fractions of a mile, and is reported as a prevailing value of the visibility in all directions. Thus, a visibility report of 1,600 meters may not reveal that fog is diminishing visibility to 400 meters in the northwest if the observer has good visibility in other directions. However, such an event would typically be carried in the weather observation's remarks section.

WIND SPEED AND DIRECTION: These two measure the rate of movement of the air past a given point and the direction from which the wind is blowing. A gust is a rapid fluctuation in wind speed with a variation of 10 knots or more between peak and lull. Gust spread is the instantaneous difference between a peak and a lull and is important for helicopter operations.

Figure K-1. Common weather elements (continued).

WEATHER ELEMENTS	THRESHOLD VALUES	IMPACTED SYSTEMS
VISIBILITY	1.0 km 3.0 km	•DRAGON, Machine guns. •Main gun, TOW, CAS, thermal viewers.
CLOUDS	500 ft 1,000 ft 1,500 ft 5,000 ft	•NOE operations, airborne, helicopter TA. •CAS. •COPPERHEAD engagements. •Visual reconnaissance, ADA TA.
SURFACE WIND	6 kn 13 kn 18 kn 30 kn	•Chemical. •Airborne-round parachute. •Military free fall-ram air parachutes, artillery smoke loses its effectiveness, artillery fire accuracy. •Helicopter maneuver.
TEMPERATURE	>32^{C}C < 0^{C}C	•Helicopter lift capabilities. •NVG (PVS-5).
WINDCHILL	<10^{C}C	Personnel survival.
PRECIPITATION	Moderate Freezing	•Ground maneuver, chemical, laser systems, GSR. •Ground maneuver.

Figure K-2. IPB weather overlay criteria.

BATTLEFIELD-INDUCED CONTAMINANTS

During combat operations, visibility can become severely reduced by BIC. These contaminants are either induced directly by combatants or occur as by-products from battlefield operations.

Two significant sources of battlefield contaminants are dust produced by HE artillery or mortar rounds and deliberately employed smoke. HE rounds used in a pre-attack barrage not only may kill enemy forces but also may restrict the visibility of your own troops by dust caused by the HE if you do not consider the direction of the wind. Smoke produced by smoke generators, vehicle exhaust emission

systems, smoke pots, indirect fire, and smoke rounds also produce battlefield contaminants.

Wind speed and direction are critical to maintaining an effective smoke screen. Rain can remove BIC quickly. Weather inversions over valley areas can sustain airborne contaminants for long periods.

Other sources of BIC that will lower visibility in the AO are clouds of dust from vehicle traffic or smoke from fires. These types of contaminants not only blind you but also may help your adversary in detecting troop movements and pinpointing your location.

A unique BIC affecting visibility occurs in conditions when temperatures are in the range of -30EC or -22EF or colder. When a source of moisture or water vapor is released into the cold air by internal combustion engines, artillery fires, or launched self-propelled munitions, visibility can be reduced to zero when the moisture freezes instantly and changes into ice fog.

Ice fog may restrict visibility across a whole valley and can linger for hours. Ice fog crystals permit ground objects to be seen from above while severely restricting visibility on the ground—an advantage for aerial reconnaissance.

On airfields an ice fog created by fixed-wing aircraft may cover an entire runway. Visibility can be reduced so that other aircraft cannot take off or land if the wind is calm. The ice fog also draws attention to the airfield location.

Launching missiles such as the TOW in very cold air can create an ice fog. As the TOW moves to the target, the exhaust blast exits into the air where it condenses and creates the ice fog. If the wind is calm, this fog follows the trajectory of the missile and reduces launch point visibility to such an extent that the operator loses sight of the target. Also, the launch point can be identified by threat forces from the condensation trail of the missile.

ILLUMINATION

Natural light is critical in planning operations where NVD are used or in operations timed to use only available light. Natural light values vary as a function of the position of the sun, moon, stars, and clouds. Light data are available from your SWO for any time period and place. These data are particularly important for determining first and last light, moonrise, and moonset, and are most effective for planning use of NVD.

Variables such as altitude, cloud cover, terrain-produced shadows, visibility, and direction of vehicle or aircraft movement in relation to the sun or the moon can also affect light level availability.

Artificial light is intended to increase visibility but, under certain weather conditions, this does not always occur. Example: Low cloud ceilings will limit the area covered and effective time of flares. Rain, snow, or fog can reduce flare effectiveness. However, under the right conditions, cloud cover can enhance the effects of artificial light due to cloud base reflection. Snow- or sand-covered terrain also reflect both natural and artificial light.

BACKGROUND SIGNATURES

Temperature, wind, and precipitation have a major influence on your ability to pick out a target from the background in the infrared spectrum. They also affect seismic (sound and acoustic) signatures. Detection of objects in the infrared spectrum depends on a temperature contrast between the object and its surrounding environment. This difference is known as the background signature.

Snow, rain, and wind influence the background signature because they can change the surface temperature of objects. These elements lower object temperatures and thus reduce the differential between a target and its background.

A heavy layer of snow produces a washout during any part of the day since it causes both the object and the background to exhibit the same temperature.

Precipitation also degrades seismic sensors through the introduction of background noise (rain), while a snow-covered surface will dampen sound and the movement of troops.

SEVERE OR HAZARDOUS WEATHER

In addition to a continuous need for forecast updates, you need non-forecasted or unanticipated severe or hazardous weather warnings. WETMs normally issue severe weather warnings and advisories. Check for the values at which each weather element becomes known as severe. You will be concerned with conditions such as—

- Tornadoes.
- Thunderstorms producing winds in excess of 45 knots and hail greater than 3/4 of an inch.
- Hurricanes and typhoons.
- Precipitation (rain or snow) when X inches fall in Y hours.
- Surface winds in excess of X knots.
- Maximum and minimum temperatures; when a forecast value misses the actual temperature by X degrees.

You want to know that an earlier forecast for light snow was amended to a forecast of a 16-inch accumulation within the next 12 hours. We cannot over emphasize that you need to work with your next higher HQ S2/G2 and the SWO so that your needs are realistically stated and can be supported. All of your weather support needs should be reviewed every 6 months in garrison and as required in the field.

LIGHT DATA

Another weather-related element that your commander needs is light data. NVD and NVG have made many night operations feasible. Your SWO provides official times for sunrise and sunset, BMCT and EECT, BMNT and EENT, length of absolute darkness, moonrise, moonset, lunar phase in percent, and time periods for using NVD and NVG. Light data to support NVD is needed because there are times when there is not enough moon or starlight to use them.

Civil twilight is sufficient for conduct of combat operations while nautical twilight permits most ground movements without difficulty. Nautical twilight allows a general visibility of up to 400 meters (1,320 ft) and lets you distinguish silhouettes from the background.

The actual duration of light varies with latitude and time of year. For example, in the vicinity of 35 to 40 degrees north latitude, civil twilight generally occurs 30 to 45 minutes before sunrise and after sunset. In the tropics, twilight is shorter.

Once light requirements are determined, relay them to your next higher S2 and SWO. This information is important for your commander because he needs to know not only when he can begin friendly military operations (day or night) but also when threat operations could begin.

OTHER CONSIDERATIONS

Although HF radio wave propagation forecasts are not normally available to the SWO, he can make arrangements before he deploys to receive these forecasts. When available, they should be given to every signal and intelligence organization. The SIGO should know that when HF is not effective, it may be because of solar activity rather than enemy jamming.

The USAF Global Weather Central can routinely provide solar forecast products to the SWO even in the field. Other data, such as tidal information and sea state conditions, can be obtained from the SWO but are normally provided only to specific Army units upon request.

RECEIPT OF FORECASTS

Every tactical echelon should receive the weather forecast prepared and briefed to the commander at the next higher echelon. With no SWO at a maneuver brigade, you receive both the forecast briefed at division covering the division AO and the forecast made by the division SWO specifically for your brigade. Each forecast message received should be worked by you to discover the direct weather impacts on your unit.

A commander wants the weather forecast. He also needs the effects and impacts of the forecasted weather interpreted for his specific operations, systems, and personnel. Schedule your forecasts so they arrive in time for you to prepare your commander's briefing.

HOW G2 OR S2 RECEIVE WEATHER SUPPORT

It is your responsibility to provide weather and weather effects information to your commander and supported or subordinate units. Methods may vary among units and echelons. At higher echelons, the SWO has primary responsibility for providing weather support. There, the G2 simply contacts the SWO, states requirements, and receives the needed weather support.

If you have no SWO, you must pass the request up the chain of command to a level where one is assigned. Once your requirements have been validated, weather support products flow back over the same path. In addition to weather forecast products, the SWO can provide specialized weather effects products. You must provide the threshold values used in developing these products.

You alert your commander and staff about the adverse impact of the forecasted weather. You prepare two simple charts to use during your commander's stand-up briefing. You can post these charts in the CP for reference.

Update the charts when a new forecast is issued by the WETM. Methods used in briefing your commander during the morning and evening briefings may vary greatly among commands. The formats below are a guide and should be modified to suit your situation.

The first chart (Figure K-3) illustrates how the weather elements and parameters contained in the forecast might be displayed on the board. Blown up to poster size and covered with acetate, this chart can be updated easily.

WEATHER FORECAST
VALID FOR 121200Z to 131200Z

LOCATION: PUNGSAN

24-HOUR FORECAST:

SKIES:	CLEAR MORNING AND NIGHT, PARTLY CLOUDY IN THE AFTERNOON, BASES 3,000 FEET.
VISIBILITY:	UNLIMITED, OCCASIONALLY 1 TO 2 MILES IN BLOWING SNOW DURING AFTERNOON.
WINDS:	NORTH TO NORTHWEST, 10 TO 15 KNOTS, OCCASIONAL GUSTS TO 25 KNOTS IN AFTERNOON.
TEMPERATURES:	MAX: 10EF MIN: -20EF

72-HOUR OUTLOOK:

CLOUDY SKIES, SNOW FLURRIES DURING AFTERNOON HOURS LOWERING VISIBILITY TO 2 TO 4 MILES.

TEMPERATURES: MAX: 20EF MIN: -5EF

LIGHT DATA:

BMNT: 1247Z MOONRISE: 1924Z
BMCT: 2221Z MOONSET: 0819Z
SUNRISE: 2251Z
SUNSET: 0820Z NVG USE:
EECT: 0851Z

Figure K-3. Example of a weather forecast chart.

Figure K-4 shows color codes as one way to display potential weather impacts on operations, systems, and personnel in your unit. Another way would be to write the words "moderate" and "severe" in those blocks affected. Do not list all the equipment or systems, but have the list available to answer questions posed by the commander or staff. Stress those critical systems during the verbal portion of your briefing.

If the weather conditions change significantly during the period covered by the SWO's forecast, then an updated impact chart will have to be prepared. Because a brigade or battalion's AI is small, the SWO's forecast is likely to be uniform across the AI.

WEATHER IMPACT CHART
PERIOD 121200Z to 131200Z

IMPACTED ITEMS	CLOUDS	PRECIPI-TATION	WIND	VISIBILITY	TEMPER-ATURE
NBC DEFENSE	GREEN	GREEN	GREEN	GREEN	RED
NIGHT VISION DEVICES	GREEN	GREEN	GREEN	AMBER EXCEPT 07 /0 05Z	AMBER
CSS	GREEN	AMBER	AMBER	AMBER	AMBER

PERSONNEL	GREEN	GREEN	RED	GREEN	RED
THREAT	GREEN	GREEN	GREEN	AMBER	GREEN

GREEN No impact
AMBER Moderate impact (Normal effectiveness reduced 25 to 75%)
RED Severe impact (Normal effectiveness reduced to 0 to 25%)

Figure K-4. Example of a weather impacts display chart.

CRITICAL WEATHER FACTORS

Figure K-5 shows major critical weather factors that can enhance or degrade combat operations, systems, and personnel.

LOW VISIBILITY:	Low visibility (less than 3 km). • Can be beneficial to threat and friendly forces. • Conceals the center of gravity and maneuver of offensive forces. • Increases possibility of achieving surprise. • Disadvantages. –Hinders $C^{2.}$ –Reduces effectiveness of R&S and TA, especially during the defense.
SURFACE WINDS:	• Strong winds can reduce effectiveness of downwind forces by blowing dust, smoke, sand, rain, or snow on them. • Upwind force generally has better visibility and can advance faster and easier. • Strong winds limit airborne and aviation (primarily helicopters) operations. • Winds in excess of 35 knots can— –Cause personal injury. –Damage materiel and structures. –Create false radar returns. –Reduce visibility because of blowing sand, dust, and other battlefield debris.
PRECIPITATION:	• Affects trafficability, visibility, personnel effectiveness, and a wide variety of tracked and wheeled military equipment. • Heavy rains can make some unsurfaced, low-lying, and off-road areas impassable.

Figure K-5. Critical weather factors.

	• Both rain and snow can drastically reduce personnel effectiveness by limiting visibility, causing discomfort, increasing fatigue, and creating other physical and psychological problems.
CLOUD COVER:	• The type and amount of cloud cover and the altitude of cloud bases and tops influence aviation operations. • CAS employing fixed-wing aircraft would like a ceiling of at least 2,500 feet (762 m), but can be employed with ceilings as low as 500 feet. • Threat CAS rotary-wing aircraft and aerial resupply missions require a minimum ceiling of 300 feet (100 m). • Affects ground operations by reducing illumination and visibility or by enhancing effects of artificial light.
TEMPERATURE AND HUMIDITY:	• Have a direct impact on personnel and vehicle performance. • Excessively high temperatures cause heat-related injuries to personnel and vehicle engine wear that leads to equipment failure. • Very low temperatures increase cold weather injuries, cause damage to vehicle cooling systems and engines, decrease the effectiveness of vehicle lubrication, and create excessive logistics requirements.

Figure K-5. Critical weather factors (continued).

WEATHER EFFECTS ON THREAT SYSTEMS

MILITARY ASPECTS OF WEATHER:

US Forces must be prepared to fight in a variety of climatic conditions on short notice. Key to accomplishing our missions under any circumstances is

understanding how weather affects both friendly and threat forces and their operations, systems, and personnel.

Current weather conditions and weather forecasts for the AO and AI are analyzed to determine the effects on friendly and enemy operations. This is significant when threat forces have the capability to employ NBC weapon systems.

THREAT EQUIPMENT:

Some of the major arms merchants today are the former Soviet Union, Sweden, Brazil, Britain, Germany, France, Italy, and the United States. However, the major arms purchasers continue to be the underdeveloped or Third-World countries in the Middle East, Latin America, and Asia.

The types of threat equipment we may encounter on future battlefields will vary from artillery and mortars produced during World War II to the Austrian-produced GHN-45, a 155-mm towed gun with a range of 39,600 meters (using ERFB-BB technology). Almost all the Third-World countries have bought or made their own versions of Soviet-produced tanks, APCs, artillery, AAA, and assorted SAM and SSM systems. Tables K-1, K-2, and K-3 list the weather effects from cloud ceilings, reduced visibility, and precipitation, respectively.

Not listed are a large variety of threat combat equipment (wheeled and tracked) affected by moderate or heavy rain and snow.			

WEATHER AND ENVIRONMENTAL ELEMENTS AND PARAMETERS IMPACTING ARMY SYSTEMS AND OPERATIONS:

Table K-4 is compiled from a study conducted by the US Army Intelligence School as part of the IEWMAA. Each TRADOC branch was asked to survey the impact of weather and environmental elements on their operations, systems, and personnel and rate them as either **essential (E)** or **desired (D)**. Also included are other Army agencies' requirements.

- **E**—Some positive action had to be taken by the user based on severe current or forecasted weather conditions.

- **D**—Some impact, but the degree of impact is uncertain or not mission-threatening.

For each element or parameter listed, at least one responder identified it as essential for one or more of their operations, systems, or personnel.

Some data elements and parameters are known to have an impact, but exact critical thresholds have not been determined. Others cannot be measured or sensed with present technology. But identifying these data elements or parameters now allows for further research in how to collect the raw data (where applicable), determine the frequency of collection, establish data accuracy, and learn other supporting information.

As users and planners continue to learn more about weather and environmental impacts, the misconception that there is a hypothetical Army "all-weather" system or operation fades.

Table K-5 shows windchill factors.

		LITTLE DANGER FOR PROPERLY CLOTHED PERSONS		**CONSIDERABLE DANGER**			**VERY GREAT DANGER**					
DANGER FROM FREEZING OF EXPOSED FLESH												

HOT WEATHER ENVIRONMENT:

In hot weather, important factors are temperature and relative humidity. Primary concerns are physical exhaustion and dehydration. You must consider both because a common work task will take longer and additional water may have to be transported during hot weather. The following are specific concerns:

Water Adequacy. Water supplies and the enforcement of its intake before, during, and after physical activity is critical for survival.

Workload Correlation. Adapt workload or training activities to environmental heat stress conditions.

Rest Periods. Provide adequate break time for physically active personnel in a hot environment.

Chilled Drinking Water. Soldiers will often reject warm drinking water even when they are significantly dehydrated.

Physical Activity. Soldiers' introduction to physical exertion in a hot climate upon arriving from a temperate climate should be as gradual as circumstances allow. They will need 1 to 2 weeks' time to physiologically adjust to the new climate. Lighten physical activity during this period to ensure optimum performance.

Salt. Sodium intake must be maintained in hot weather. Two good meals a day normally provide enough salt for most soldiers.

Humidity. A low WBGT index (e.g., in the morning) may not be a totally safe indicator if the humidity is high. High humidity retards cooling by evaporation of sweat and decreases the urge to drink sufficient water.

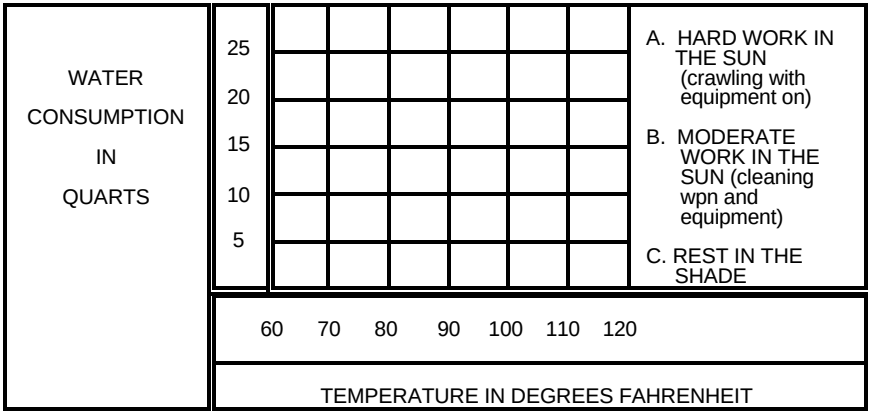
Water Spray. A water mist will cool a person. But it should never be substituted for adequate consumption of water before, during, and after strenuous activities in the heat.

The SWO can provide temperature measurement, forecast, and relative humidity forecasts from the following tables. If you need air temperature values measured at your particular location, use the thermometer included in the FALOP BWK.

HOT WEATHER WATER REQUIREMENTS:

Table K-6 shows the water needs for soldiers at 3 activity levels over an 8-hour work period. To determine soldiers' average water needs, you have to know the air temperature and decide the level of activity the troops will be doing. Example: If a soldier is doing 8 hours of hard work in the sun (curve C) when the average temperature for the day is 100EF, his water requirements for the day will be around 15 quarts. This amount of water can be converted into extra weight the soldier must carry. One quart is equal to 2 pounds, so the 15 quarts of water would weigh 30 pounds.

Table K-6. Daily water consumption requirement s for three levels of activity.



HOT WEATHER WORK TIME LIMITS:

Table K-7 shows the time limits during which work can be performed safely in hot weather. In computing the time limits, consider both air temperature and relative humidity. The values are based on a sitting soldier in BDUs doing light work. Do not consider these tables as absolute limits—especially since light, moderate, or heavy work are difficult to quantify. Table K-8 indicates work time in hot weather based on the WBGT index. Table K-9 shows conversion factors.

Table K-7. Work time in hot weather operations.

TEMPERATURE		RELATIVE HUMIDITY (%)					
(EC)	(EF)	10	30	50	70	90	100
60	140	1 HR	.25 HR				
54	130	2 HR	.5 HR	.25 HR	NO WORK RECOMMENDED

32	90	WITH PRECAUTIONS			12 HR	6 HR	4 HR

Table K-8. WBGT index (light work).

HEAT CONDITION/ CATEGORY *	WBGT(^{o}F)	WATER INTAKE QUARTS/HOUR	WORK/REST CYCLE (MINUTES)
1	78.0 to 81.9	AT LEAST ½	CONTINUOUS
2	82.0 to 84.9	AT LEAST 1.2	50/10
3	85.0 to 87.9	AT LEAST 1	45/15
4	88.0 to 89.9	AT LEAST 1-½	30/30
5 **	90.0 and ABOVE	MORE THAN 2	20/40

* MOPP gear or body armor adds at least 10 ^{o}F to the WBGT index.
** Suspend PT and strenuous activity. If operational (non-training) mission requires strenuous activity, enforce water intake to minimize expected heat injuries.

Table K-9. Conversion factors.

TO CONVERT:	TO:	USE:
	TEMPERATURE	
Degrees F	Degrees C	$^0C = 5/9\ ^0F - 32)$
Degrees C	Degrees F	$^0F = (9/5\ ^0C) + 32$
	DISTANCE	
Kilometers	Miles	0.62
Kilometers	Nautical Miles	0.54
Kilometers	Feet	3,280.80
Miles	Kilometers	1.61
Miles	Nautical Miles	0.87
Miles	Yards	1,760.00
Miles	Feet	5,280.00
Nautical Miles	Kilometers	1.85
Nautical Miles	Miles	1.15
Meters	Feet	3.28

Meters	Yards	1.094
Yards	Meters	0.9144

GLOSSARY

Section I. Acronyms and Abbreviations

A

A	as acquired (effect used in AGM)
AA	avenue of approach
AAA	air avenue of approach
AAM	air-to-air missile
AAO	Army Aviation Officer
AAR	after-action report
AASLT	air assault
ABCS	Army Battle Command System
abn	airborne
AC	Active Component
ACE	analysis and control element
ACofS	Assistant Chief of Staff
ACR	armored cavalry regiment
ACT	analysis and control team
AD	air defense
ADA	air defense artillery
ADO	air defense officer
ADP	automated data processing
AEB	aerial exploitation battalion
AEPDS	Advanced Electronic Processing and Dissemination System
AF	audio frequency
AFATDS	Advanced Field Artillery Tactical Data System
AFSO	aerial fire support observer
AGL	above ground level
AG/LT	assault gun/light tank
AGM	attack guidance matrix
AI	area of interest
ALO	air liaison officer
ALOC	administrative and logistics center
AMSS	Automatic Meteorological Sensor System
AO	area of operations
AOB	air order of battle
APC	armored personnel carrier
AQF	Advanced QUICKFIX

AR	Army Regulation
ARF	airborne relay facilities
ARFOR	Army force
ARL	airborne reconnaissance low
ARSOF	Army Special Operations Forces
arty	artillery
ASAR	Advanced Synthetic Aperture Radar
ASAS	All-Source Analysis System
ASM	air space management
ASPS	all-source production section
asst	assistant
AT	antitank
ATCCS	Army Tactical Command and Control System
ATGM	antitank guided missile
ATK	attack
ATR	automated target recognition
ATW	antitank weapon
AUTL	Army Universal Task List
auto	automated
avn	aviation
AVTR	airborne video tape recorder
AWACS	Airborne Warning and Control System

B

B	bomber
BAT-D	battlefield deception
BCTP	battle command training program
BDA	battle damage assessment
BDE	brigade
BDU	battle dress uniform
BHL	battle handover line
BIC	battle-induced contaminants
BICC	battalion information control center
BMCT	beginning of morning civil twilight
BMNT	beginning of morning nautical twilight
BMO	battalion maintenance officer
bn	battalion
BOS	battlefield operating system
BP	battle position
BWK	belt weather kit

C

C^2	command and control
C^2I	C^2 and intelligence
C^2W	command and control warfare
C^3	command, control, and communications
C^3I	C^3 and intelligence
C^4I	C^3, computers, and intelligence
C^4I^2	C^4I and information
CA	Civil Affairs/combat assessment
CALL	Center for Army Lessons Learned
CARVER	criticality, accessibility, recuperability, vulnerability, effect, and recognizability
CAS	close air support
Cas Evac	casualty evacuation
CATK	counterattack
CB	counterbattery
cbt	combat
CBU	cluster bomb unit
CCIR	commander's critical information requirements
CCM	cross-country movement
CCMEC	Combined Captured Materiel Exploitation Center
CD	counter-drug
CDMP	combat decision-making
CDR	commander
CEE	captured enemy equipment
CEM	captured enemy materiel
CFE	Conventional Forces In Europe
CFL	coordinated fire line
CFSO	Counterintelligence Force Protection Source Operations
CGS	J-STARS common ground station
CHAALS	Communication High Accuracy Airborne Location System
CHARIOT	Portable S-Band Receive/Transmit Terminal
CHATS	CI/HUMINT Automation Tool Set
chem	chemical
CI	counterintelligence
CIA	Central Intelligence Agency
CINC	commander in chief
CIP	Command Inspection Program
CIR	critical intelligence requirements
CM	collection management
cmd	command

CMEC	Captured Materiel Exploitation Center
CMISE	Corps Military Intelligence Support Element
CMO	civil-military operations
CNR	combat net radio
co	company
COA	course of action
COIN	counterinsurgency
coll	collection
COLT	combat observation lasing team
COMINT	communications intelligence
comm	communications
COMMEX	communications exercise
COMSEC	communications security
CONPLAN	contingency plan
CONUS	continental United States
coord	coordination
COP	command observation post
COR	chief of reconnaissance
COS	critical occupational speciality
CP	command post
CS	combat support
CSBM	Confidence and Security Building Measures
CSP	communications system processor
CSS	combat service support
CSR	controlled supply rate
CTC	combat training center
CTT	commander's tactical terminal
CUCV	commercial utility cargo vehicle

D

D	destroy (effect used in AGM); desirable (weather designator)
DA	Department of the Army
DDMP	deliberate decision-making process
DEA	Drug Enforcement Administration
DF	direction finding
DIA	Defense Intelligence Agency
DIN	Defense Intelligence Network
DISE	Deployable Intelligence Support Element
dissem	dissemination
div	division

DMP	decision-making process
DOCEX	document exploitation
DOD	Department of Defense
DOS	Department of State
DP	decision point
DS	direct support
DSN	Defense Secure Network
DSSCS	Defense Special Security Communications System
DST	decision support template
DSVT	digital subscriber voice terminal
DTG	date-time group
DTSS/MSIP	Digital Topographical Support System/Multi-Spectral Image Processor
DTSS/QRMP	Digital Topographical Support System/QUICK-Response Multicolor Printer
DZ	drop zone

E

E	essential (weather designator)
EA	electronic attack; engagement area (used in AGM)
EAC	echelons above corps
ECB	echelons corps and below
ECOA	enemy course of action
EECT	end of evening civil twilight
EEFI	essential elements of friendly information
EENT	end of evening nautical twilight
EFVS	electronic fighting vehicle system
e.g.	for example
ELINT	electronic intelligence
EM	electromagnetic
ENGR	engineer
E-O	electro-optical
EP	electronic protection
EPB	electronic preparation of the battlefield
EPDS	Electronic Processing and Dissemination System
EPW	enemy prisoner of war
ERFB-BB	extended-range full-bore-based bleed
ES	electronic warfare support
est	estimated
etc	and so forth
ETRAC	Enhanced Tactical Radar Correlator

ETUT	Enhanced Tactical Users Terminal
EW	electronic warfare
EWO	electronic warfare officer
EWS	early warning system
EWTL	electronic warfare target list
EXEVAL	external evaluation

F

°F	degree Fahrenheit
F	fighter (sortie category)
FA	field artillery
FAC	forward air controller
FAIO	field artillery intelligence officer
FALOP	forward area limited observation program
FARP	forward arming and refueling point
FAST	Forward Area Support Terminal
FAST-I	Forward Area Support Terminal-Improved
FAX	facsimile
FBIS	Foreign Broadcast Information Service
FCE	fire control element
FDA	functional damage assessment
FDC	fire direction center
FDO	fire direction officer
FEBA	forward edge of the battle area
FFIR	friendly forces information requirements
FISTV	first support team vehicle
FLCS	Force Level Control System
FLIR	forward-looking infrared
FLOT	forward line of own troops
flt	flight
FM	field manual
FMC	fully mission capable
FMIB	Foreign Materiel Intelligence Battalion
FO	forward observer
FofF	field of fire
FRAGO	fragmentary order
FS	fire support
FSB	forward support battalion
FSC	fire support center
FSCL	fire support coordination line
FSCM	fire support coordinating measure

FSCOORD	fire support coordinator
FSE	fire support element
FSO	fire support officer
FSOP	field standing operating procedure
FSU	fire support unit
ft	feet
FTI	fixed target indicator
F/W	fixed wing
fwd	forward

G

G2	Assistant Chief of Staff, G2 (Intelligence)
GBCS-(H/L)	ground-based common-sensor (heavy/light)
GCI	ground control intercept
GE	Germany
GHz	gigahertz
GL	grenade launcher
GPS	global positioning system
GRCS	GUARDRAIL Common Sensor
GS	general support
GSM	J-STARS ground station module
GSR	ground surveillance radar

H

H	harrassing fires
HA	humanitarian assistance
HE	high explosive
HF	high frequency
Hg	mercury
HHD	headquarters and headquarters detachment
HHOC	headquarters, headquarters and operations company
HMMWV	high mobility multipurpose wheeled vehicle
HN	host nation
HPT	high-payoff target
HPTL	high payoff target list
HQ	headquarters
hr	hour
HUMINT	human intelligence
HVT	high-value target
hvy	heavy

H/W	hardware

I

I	immediate (effect used in AGM)
IAW	in accordance with
I&S	intelligence and security
I&W	indications and warnings
ID	identify
IDL	interoperable data link
IEW	intelligence and electronic warfare
IEWCS	Intelligence Electronic Warfare Common Sensor
IEWMAA	IEW mission area analysis
IFV	infantry fighting vehicle
IHL	intelligence handover line
IMA	individual mobilization augmentee
IMETS	Integrated Meteorological System
IMINT	imagery intelligence
incorp	incorporate
INF	Intermediate-range Nuclear Forces intelligence
infil	infiltration
info	information
in/h	inches per hour
INMARSAT	International Maritime Satellite
intel	intelligence
intg	interrogation
INTSUM	intelligence summary
IO	information operations
IPB	intelligence preparation of the battlefield
IPDS	Imagery Processing and Dissemination System
IPF	integrated processing facility
IPS	intelligence production section
IPW	interrogation, prisoners of war
IR	information requirements
I-REMBASS	Improved Remotely Monitored Battlefield Sensor System
ISA	International Standardization Agreement
ISB	intelligence support base
ISM	intelligence synchronization matrix
ISSO	information systems security officer
IVL	intervisibility lines

J

J2	Intelligence Directorate
JCMEC	Joint Captured Materiel Exploitation Center
JCS	Joint Chiefs of Staff
JIC	Joint Intelligence Center
J-SIIDS	Joint-Service Interior Intrusion Detector System
JSTARS	Joint Surveillance Target Attack Radar System
JTAGS	Joint Tactical Ground Station
JTF	joint task force
JTT/H	joint tactical terminal/hybrid
JTT/H-R3	joint tactical terminal/hybrid-receive only

K

km	kilometer

L

LAN	local area network
LAV	light armored vehicle
LC	line of contact
LD	line of departure
LEA	Law Enforcement Agency
LLSO	low-level source operations
LLVI	low-level voice intercept
LMRDFS	Lightweight Man-Transportable Radio Direction Finding System
LNO	liaison officer
LOA	limit of advance
LOB	line of bearing
LOC	line of communication
LOS	line of sight
LP	listening post
LPI	low probability of intercept
LRP	long-range patrol
LRRP	long-range reconnaissance patrol
LRS	long-range surveillance
LRSD	long-range surveillance detachment
LRSU	long-range surveillance unit
LRU	long-range unit
LT	light
LTIOV	latest time information is of value
LZ	landing zone

M

m	meter
MASINT	measurement and signals intelligence
Mb	millibar
MC	movement corridor
MC&G	mapping, charting, and geodesy
MCOO	modified combined obstacles overlay
MCSF	Mobile Cryptologic Support Facility
MDCI	multidiscipline counterintelligence
MDMP	military decision-making process
MEA	munitions effects assessment
med	medium
MEDEVAC	medical evacuation
MET	meteorological
METL	mission essential task list
METT-T	mission, enemy, terrain and weather, troops, and time available
METT-TC	mission, enemy, terrain and weather, troops, and time available civilians
MEWSS	Mobile Electronic Warfare Support System
MGS	magnetic grid system
mgt	management
MI	military intelligence
MIES	Modernized Imagery Exploitation System
MIJI	meaconing, intrusion, jamming, and interference
min	minute
MIPB	Military Intelligence Professional Bulletin
MIRS	Miniaturization Imagery Receive System
MIST	military intelligence support team
MITT	Mobile Integrated Tactical Terminal
MLRS	multiple launch rocket system
MOPP	mission-oriented protection posture
MP	military police
MR	moon rise
MS	moon set
MSE	mobile subscriber element
MT	medium tank
MTI	moving target indicator
MTOE	modified table of organization and equipment
MTP	mission training plan

N

N	north; neutralize (effect used in AGM)
NA	not applicable
NAI	named area of interest
NATO	North Atlantic Treaty Organization
NBC	nuclear, biological, and chemical
NCA	National Command Authority
NCO	noncommissioned officer
NEO	noncombatant evacuation operation
NFA	no fire area
NGIC	National Ground Intelligence Center
NGLO	naval gunfire liaison officer
NGO	non-governmental organization
NIMA	National Imagery Mapping Agency
NIST	National Intelligence Support Team
NLT	no later than
nmi	nautical miles
NOD	night observation device
NOE	nap of the earth
noncomm	noncommunications
NRT	near-real time
NVD	night vision devices
NVG	night vision goggles

O

OB	order of battle
OCOKA	obstacles & fields of fire, concealment & cover, key terrain, and avenues of approach
OCONUS	outside continental United States
O/O	on order
OOTW	operations other than war (see SASO)
OP	observation post
OPCON	operational control
OPLAN	operations plan
opns	operations
OPORD	operations order
OPSEC	operations security
OR	operational readiness
OT	operator terminal

P

P	planned
PAO	public affairs office

PDA	physical damage assessment
PEO	peace enforcement operations
photo	photography
PGM	precision-guided munitions
PIR	priority intelligence requirements
PKO	peacekeeping operations
plt	platoon
PMCS	preventive maintenance checks and services
POL	petroleum, oils, lubricants
PP	passage point
prep	preparation
PSA	post-strike assessment
PSYOP	psychological operations
PT	physical training
PVO	private volunteer organization
PZ	pickup zone

Q

QSTAG	Quadripartite Standardization Agreement
qty	quantity

R

R	reconnaissance (sortie category)
R&D	research and development
R&S	reconnaissance and surveillance
RAS	rear area security
RBP	red/black processor
RC	Reserve Components
RCOA	reconnaissance course of action
rcv	receive
RDC	rear detachment commander
recon	reconnaissance
REDTRAIN	readiness training
regt	regiment
REMBASS	Remotely Monitored Battlefield Sensor System
RFI	request for information
RII	request for intelligence information
RISTA	reconnaissance, intelligence, surveillance, and target acquisition
RL	rocket launcher
RNP	radio navigational points (USAF)
ROE	rules of engagement

ROTERM	receive only terminal
RP	release point
rqmts	requirements
RRS	radio relay system
RRT	radio receiver transmission
RRTS	radio relay test set
RSOP	readiness standing operating procedure
RSR	required supply rate
RTO	radiotelephone operator
R/W	rotary wing
RWS	remote workstation

S

S	South; suppress (effect used in AGM)
SA	small arms
S&TI	Scientific & Technical Intelligence
S1	Adjutant (US Army)
S2	Intelligence Officer (US Army)
S3	Operations and Training Officer (US Army)
S4	Supply Officer (US Army)
S5	Civil Affairs Officer (US Army)
SAEDA	Subversion and Espionage Directed Against the US Army
SALUTE	size, activity, location, unit, time, and equipment
SAM	surface-to-air missile
SAR	synthetic aperture radar
SASO	stability and support operations (formerly OOTW)
SATCOM	satellite communications
SCI	sensitive compartmented information
SDO	staff duty officer
SDS	security data system
SEAD	suppression of enemy air defenses
sep bde	separate brigade
SF	Special Forces
SI	special intelligence
SID	secondary imagery dissemination
SIDS	Secondary Imagery Dissemination System
SIGINT	signals intelligence
SIGINT/EW	signals intelligence/electronic warfare
SIGO	signal officer
SII	statement of intelligence interest

SINCGARS	Single-Channel Ground and Airborne Radio System
SIR	specific information requirements
SITMAP	situation map
SJA	Staff Judge Advocate
SLAR	side-looking airborne radar
SOCCE	Special Operations Command and Control Element
SOF	special operations forces
SOFA	Status of Forces Agreement
SOI	signals operating instructions
SOP	standing operating procedure
SOR	specific orders and requests
SOT-A	support operations team-Alpha
SOT-B	support operations team-Bravo
SP	start point
SPIRIT	Special Purpose Integrated Remote Intelligence Terminal
sqdn	squadron
SR	sunrise
SS	sunset
SSM	surface-to-surface missile
SSO	special security office
SSP	single-soure processing
ST	student text
STANAG	Standardization Agreement
STU III	Secure Telephone Unit-Third Generation
SUCCESS	Synthesized UHF Computer Controller Enhanced Subsystem
survl	surveillance
S/W	software
SWO	staff weather officer

T

TA	target acquisition
TAA	tactical assembly area
TAB	target acquisition battery
tac	tactical
TAC	tactical command post
TACFIRE	tactical fire direction system
TACLINK	tactical link
TACSAT	tactical satellite

TADIXS-B	Tactical Data Information Exchange System-Broadcast
TAI	target area of interest
TAREX	target exploitation
TB	tank brigade
TD	tank division
TDA	target development assessment
TDDS	TRAP Data Dissemination System
TDMP	tactical decision-making process
TDOA	time differential of arrival
TECHINT	technical intelligence
TENCAP	Tactical Exploitation of National Capabilities
TF	task force
tgt	target
THAADS	Theater High Altitude Area Defense System
THMT	tactical high mobility terminal
TIBS	Tactical Information Broadcast System
TLE	target location error
TLP	troop-leading procedures
TOC	tactical operations center
TOPS	Tactical Onboard Processing System (for TADIXS-B)
TOW	tube-launched, optically tracked, wire-guided
TPL	time phase line
TRAP	Tactical Related Applications
TRIXS	Tactical Reconnaissance Intelligence Exchange System
trng	training
TROJAN SPIRIT	Special Purpose Integrated Remote Intelligence Terminal
TRRIP	Theater Rapid Response Intelligence Package
TSA	target system assessment
TSOP	tactical standing operating procedure
TSS	target selection standards
TTP	tactics, techniques, and procedures
TUAV	tactical unmanned aerial vehicle
TVA	target value analysis

U

UAV	unmanned aerial vehicle
UBL	unit, basic load
UHF	ulltra high frequency
USAF	US Air Force
USMTF	United States Message Text Formats
USSID	United States Signal Intelligence Directive

UW	unconventional warfare
	V
VHF	very high frequency
vis	visibility
	W
w	with
WARNO	warning order
WATCHCON	watch condition
WBGT	wet-bulb-globe temperature
WETM	weather team
wkstn	workstation
wpn	weapon
	X
XO	executive officer
XPLN	exploitation
xmit	transmit

Section II. Terms.

Global security forecast. A forecast of where, when, and between whom conflicts can occur.

Battlefield development plans. A 5- to 20-year forecast of how selected threat forces will organize and operate on the battlefield.

Automated and hardcopy databases. Databases such as the Stylized Country Force Assessments and the Army Force Planning and Data Assumptions which provide detailed projections on OB, equipment, logistics, and readiness (ground, air, naval forces) of potential threats 2 to 25 years into the future.

TECHINT and User Bulletins. Provide a high resolution view of threat equipment and weapons systems and capabilities, and complement traditional OB information. They can be obtained from NGIC.

Open source studies and articles. State Department background papers, FBIS, public libraries, universities, and corporations with contracts in countries of interest). Databases of sources need to be researched and exercised in advance of mission execution.

Other services. The USMC, other nation's information, fact books, and fact sheets on tactics, terrain, and country studies.

A Tradecraft Primer:
Structured Analytic Techniques
for Improving Intelligence Analysis

Prepared by the US Government

March 2009

This primer highlights structured analytic techniques—some widely used in the private sector and academia, some unique to the intelligence profession. It is not a comprehensive overview of how intelligence officers conduct analysis. Rather, the primer highlights how structured analytic techniques can help one challenge judgments, identify mental mindsets, stimulate creativity, and manage uncertainty. In short, incorporating regular use of techniques such as these can enable one to structure thinking for wrestling with difficult questions.

TABLE OF CONTENTS

Introduction 1

How To Use These Techniques 5

Diagnostic Techniques 7
- Key Assumptions Check 7
- Quality of Information Check 10
- Indicators or Signposts of Change 12
- Analysis of Competing Hypotheses (ACH) 14

Contrarian Techniques 17
- Devil's Advocacy 17
- Team A/Team B 19
- High-Impact/Low-Probability Analysis 22
- "What If?" Analysis 24

Imaginative Thinking Techniques 27
- Brainstorming 27
- Outside-In Thinking 30
- Red Team Analysis 31
- Alternative Futures Analysis 34

Strategies for Using Structured Analytic Techniques 38

Selective Bibliography 40

THE "MIND-SET" CHALLENGE

Using the analytic techniques contained in this primer will assist analysts in dealing with the perennial problems of intelligence: the complexity of international developments, incomplete and ambiguous information, and the inherent limitations of the human mind. Understanding the intentions and capabilities of adversaries and other foreign actors is challenging, especially when either or both are concealed. Moreover, transnational threats today pose even greater complexity, in that they involve multiple actors—including nonstate entities—that can adapt and transform themselves faster than those who seek to monitor and contain them. Finally, globalization has increased the diversity of outcomes when complex, interactive systems such as financial flows, regional economies or the international system as a whole are in flux.[2]

The first hurdle for analysts is identifying the relevant and diagnostic information from the increasing volume of ambiguous and contradictory data that is acquired through open source and clandestine means. Analysts must also pierce the shroud of secrecy—and sometimes deception—that state and nonstate actors use to mislead. A systematic approach that considers a range of alternative explanations and outcomes offers one way to ensure that analysts do not dismiss potentially relevant hypotheses and supporting information resulting in missed opportunities to warn.

Cognitive and perceptual biases in human perception and judgment are another important reason for analysts to consider alternatives. As Richards Heuer and others have argued, all individuals assimilate and evaluate information through the medium of "mental models" (sometimes also called "frames" or "mind-sets"). These are experience-based constructs of assumptions and expectations both about the world in general and more specific domains. These constructs strongly influence what information analysts will accept—that is, data that are in accordance with analysts' unconscious mental models are more likely to be perceived and remembered than information that is at odds with them.

Mental models are critical to allowing individuals to process what otherwise would be an incomprehensible volume of information. Yet, they can cause analysts to overlook, reject, or forget important incoming or missing information that is not in accord with their assumptions and expectations. Seasoned analysts may be more susceptible to these mind-set problems as a result of their expertise and past success in using time-tested mental models. The key risks of mind-sets are that: analysts perceive what they expect to perceive; once formed, they are resistant to change; new information is assimilated, sometimes erroneously, into existing mental models; and conflicting information is often dismissed or ignored.

> *"Intelligence analysts should be self-conscious about their reasoning processes. They should think about how they make judgments and reach conclusions, not just about the judgments and conclusions themselves."*
>
> —Richards Heuer, *The Psychology of Intelligence Analysis*[1]

[1] Richards J. Heuer, Jr., *The Psychology of Intelligence Analysis* (Washington: Center for the Study of Intelligence, 1999).

[2] These observations were drawn from a lengthier treatment of cognitive bias found in the Sherman Kent Center's Occasional Paper, *Making Sense of Transnational Threats*, Vol. 3, No. 1, October 2004.

Common Perceptual and Cognitive Biases

Perceptual Biases

Expectations. We tend to perceive what we expect to perceive. More (unambiguous) information is needed to recognize an unexpected phenomenon.

Resistance. Perceptions resist change even in the face of new evidence.

Ambiguities. Initial exposure to ambiguous or blurred stimuli interferes with accurate perception, even after more and better information becomes available.

Biases in Evaluating Evidence

Consistency. Conclusions drawn from a small body of consistent data engender more confidence than ones drawn from a larger body of less consistent data.

Missing Information. It is difficult to judge well the potential impact of missing evidence, even if the information gap is known.

Discredited Evidence. Even though evidence supporting a perception may be proved wrong, the perception may not quickly change.

Biases in Estimating Probabilities

Availability. Probability estimates are influenced by how easily one can imagine an event or recall similar instances.

Anchoring. Probability estimates are adjusted only incrementally in response to new information or further analysis.

Overconfidence. In translating feelings of certainty into a probability estimate, people are often overconfident, especially if they have considerable expertise.

Biases in Perceiving Causality

Rationality. Events are seen as part of an orderly, causal pattern. Randomness, accident and error tend to be rejected as explanations for observed events. For example, the extent to which other people or countries pursue a coherent, rational, goal-maximizing policy is overestimated.

Attribution. Behavior of others is attributed to some fixed nature of the person or country, while our own behavior is attributed to the situation in which we find ourselves.

Intelligence analysts must actively review the accuracy of their mind-sets by applying structured analytic techniques that will make those mental models more explicit and expose their key assumptions. The techniques found in this primer are designed to assist in this regard by:

- Instilling more structure into the intelligence analysis.
- Making analytic arguments more transparent by articulating them and challenging key assumptions.
- Stimulating more creative, "out-of-the-box" thinking and examining alternative outcomes, even those with low probability, to see if available data might support these outcomes.
- Identifying indicators of change (or signposts) that can reduce the chances of surprise.

Incorporating findings derived from these techniques into our intelligence products also serves the policymaker by:

- Highlighting potential changes that would alter key assessments or predictions.
- Identifying key assumptions, uncertainties, intelligence gaps and disagreements that might illuminate risks and costs associated with policy choices.
- Exploring alternative outcomes for which policy actions might be necessary.

Strategic Assumptions That Were Not Challenged

1941 World War II

Japan would avoid all-out war because it recognized US military superiority.

Given that US superiority would only increase, Japan might view a first strike as the only way to knock America out of the war.

1950s Korean War

China would not cross the Yalu River in support of the North Korean government.

Red China could make good on its threats to counter "US aggression" against the North.

1962 Cuban Missile Crisis

The Soviet Union would not introduce offensive nuclear weapons into Cuba.

The Kremlin could miscalculate and believe it could create a fait accompli that a young US President would not be prepared to reverse.

1973 Yom Kippur War

Arabs knew they could not win because they had failed to cooperate in the past and still lacked sufficient air defenses to counter Israeli airpower.

A surprise Arab attack, even if repelled, could wound Israel psychologically and prompt international calls for cease-fires and diplomatic negotiations.

1989 German Unification

East Germany could not unify with the West Germany against the wishes of the Soviet Union.

The Soviet Union—under Gorbachev—might not be prepared to intervene militarily in Eastern Europe as it had in the past.

1998 Indian Nuclear Test

Conducting a nuclear test risked international condemnation and US sanctions and would threaten a newly elected coalition government.

A successful and surprise nuclear test could boost Indian nationalist pride and solidify public support for a shaky coalition government.

2003 Iraq's WMD Programs

Saddam failed to cooperate with UN inspectors because he was continuing to develop weapons of mass destruction.

If Iraqi authorities had destroyed their WMD stocks and abandoned their programs, they might refuse to fully acknowledge this to the UN to maintain Iraq's regional status, deterrence, and internal regime stability.

HOW TO USE THESE TECHNIQUES

The analytic techniques in this primer are designed to help individual analysts, as well as teams, explore and challenge their analytical arguments and mind-sets. Some techniques are fairly simple to understand and employ—such as Brainstorming and Devil's Advocacy. Others are more complex and demand a greater degree of analytical sophistication, resource commitment, and time. All the techniques are included because they have helped other analysts avoid rigid ways of thinking or assisted them in exploring new outcomes or implications of an intelligence problem.

The techniques are grouped by their purpose: **diagnostic** techniques are primarily aimed at making analytic arguments, assumptions, or intelligence gaps more transparent; **contrarian** techniques explicitly challenge current thinking; and **imaginative thinking** techniques aim at developing new insights, different perspectives and/or develop alternative outcomes. In fact, many of the techniques will do some combination of these functions. However, analysts will want to select the tool that best accomplishes the specific task they set out for themselves. Although application of these techniques alone is no guarantee of analytic precision or accuracy of judgments, it does improve the sophistication and credibility of intelligence assessments as well as their usefulness to policymakers. As Richards Heuer notes in his own work on cognitive bias, "analysis can be improved."[3]

[3] Heuer, *Psychology of Intelligence Analysis*, p. 184.

KEY ASSUMPTIONS CHECK

List and review the key working assumptions on which fundamental judgments rest.

WHEN TO USE

A Key Assumptions Check is most useful at the beginning of an analytic project. An individual analyst or a team can spend an hour or two articulating and reviewing the key assumptions. Rechecking assumptions also can be valuable at any time prior to finalizing judgments, to insure that the assessment does not rest on flawed premises. Identifying hidden assumptions can be one of the most difficult challenges an analyst faces, as they are ideas held—often unconsciously—to be true and, therefore, are seldom examined and almost never challenged.

A key assumption is any hypothesis that analysts have accepted to be true and which forms the basis of the assessment. For example, military analysis may focus exclusively on analyzing key technical and military variables (sometimes called factors) of a military force and "assume" that these forces will be operated in a particular environment (desert, open plains, arctic conditions, etc.). Postulating other conditions or assumptions, however, could dramatically impact the assessment. Historically, US analysis of Soviet-Warsaw Pact operations against NATO had to "assume" a level of non-Soviet Warsaw Pact reliability (e.g., would these forces actually fight?). In this case, there was high uncertainty and depending on what level of reliability one assumed, the analyst could arrive at very different conclusions about a potential Soviet offensive operation. Or when economists assess the prospects for foreign economic reforms, they may consciously, or not, assume a degree of political stability in those countries or the region that may or may not exist in the future. Likewise, political analysts reviewing a developing country's domestic stability might unconsciously assume stable oil prices, when this key determinant of economic performance and underlying social peace might fluctuate. All of these examples highlight the fact that analysts often rely on stated and unstated assumptions to conduct their analysis. The goal is not to undermine or abandon key assumptions; rather, it is to make them explicit and identify what information or developments would demand rethinking them.

VALUE ADDED

Explicitly identifying working assumptions during an analytic project helps:

- Explain the logic of the analytic argument and expose faulty logic.
- Understand the key factors that shape an issue.
- Stimulate thinking about an issue.
- Uncover hidden relationships and links between key factors.
- Identify developments that would cause you to abandon an assumption.
- Prepare analysts for changed circumstances that could surprise them.

Key Assumptions Check: The 2002 DC Sniper Case

The outbreak of sniper shootings in the Washington, DC area in the fall of 2002 provides a good example of how this technique could have been applied. After the initial flurry of shootings, the operating assumption that quickly emerged was that the shootings were the work of a single, white male who had some military training and was driving a white van. If law enforcement officials had conducted a Key Assumptions Check, they could have broken this statement into its key components and assessed the validity of each statement as follows:

Key Assumption	Assessment
The sniper is a male.	Highly likely (but not certain) given past precedent with serial killers. We are taking little risk by not looking for a female.
The sniper is acting alone.	Highly likely (but not certain) given past precedents.
The sniper is white.	Likely, but not as certain, given past precedents. We would be taking some risk if we rule out nonwhites as suspects.
The sniper has military training/experience.	Possible, but not sufficient reason to exclude from consideration potential suspects who have not had any military training.
The sniper is driving a white van.	Possible because you have a credible eyewitness account but worthy of continuing scrutiny given the number of white vans in the area (more than 70,000 registered in the Maryland suburbs of Metropolitan Washington, DC) and that different kinds of vehicles are being described.

A Key Assumptions Check could have allowed law enforcement officials to:

- Avoid jumping to conclusions (the sniper is white, has military training, and is driving a white van) that did not hold up under closer scrutiny. By explicitly examining each assumption, officials could have avoided prematurely narrowing down the potential pool of suspects to a group that did not include the actual perpetrator. Similarly, they might have been more cautious about accepting that the sniper was driving a white van.
- Be receptive to new leads and citizen tips, such as eyewitness reports that the sniper fled the scene driving a specific model Chevrolet.
- More seriously consider evidence that subsequently became available, which contradicted a key assumption. If officials had stated explicitly that they were assuming the sniper was acting alone, they might have been sensitive to new information that contradicted that key assumption. Often this type of information gets “lost in the noise” if the analyst has not already thought about what key assumptions he or she is making.

THE METHOD

Checking for key assumptions requires analysts to consider how their analysis depends on the validity of certain premises, which they do not routinely question or believe to be in doubt. A four-step process will help analysts:

1. Review what the current analytic line on this issue appears to be; write it down for all to see.

2. Articulate all the premises, both stated and unstated in finished intelligence, which are accepted as true for this analytic line to be valid.

3. Challenge each assumption, asking why it "must" be true and whether it remains valid under all conditions.

4. Refine the list of key assumptions to contain only those that "must be true" to sustain your analytic line; consider under what conditions or in the face of what information these assumptions might not hold.

QUESTIONS TO ASK DURING THIS PROCESS INCLUDE:

- How much confidence exists that this assumption is correct?
- What explains the degree of confidence in the assumption?
- What circumstances or information might undermine this assumption?
- Is a key assumption more likely a key uncertainty or key factor?
- Could the assumption have been true in the past but less so now?
- If the assumption proves to be wrong, would it significantly alter the analytic line? How?
- Has this process identified new factors that need further analysis?

QUALITY OF INFORMATION CHECK

Evaluates completeness and soundness of available information sources.

WHEN TO USE

Weighing the validity of sources is a key feature of any critical thinking. Moreover, establishing how much confidence one puts in analytic judgments should ultimately rest on how accurate and reliable the information base is. Hence, checking the quality of information used in intelligence analysis is an ongoing, continuous process. Having multiple sources on an issue is not a substitute for having good information that has been thoroughly examined. Analysts should perform periodic checks of the information base for their analytic judgments. Otherwise, important analytic judgments can become anchored to weak information, and any "caveats" attached to those judgments in the past can be forgotten or ignored over time.

If a major analytic assessment is planned, analysts should individually or collectively review the quality of their information and refresh their understanding of the strengths and weaknesses of past reporting on which an analytic line rests. Without understanding the context and conditions under which critical information has been provided, it will be difficult for analysts to assess the information's validity and establish a confidence level in an intelligence assessment.

VALUE ADDED

A thorough review of information sources provides analysts—as well as policymakers—with an accurate assessment of "what we know" and "what we do not know." It is also an opportunity to confirm that sources have been cited accurately. In the case of HUMINT, this will require extensive review of the sources' background information and access as well as his or her motivation for providing the information. Similarly, reviewing technical sourcing can sometimes reveal inadvertent errors in processing, translation, or interpretation that otherwise might have gone unnoticed.

In addition, a quality of information check can be valuable to both collectors and policymakers:

- It can help to detect possible deception and denial strategies by an adversary.
- It can identify key intelligence gaps and new requirements for collectors.
- It can assist policymakers in understanding how much confidence analysts are placing on analytic judgments.

THE METHOD

An analyst or a team might begin a quality of information check by developing a database in which information is stored according to source type and date, with additional notations indicating strengths or weaknesses in those sources.[4] Ideally, analysts would have a retrieval and search capability on the database, so that periodic reviews are less labor intensive and result in a more complete review of all sources used in past analysis. For the information review to be fully effective, analysts will need as much background information on sources as is feasible. Knowing the circumstances in which reporting was obtained is often critical to understanding its validity. With the data in hand, analysts can then:

- Review systematically all sources for accuracy.
- Identify information sources that appear most critical or compelling.
- Check for sufficient and strong corroboration of critical reporting.
- Reexamine previously dismissed information in light of new facts or circumstances that cast it in a different light.
- Ensure that any recalled reporting is identified and properly flagged for other analysts; analysis based on recalled reporting should also be reviewed to determine if the reporting was essential to the judgments made.
- Consider whether ambiguous information has been interpreted and caveated properly.
- Indicate a level of confidence that analysts can place in sources, which are likely to figure in future analytic assessments.

[4] Analysis of Competing Hypotheses (ACH), discussed later in the primer, is a useful technique for exploring the possibility that deception could explain the absence of evidence.

Quality of Information Problem on Iraq

". . . Analysts community wide are unable to make fully informed judgments on the information they received, relying instead on nonspecific source lines to reach their assessments. Moreover, relevant operational data is nearly always withheld from analysts, putting them at a further analytical disadvantage . . ."

—*Senate Select Committee on Intelligence, Report on the US Intelligence Community's Prewar Intelligence Assessments on Iraq*

"Analytic errors included over-reliance on a single, ambiguous source, [and, in addition to collection shortfalls] failure of analysts to understand fully the limitations of technical collection . . ."

"The Intelligence Community relied too heavily on ambiguous imagery indicators . . ."

—*Commission on the Intelligence Capabilities of the United States Regarding Weapons of Mass Destruction.*

INDICATORS OR SIGNPOSTS OF CHANGE

Periodically review a list of observable events or trends to track events, monitor targets, spot emerging trends, and warn of unanticipated change.

WHEN TO USE

An analyst or team can create an indicators or signposts list of observable events that one would expect to see if a postulated situation is developing; e.g., economic reform, military modernization, political instability, or democratization. Constructing the list might require only a few hours or as much as several days to identify the critical variables associated with the targeted issue. The technique can be used whenever an analyst needs to track an event over time to monitor and evaluate changes. However, it can also be a very powerful aid in supporting other structured methods explained later in this primer. In those instances, analysts would be watching for mounting evidence to support a particular hypothesis, low-probability event, or scenario.

When there are sharply divided views on an issue, an indicators or signposts list can also "depersonalize" the argument by shifting analytic attention to a more objective set of criteria. Using an indicators list can clarify substantive disagreements, once all sides agree on the set of objective criteria used to measure the topic under study.

VALUE ADDED

By providing an objective baseline for tracking events or targets, indicators instill rigor into the analytic process and enhance the credibility of analytic judgments. An indicators list included in a finished product also allows the policymaker to track developments and builds a more concrete case for the analytic judgments. By laying out a list of critical variables, analysts also will be generating hypotheses regarding why they expect to see the presence of such factors. In so doing, analysts make the analytic line much more transparent and available for scrutiny by others.

THE METHOD

Whether used alone, or in combination with other structured analysis, the process is the same:

- Identify a set of competing hypotheses or scenarios.
- Create separate lists of potential activities, statements, or events expected for each hypothesis or scenario.
- Regularly review and update the indicators lists to see which are changing.
- Identify the most likely or most correct hypotheses or scenarios, based on the number of changed indicators that are observed.

Developing two lists of indicators for each hypothesis or scenario may prove useful to distinguish between indicators that a development is or is not emerging. This is particularly useful in a "What If?" Analysis, when it is important to make a case that a certain event is unlikely to happen.

Tracking the Potential for Political Instability in a Foreign Country

Topics	Indicators	1999				2000		
		I	*II*	*III*	*IV*	*I*	*II*	*III*

Government mismanagement of natural disaster or national emergency							
Death of key figure							

■ Serious concern
● Substantial concern
● Moderate concern
● Low concern
● Negligible concern

Tracking the Potential for Political Instability in an Indicators Matrix. Analysts tracked the potential for regime change in 2000 and identified a list of indicators, to which they posed the question, "is this occurring or not? Analysts also went further and developed a list of "trigger mechanisms" that might bring about a political shift.

ANALYSIS OF COMPETING HYPOTHESES (ACH)

Identification of alternative explanations (hypotheses) and evaluation of all evidence that will disconfirm rather than confirm hypotheses.

WHEN TO USE

Analysis of Competing Hypotheses (ACH) has proved to be a highly effective technique when there is a large amount of data to absorb and evaluate. While a single analyst can use ACH, it is most effective with a small team that can challenge each other's evaluation of the evidence. Developing a matrix of hypotheses and loading already collected information into the matrix can be accomplished in a day or less. If the data must be reassembled, the initial phases of the ACH process may require additional time. Sometimes a facilitator or someone familiar with the technique can lead new analysts through this process for the first time.

ACH is particularly appropriate for controversial issues when analysts want to develop a clear record that shows what theories they have considered and how they arrived at their judgments. Developing the ACH matrix allows other analysts (or even policymakers) to review their analysis and identify areas of agreement and disagreement. Evidence can also be examined more systematically, and analysts have found that this makes the technique ideal for considering the possibility of deception and denial.

VALUE ADDED

ACH helps analysts overcome three common mistakes that can lead to inaccurate forecasts:

- Analysts often are susceptible to being unduly influenced by a first impression, based on incomplete data, an existing analytic line, or a single explanation that seems to fit well enough.
- Analysts seldom generate a full set of explanations or hypotheses at the outset of a project.
- Analysts often rely on evidence to support their preferred hypothesis, but which also is consistent with other explanations.

In essence, ACH helps analysts to avoid picking the first solution that seems satisfactory instead of going through all the possibilities to arrive at the very best solution.

THE METHOD

ACH demands that analysts explicitly identify all the reasonable alternative hypotheses, then array the evidence against each hypothesis—rather than evaluating the plausibility of each hypothesis one at a time. To create a level playing field, the process must:

- Ensure that all the information and argumentation is evaluated and given equal treatment or weight when considering each hypothesis.
- Prevent the analyst from premature closure on a particular explanation or hypothesis.
- Protect the analyst against innate tendencies to ignore or discount information that does not fit comfortably with the preferred explanation at the time.

To accomplish this, the process should follow these steps:

- Brainstorm among analysts with different perspectives to identify all possible hypotheses.
- List all significant evidence and arguments relevant to all the hypotheses.

- Prepare a matrix with hypotheses across the top and each piece of evidence on the side. Determine whether each piece of evidence is consistent, inconsistent, or not applicable to each hypothesis.[5]
- Refine the matrix and reconsider the hypotheses—in some cases, analysts will need to add new hypotheses and re-examine the information available.
- Focus on disproving hypotheses rather than proving one. Talley the pieces of evidence that are inconsistent and consistent with each hypothesis to see which explanations are the weakest and strongest.

[5] The "diagnostic value" of the evidence will emerge as analysts determine whether a piece of evidence is found to be consistent with only one hypothesis, or could support more than one or indeed all hypotheses. In the latter case, the evidence can be judged as unimportant to determining which hypothesis is more likely correct.

- Analyze how sensitive the ACH results are to a few critical items of evidence; should those pieces prove to be wrong, misleading, or subject to deception, how would it impact an explanation's validity?
- Ask what evidence is not being seen but would be expected for a given hypothesis to be true. Is denial and deception a possibility?
- Report all the conclusions, including the weaker hypotheses that should still be monitored as new information becomes available.
- Establish the relative likelihood for the hypotheses and report all the conclusions, including the weaker hypotheses that should still be monitored as new information becomes available.
- Identify and monitor indicators that would be both consistent and inconsistent with the full set of hypotheses. In the latter case, explore what could account for inconsistent data.

Terrorism in Tokyo From Aum Shinrikyo

		Weight	H: 1	H: 4	H: 2	H: 3
			Kooky Cult	Terrorist Group	Political Movement	Criminal Group
	Inconsistency Score ⇨		-1.0	-1.0	-2.0	-3.0
E3	Attacks on Journalists	MEDIUM	I	N	I	I
E2	Religious Affiliation	MEDIUM	C	I	I	I
E4	Established Party	MEDIUM	N	N	C	I
E1	Blind Leader Mastsumoto	MEDIUM	C	C	C	C

ACH Matrix of Terrorism in Tokyo. In March 1995, a largely unknown group attacked the Tokyo subways by using a highly lethal nerve agent known as sarin. ACH provides a mechanism to carefully examine all the evidence and possible explanations for understanding what type of group could have been responsible. In simplified form, the above matrix arrays each piece of evidence on the vertical axis and then evaluates each in terms of the item's consistency with four possible explanations for the terrorist attack in Tokyo (horizontal axis). Analysts rate a piece of evidence as consistent (C); inconsistent (I); or neutral (N). This process allows analysts to see that some evidence will be consistent with more than one hypothesis and be less valuable in disproving hypotheses.

DEVIL'S ADVOCACY

Challenging a single, strongly held view or consensus by building the best possible case for an alternative explanation.

WHEN TO USE

Devil's Advocacy is most effective when used to challenge an analytic consensus or a key assumption regarding a critically important intelligence question. On those issues that one cannot afford to get wrong, Devil's Advocacy can provide further confidence that the current analytic line will hold up to close scrutiny. An individual analyst can often assume the role of the Devil's Advocate if he or she has some doubts about a widely held view, or a manager might designate a courageous analyst to challenge the prevailing wisdom in order to reaffirm the group's confidence in those judgments. In some cases, the analyst or a team can review a key assumption of a critical judgment in the course of their work, or more likely, a separate analytic product can be generated that arrays all the arguments and data that support a contrary hypothesis. While this can involve some analytic time and effort, when a group of analysts have worked on an issue for a long period of time, it is probably wise to assume that a strong mind-set exists that deserves the closer scrutiny provided by Devil's Advocacy.

VALUE ADDED

Analysts have an obligation to policymakers to understand where their own analytic judgments might be weak and open to future challenge. Hence, the Devil's Advocacy process can highlight weaknesses in a current analytic judgment or alternatively help to reaffirm one's confidence in the prevailing judgments by:

- Explicitly challenging key assumptions to see if they will not hold up under some circumstances.
- Identifying any faulty logic or information that would undermine the key analytic judgments.
- Presenting alternative hypotheses that would explain the current body of information available to analysts.

Its primary value is to serve as a check on a dominant mind-set that can develop over time among even the best analysts who have followed an issue and formed strong consensus that there is only one way of looking at their issue. This mind-set phenomenon makes it more likely that contradictory evidence is dismissed or not given proper weight or consideration. An exercise aimed at highlighting such evidence and proposing another way of thinking about an issue can expose hidden assumptions and compel analysts to review their information with greater skepticism about their findings. The analyst could come away from the exercise more certain that: 1) the current analytic line was sound; 2) the argument is still the strongest, but that there are areas where further analysis is needed; or 3) some serious flaws in logic or supporting evidence suggest that the analytic line needs to be changed or at least caveated more heavily.

THE METHOD

To challenge the prevailing analytic line, the Devil's Advocate must:

- Outline the mainline judgment and key assumptions and characterize the evidence supporting that current analytic view.
- Select one or more assumptions—stated or not—that appear the most susceptible to challenge.
- Review the information used to determine whether any is of questionable validity, whether deception is possibly indicated, or whether major gaps exist.

- Highlight the evidence that could support an alternative hypothesis or contradicts the current thinking.

- Present to the group the findings that demonstrate there are flawed assumptions, poor quality evidence, or possible deception at work.

- Consider drafting a separate contrarian paper that lays out the arguments for a different analytic conclusion if the review uncovers major analytic flaws.

- Be sure that any products generated clearly lay out the conventional wisdom and are identified as an explicitly "Devil's Advocate" project; otherwise, the reader can become confused as to the current official view on the issue.

TEAM A/TEAM B

Use of separate analytic teams that contrast two (or more) strongly held views or competing hypotheses.

WHEN TO USE

A Team A/Team B approach is different from Devil's Advocacy, where the purpose is to challenge a single dominant mind-set. Instead, Team A/Team B recognizes that there may be competing and possibly equally strong mind-sets held on an issue that need to be clarified. Sometimes analysts confuse the two techniques by drafting a Team B exercise that is really a Devil's Advocacy exercise.

If there are at least two competing views within an analytic office or perhaps competing opinions within the policymaking community on a key issue, then Team A/Team B analysis can be the appropriate technique to use. Developing a full-blown Team A/Team B exercise requires a significant commitment of analytic time and resources, so it is worthwhile considering if the analytic issue merits this kind of attention.

A longstanding policy issue, a critical decision that has far-reaching implications, or a dispute within the analytic community that has obstructed effective cross-agency cooperation would be grounds for using Team A/Team B. If those circumstances exist, then analysts will need to review all of the data to develop alternative papers that can capture the essential differences between the two viewpoints.

VALUE ADDED

Managers have found that when there are office tensions among competing factions of analysts, a Team A/Team B approach can help opposing experts see the merit in the other group's perspective. The process of conducting such an exercise can reduce the friction and even narrow the differences. At a minimum, it allows those holding opposing views to feel that their views have been given equal attention.

For the policymaker, this technique helps to surface and explain important analytic differences within the expert community. Often senior officials can learn more by weighing well-argued conflicting views than from reading an assessment that masks substantive differences or drives analysis to the lowest common denominator. By making the key assumptions and information used for each argument more transparent, a policymaker can judge the merits of each case, pose questions back to the analysts, and reach an independent judgment on which argument is the strongest. Moreover, highlighting alternative views puts collectors on notice that they need to be searching for new information that can confirm or disconfirm a range of hypotheses.

If opposing positions are well established, it can be useful to place analysts on teams that will advocate positions they normally do not support; forcing analysts to argue "the other side" can often make them more aware of their own mind-set.

A Team A/Team B View: China's Military

A: *China's Hollow Military* by Bates Gill and Michael O'Hanlon	B: *China's Military: A Second Opinion* by James Lilley and Carl Ford
". . . We believe that the recent clamor over China's strategic ambitions is greatly overblown. Most of the Chinese aims that run counter to US interests are in fact not global or ideological but territorial in nature and confined primarily to the islands and waterways to China's south and southeast . . . An enormous gap separates China's military capabilities from its aspirations. The PRC's armed forces are not very good and not getting better very fast. Whatever China's concerns and intentions, its capacity to act upon them in ways inimical to US interests is severely limited, and will remain so for many years . . . The PRC's power projection capabilities, too, are constrained by huge weaknesses–especially in areas such as aerial refueling, electronic warfare, command and control and amphibious and air assault assets. China owns considerably less top-level equipment than medium powers like Japan and Britain; it owns even less than smaller powers such as Italy, South Korea or The Netherlands . . . The resources it devotes to acquiring modern weaponry are akin to those of countries spending $10-20 billion a year on defense . . ."	". . . We think they got it half right. China is no military superpower and will not acquire that status for some years to come. But measured in terms of its capacity to challenge key US allies in East Asia, China's capabilities have grown exponentially . . . By emphasizing direct comparisons between the defense capabilities of the United States and the PRC, the authors create an artificial and misleading construct . . . What the regime gives every indication of striving for is sufficient military clout to achieve its aims in Asia. In the short term, it wishes to intimidate Taiwan sufficiently to bring about unification on Beijing's terms . . . . . . Investments of the sort Beijing is making can mean only one thing: China is determined to improve the PLA's fighting capability. While most nations are reducing defense expenditures in the post–Cold War era, China is one of the few doing the opposite . . . Across the board, the PLA is engaged in a major spending effort to upgrade weapons and equipment and improve its operational capability. According to the Pentagon, these efforts have already enhanced China's ability to project military power . . ."

—Excerpted from journal articles found in The National Interest, Fall and Winter 2000/2001.

THE METHOD

Analysis Phase. A Team A/Team B exercise can be conducted on an important issue to:

- Identify the two (or more) competing hypotheses or points of view.
- Form teams or designate individuals to develop the best case that can be made for each hypothesis.
- Review all pertinent information that supports their respective positions.
- Identify missing information that would buttress their hypotheses.
- Structure each argument with an explicit presentation of key assumptions, key pieces of evidence, and careful articulation of the logic behind the argument.

Debate Phase. An oral presentation of the alternative arguments and rebuttals in parallel fashion can then be organized for the benefit of other analysts:

- Set aside time for an oral presentation of the alternative team findings; this can an informal brainstorming session or a more formal "debate."
- Have an independent "jury of peers" listen to the oral presentation and be prepared to question the teams regarding their assumptions, evidence, or logic.
- Allow each team to present their case, challenge the other team's arguments, and rebut the opponent's critique of its case.
- Let the jury consider the strength of each presentation and recommend possible next steps for further research and collection efforts.

HIGH-IMPACT/LOW-PROBABILITY ANALYSIS

Highlights a seemingly unlikely event that would have major policy consequences if it happened.

WHEN TO USE

High-Impact/Low-Probability Analysis is a contrarian technique that sensitizes analysts to the potential impact of seemingly low probability events that would have major repercussions on US interests. Using this technique is advisable when analysts and policymakers are convinced that an event is unlikely but have not given much thought to the consequences of its occurrence. In essence, this can be a warning that the intelligence and policy communities must be alert to an unexpected but not impossible event. For example, the fall of the Shah, the collapse of the Soviet Union, and the reunification of Germany were all considered low probability events at one time; however, analysts might have benefited from considering the consequences of such events and how they might plausibly have come about.

VALUE ADDED

Mapping out the course of an unlikely, yet plausible, event can uncover hidden relationships between key factors and assumptions; it also can alert analysts to oversights in the mainstream analytic line. In addition, an examination of the "unthinkable" allows analysts to develop signposts that may provide early warning of a shift in the situation. By periodically reviewing these indicators an analyst is more likely to counter any prevailing mind-set that such a development is highly unlikely.

THE METHOD

If there is a strongly held view that an event is unlikely, then postulating precisely the opposite should not be difficult.

- Define the high-impact outcome clearly. This process is what will justify examining what most analysts believe to be a very unlikely development.
- Devise one or more plausible explanations for or "pathways" to the low probability outcome. This should be as precise as possible, as it can help identify possible indicators for later monitoring.
- Insert possible triggers or changes in momentum if appropriate. These can be natural disasters, sudden health problems of key leaders, or new economic or political shocks that might have occurred historically or in other parts of the world.
- Brainstorm with analysts having a broad set of experiences to aid the development of plausible but unpredictable triggers of sudden change.
- Identify for each pathway a set of indicators or "observables" that would help you anticipate that events were beginning to play out this way.
- Identify factors that would deflect a bad outcome or encourage a positive outcome.

High Impact of a Low-Probability Event: Pearl Harbor

". . . So far as relations directly between the United States and Japan are concerned, there is less reason today than there was a week ago for the United States to be apprehensive lest Japan make "war" on this country.

Were it a matter of placing bets, the undersigned would give odds of five to one that the United States and Japan will not be at "war" on or before December 15; would wager three to one that the United States and Japan will not be at 'war' on or before the 15th of January (i.e, seven weeks from now); would wager even money that the United States and Japan will not be at "war" on or before March 1 (a date more than 90 days from now) . . ."

—State Department Special Assessment, 27 November 1941

High-Impact/Low-Probability Analysis on 9/11

The 9/11 Commission report includes examination of speculative analysis that was provided to senior policymakers highlighting what were thought to be highly unlikely scenarios that would have a very high impact. One of those items was the 6 August 2001 President's Daily Brief, which stated:

Al-Qai'da members—including some who are US citizens—have resided in or traveled to the US for years, and the group apparently maintains a support structure that could aid attacks. Two al-Qai'da members found guilty in the conspiracy to bomb our embassies in East Africa were US citizens, and a senior EIJ [Egyptian Islamic Jihad] member lived in California in the mid-1990s.

- A clandestine source said in 1998 that a Bin Ladin cell in New York was recruiting Muslim-American youth for attacks.

We have not been able to corroborate some of the more sensational threat reporting, such as that from a service in 1998 saying that Bin Ladin wanted to hijack a US aircraft to gain the release of "Blind Shaykh" 'Umar Abd al-Rahman and other US-held extremists.

—9/11 Commission Report, declassified and approved for release 10 April 2004.

"WHAT IF?" ANALYSIS

Assumes that an event has occurred with potential (negative or positive) impact and explains how it might come about.

WHEN TO USE

"What If?" analysis is another contrarian technique for challenging a strong mind-set that an event will not happen or that a confidently made forecast may not be entirely justified. It is similar to a High-Impact/Low-Probability analysis, but it does not dwell on the consequences of the event as much as it accepts the significance and moves directly to explaining how it might come about.

VALUE ADDED

By shifting the focus from whether an event could occur to how it may happen, analysts allow themselves to suspend judgment about the likelihood of the event and focus more on what developments—even unlikely ones—might enable such an outcome. An individual analyst or a team might employ this technique and repeat the exercise whenever a critical analytic judgment is made.

Using this technique is particularly important when a judgment rests on limited information or unproven assumptions. Moreover, it can free analysts from arguing about the probability of an event to considering its consequences and developing some indicators or signposts for its possible emergence. It will help analysts address the impact of an event, the factors that could cause—or alter—it, and likely signposts that an event is imminent.

A "What If?" analysis can complement a difficult judgment reached and provide the policymaker a thoughtful caution to accepting the conventional wisdom without considering the costs and risks of being wrong. This can help decision-makers consider ways to hedge their bets, even if they accept the analytic judgment that an event remains unlikely.

THE METHOD

Like other contrarian methods, "What If?" analysis must begin by stating clearly the conventional analytic line and then stepping back to consider what alternative outcomes are too important to dismiss, even if unlikely. Brainstorming over a few days or weeks can develop one or more plausible scenarios by which the unlikely event occurs:

- Assume the event has happened.
- Select some triggering events that permitted the scenario to unfold to help make the "what if" more plausible; for example, analysts might postulate the death of a leader, a natural disaster, or some economic event that would start a chain of other events.
- Develop a chain of argumentation based as much on logic as evidence to explain how this outcome could have come about.
- "Think backwards" from the event in concrete ways–that is, specifying what must actually occur at each stage of the scenario is often very useful.
- Identify one or more plausible pathways or scenarios to the unlikely event; very often more than one will appear possible.
- Generate a list of indicators or "observables" for each scenario that would help to detect the beginnings of the event.
- Consider the scope of the positive and negative consequences of each scenario and their relative impacts.
- Monitor the indicators developed on a periodic basis.

"What If?" Analysis: An Unlikely Outcome in Yugoslavia, 1990.

The possibility of muddling through is very low. In the unlikely event that it happens, this is what it would look like.

Memories of the internecine civil war during World War II and fear of another destructive conflict would lead the two most numerous South Slav people—Serbs and Croats—to reach some political accommodation. A compromise that preserves Yugoslavia would include:

- Basic principles:
  - -No change in existing Republic borders.
  - -No change in Yugoslavia's existing international status.
  - -Mutually recognized sovereignty of each republic

- Confederal institutions:
  - -A single foreign ministry, to which diplomatic representatives would be accredited.
  - -A central military organization with a joint General Staff responsible for planning.
  - -A central bank, determining macroeconomic policy, a common currency,

- Powers reserved to republics.
  - -Veto over actions of the Confederal Authority.
  - -Control of internal security, including guarantee of minority rights.
  - -Operational control over some or all military units stationed on the republic's territory.
  - -Raising taxes and allocating funds to discharge mutually agreed confederal responsibilities.

Only the Serbs can open the door to a confederal Yugoslavia, and Serbia's leader, Slobodan Milosevic, holds the key. Some observers felt there are pressures on him to try. If he does not, he would give his opponents the leverage to remove him. The potential penalties of failure to compromise would be too great, in this view, for the peoples and leaders of Yugoslavia to forgo every effort to find a compromise.

—*Excerpts from the declassified* NIE: Prospects for Yugoslavia*, October 1990.*

BRAINSTORMING

An unconstrained group process designed to generate new ideas and concepts.

WHEN TO USE

Brainstorming is a widely used technique for stimulating new thinking and it can be applied to virtually all of the other structured analysis techniques as an aid to thinking. Typically, analytic will brainstorm when they begin a project to help generate a range of hypotheses about their issue.

Brainstorming, almost by definition, involves a group of analysts meeting to discuss a common challenge; a modest investment of time at the beginning or critical points of a project can take advantage of their different perspectives to help structure a problem. This group process allows others to build on an initial idea suggested by a member of the brainstorming session.

An individual analyst also can brainstorm to produce a wider range of ideas than a group might generate, without regard for other analysts' egos, opinions, or objections. However, an individual will not have the benefit of others' perspectives to help develop the ideas as fully. Moreover, an individual may have difficulty breaking free of his or her cognitive biases without the benefit of a diverse group.

VALUE ADDED

This technique can maximize creativity in the thinking process, force analysts to step outside their normal analytic mind-sets, and suspend their typical "good judgment" about the practicality of ideas or approaches. More generally, brainstorming allows analysts to see a wider range of factors that might bear on the topic than they would otherwise consider. Analysts typically censor out ideas that seem farfetched, poorly sourced, or seemingly irrelevant to the question at hand. Brainstorming gives permission to think more radically or "outside the box." In particular, it can spark new ideas, ensure a comprehensive look at a problem or issues, raise unknowns, and prevent premature consensus around a single hypothesis.

THE METHOD

Paradoxically, brainstorming should be a very structured process to be most productive. An unconstrained, informal discussion might produce some interesting ideas, but usually a more systematic process is the most effective way to break down mind-sets and produce new insights. In particular, the process involves a divergent thinking phase to generate and collect new ideas and insights, followed by a convergent phase in which ideas are grouped and organized around key concepts. Some of the simple rules to be followed include:

- Never censor an analyst's ideas no matter how unconventional they might sound.
- Rather find out what prompted the thought, as it might contain the seeds of an important connection between the topic and an unstated assumption.
- Give yourself enough time to do brainstorming correctly. It usually takes one hour to set the "rules" of the game, get the group comfortable, and exhaust the conventional wisdom on the topic. Only then will the truly creative ideas begin to emerge.
- Involve at least one "outsider" in the process—that is, someone who does not share the same educational background, culture, technical knowledge or mind-set as the core group but has some familiarity with the topic.

A two-phase, twelve-step, structured process is often used to get the most out of the brainstorming sessions:

Brainstorming and Divergent Thinking: Perspectives of an Experienced Practitioner

". . . First, leave rank at the door and focus on "a democracy of ideas." Thoughts from experts, senior officers, and supervisors are of course, valuable and welcome, but such experts are not permitted to cut off debate by citing their seniority. In fact, it pays to invite junior officers as well as senior ones who are not involved directly in working the issue under discussion. Some of the most creative ideas at brainstorming sessions frequently come from relatively junior people who can look at a problem with fresh perspective, or from senior ones who are not experts on the issue.

Second, make sure there is no official analytic line. One of the most significant blocks to new thinking is the presence of a long held analytic line that analysts—and even more so managers—are reluctant to change. Rather than trying to fit ideas into the framework of "what we've said before," analysts need to feel free to go wherever bits of the evidence and informed supposition take them. They must feel free to throw out seemingly strange but plausible ideas that might be based on historical precedent and instinct rather than on concrete information. Facilitators can stimulate this process by deliberately posing an alternative outcome to a problem that differs starkly from the accepted analysis or by proposing a contrary way to think about an issue.

Third, don't permit killer phrases like "that would not work" or "that could not happen" to be voiced out loud. Effective brainstorming starts with ideas and possibilities, not with practicalities and self-imposed obstacles to fresh perspectives. Force the group to get as wide a range of ideas out for discussion as possible. At some point, a set of ideas might be winnowed down and subject to tests of workability, but that comes later—not during brainstorming.

Fourth, keep the brainstorming session to no more than 90 minutes. There is no hard and fast rule, but somewhere between 60 and 90 minutes, the idea stream starts to dry up, people repeat themselves, and jokes replace creative ideas.

Fifth, record ideas in a visible way. Lots of people take notes at brainstorming sessions for their own use, and that is good. We have found it valuable to have someone jot down the ideas presented on large paste-a-note sheets that we put on the walls. This allows participants in brainstorming sessions to react to ideas generated earlier. Moreover, analysts are encouraged to participate in such exercises if they see their own ideas put down in writing. Having a notional record of brainstorming also helps the analyst who ends up writing a report based on the discussion. Ideas that may not be used in one report are invariably put to use later, so it is good to have a record of them . . ."

Divergent Thinking Phase:

- Distribute “Post-It” notes and pens or markers to all participants. Typically, 10-12 people works best.
- Pose the problem in terms of a “focal question.” Display it in one sentence on a large easel or whiteboard.
- Ask the group to write down responses to the question, using key words that will fit on the small “Post-It” note.
- Stick all the notes on a wall for all to see—treat all ideas the same.
- When a pause follows the initial flow of ideas, the group is reaching the end of their conventional thinking and the new divergent ideas are then likely to emerge.
- End the “collection stage” of the brainstorming after two or three pauses.

Convergent Thinking Phase:

- Ask the participants as a group to rearrange the notes on the wall according to their commonalities or similar concepts. No talking is permitted. Some notes may be moved several times as notes begin to cluster. Copying some notes is permitted to allow ideas to be included in more than one group.
- Select a word or phrase that characterizes each grouping or cluster once all the notes have been arranged.
- Identify any notes that do not easily fit with others and consider them either useless noise or the beginning of an idea that deserves further attention.
- Assess what the group has accomplished in terms of new ideas or concepts identified or new areas that need more work or further brainstorming.
- Instruct each participant to select one or two areas that deserve the most attention. Tabulate the votes.
- Set the brainstorming group’s priorities based on the voting and decide on the next steps for analysis.

OUTSIDE-IN THINKING

Used to identify the full range of basic forces, factors, and trends that would indirectly shape an issue.

WHEN TO USE

Analysts find this technique most useful at the conceptualization of an analytic project, when the goal is to identify all the critical, external factors that could influence how a particular situation will develop. It would work well for a group of analysts responsible for a range of functional and/or regional issues. When assembling a large database that must identify a number of information categories or database fields, this technique can aid in visualizing the entire set of categories that might be needed in a research effort. Often analysts realize only too late that some additional information categories will be needed and then must go back and review all previous files and recode the data. With a modest amount of effort, "Outside-in Thinking" can reduce the risk of missing important variables early in the analytic process.

VALUE ADDED

Most analysts spend their time concentrating on familiar factors within their field or analytic issue. That is, they think from the "inside"—namely, what they control—out to the broader world. Conversely, "thinking from the outside-in" begins by considering the external changes that might, over time, profoundly affect the analysts' own field or issue. This technique encourages analysts to get away from their immediate analytic tasks (the so-called "inbox") and think about their issues in a wider conceptual and contextual framework. By recasting the problem in much broader and fundamental terms, analysts are more likely to uncover additional factors, an important dynamic, or a relevant alternative hypothesis.

THE METHOD

The process begins by developing a generic description of the problem or the phenomenon under study. Then, analysts should:

- List all the key forces (social, technological, economic, environmental, and political) that could have an impact on the topic, but over which one can exert little influence (e.g., globalization, social stress, the Internet, or the global economy).
- Focus next on key factors over which an actor or policymaker can exert some influence. In the business world this might be the market size, customers, the competition, suppliers or partners; in the government domain it might include the policy actions or the behavior of allies or adversaries.
- Assess how each of these forces could affect the analytic problem.
- Determine whether these forces actually do have an impact on the particular issue based on the available evidence.

RED TEAM ANALYSIS

Models the behavior of an individual or group by trying to replicate how an adversary would think about an issue.

WHEN TO USE

Frequently, analysts face the challenge of forecasting how a foreign leader or decisionmaking group may behave when it is clear that there is a risk of falling into a "mirror-image" problem. That is, analysts can sometimes impute to a foreign actor the same motives, values, or understanding of an issue that they hold. Traditional analysis sometimes assumes that foreign leaders or groups will behave "rationally" and act as the analysts would if faced with the same threats or opportunities. History has shown that foreign leaders often respond differently to events because of different cultural, organizational, or personal experiences.

Red Team analysis tries to consciously place analysts in the same cultural, organizational, and personal setting ("putting them in their shoes") in which the target individual or group operates. Whereas analysts normally work from the position of the "blue" (friendly forces), a "red" team of analysts attempts to work in the environment of the hostile forces.

VALUE ADDED

Like Devil's Advocacy and Team A/Team B techniques, Red Team analysis is aimed at freeing the analyst from the prison of a well-developed mind-set; in this case, the analyst's own sense of rationality, cultural norms, and personal values. Whereas analysts usually operate as "observers" of a foreign adversary, the Red Team technique transforms the analyst into an "actor" operating within the adversary's culture and political milieu. This form of "role playing" is useful when trying to replicate the mind-set of authoritarian leaders, terrorist cells, or other non-Western groups that operate under very different codes of behavior or motivations. Often this technique can introduce new or different stimuli that might not have been factored into traditional analysis—such as the target's familial ties or the international political, economic, and military pressures felt by the individual. For example, Red Team participants might ask themselves: "What would my peers, family, or tribe expect me to do? Alternatively, a Red Team analyst might pose the question to his colleagues: "How do we perceive the external threats and opportunities?" Finally, the Red Team technique can factor into its analysis the way in which personal power and status might influence a target's behavior.

THE METHOD

On issues that lend themselves to Red Team analysis, a manager needs to build a team of experts with in-depth knowledge of the operating environment, the target's personality, and the style of thinking used. The team should be populated not just with those who understand the language, but also with people who might have experienced the culture, share the ethnic background, or have worked in a similar operational environment. Once established and separated from traditional analysis, the team members should:

- Put themselves in the adversary's circumstances and react to foreign stimuli as the target would.
- Develop a set of "first-person" questions that the adversary would ask, such as: "How would I perceive incoming information; what would be my personal concerns; or to whom would I look for an opinion?"
- Draft a set of policy papers in which the leader or group makes specific decisions, proposes recommendations, or lays out courses of actions. The more these papers reflect the cultural and personal norms of the target, the more they can offer a different perspective on the analytic problem.

A Red Team Perspective
Iran's Military Strategy Vis-a-vis the United States

". . . The United States and Israel may be contemplating military operations against Iran, as per recent media reports . . . A week-long combined air and ground maneuver has just concluded in five of the southern and western provinces of Iran, mesmerizing foreign observers, who have described as 'spectacular' the massive display of high-tech, mobile operations, including rapid-deployment forces relying on squadrons of helicopters, air lifts, missiles, as well as hundreds of tanks and tens of thousands of well-coordinated personnel using live munitions.

Learning from both the 2003 Iraq war and Iran's own previous experiences of the 1980-88 war with Iraq and the 1987-88 confrontation with US forces in the Persian Gulf, Iranians have focused on the merits of a fluid and complex defensive strategy that seeks to take advantage of certain weaknesses in the US military superpower while maximizing the precious few areas where they may have the upper hand, e.g.; numerical superiority in ground forces, guerrilla tactics, terrain, etc.

Any US attack on Iran will likely be met first and foremost by missile counter-attacks engulfing the southern Persian Gulf states playing host to US forces, as well as any other country—e.g., Azerbaijan, Iraq, or Turkey allowing their territory or airspace to be used against Iran. The rationale for this strategy is precisely to pre-warn Iran's neighbors of the dire consequences, with potential debilitating impacts on their economies for a long time, should they become accomplices of foreign invaders of Iran.

Another key element of Iran's strategy is to "increase the arch of crisis" in places such as Afghanistan and Iraq, where it has considerable influence, to undermine the United States' foothold in the region, hoping to create a counter-domino effect wherein instead of gaining inside Iran, the US would actually lose territory partly as a result of thinning its forces and military 'overreach.'

Iran's counter-psychological warfare, on the other hand, seeks to take advantage of the 'death-fearing' American soldiers who typically lack a strong motivation to fight wars not necessarily in defense of the homeland. A war with Iran would definitely require establishing the draft in the US, without which it could not possibly protect its flanks in Afghanistan and Iraq.

There is a sense of national-security siege in Iran these days, in light of a tightening "security belt" by the US benefiting from military bases in Iraq, Turkey, Azerbaijan, Uzbekistan, Tajikistan, Kyrgyzstan, as well as Kuwait, Saudi Arabia, Qatar, Bahrain, Oman, and the island-turned garrison of Diego Garcia. From Iran's vantage point, the US, having won the Cold War, has turned into a 'leviathan unhinged' capable of manipulating and subverting the rule of international law and the United Nations with impunity, thus requiring a sophisticated Iranian strategy of deterrence, that, in the words of certain Iranian media pundits, would even include the use of nuclear weapons . . ."

—Excerpts from Kaveh L. Afrasiabi (Tehran University), "How Iran Will Fight Back," cited in Asia Times Online Ltd., 2004.

Red Team analysis is not easy to conduct. It requires significant time to develop a team of qualified experts who can think like the adversary. The team has to distance itself from the normal analysis and work as though living in the target's world. Without a sophisticated understanding of the culture, operational environment, and personal histories of the foreign group, analysts will not be able to behave or think like the enemy. Analysts can never truly escape their own experiences and mind-sets, but this technique can at least prevent them from falling into "mirror-imaging" unconsciously.

The most novel feature of Red Team analysis is its presentation.

- The analysis is often in a "first person" format—that is, drafted as memos to or from a leader or group.
- Red Team analysis avoids the use of caveats or qualifications and assumes that the recipient understands that the paper is aimed more at provoking thought or challenging the conventional understanding of how an adversary thinks.
- Such papers are rarely coordinated among other experts and do not purport to represent the consensus view on an issue.

Red Team papers do not plot out all possible courses of action but seek to give a prediction based on the target's special personal, organizational, or cultural experiences.

ALTERNATIVE FUTURES ANALYSIS

Systematically explores multiple ways a situation can develop when there is high complexity and uncertainty.

WHEN TO USE

Alternative futures analysis (often referred to as "scenarios") is most useful when a situation is viewed as too complex or the outcomes as too uncertain to trust a single outcome assessment. First, analysts must recognize that there is high uncertainty surrounding the topic in question. Second, they, and often their customers, recognize that they need to consider a wide range of factors that might bear on the question. And third, they are prepared to explore a range of outcomes and are not wedded to any preconceived result. Depending on how elaborate the futures project, the effort can amount to considerable investment in time, analytic resources, and money. A team of analysts can spend several hours or days organizing, brainstorming, and developing multiple futures; alternatively, a larger-scale effort can require preparing a multi-day workshop that brings together participants (including outside experts). Such an undertaking often demands the special skills of trained scenario-development facilitators and conferencing facilities.

This technique is a sharp contrast to contrarian techniques, which try to challenge the analysts' high confidence and relative certitude about an event or trend. Instead, multiple futures development is a divergent thinking technique that tries to use the complexity and uncertainty of a situation to describe multiple outcomes or futures that the analyst and policymaker should consider, rather than to predict one outcome.

VALUE ADDED

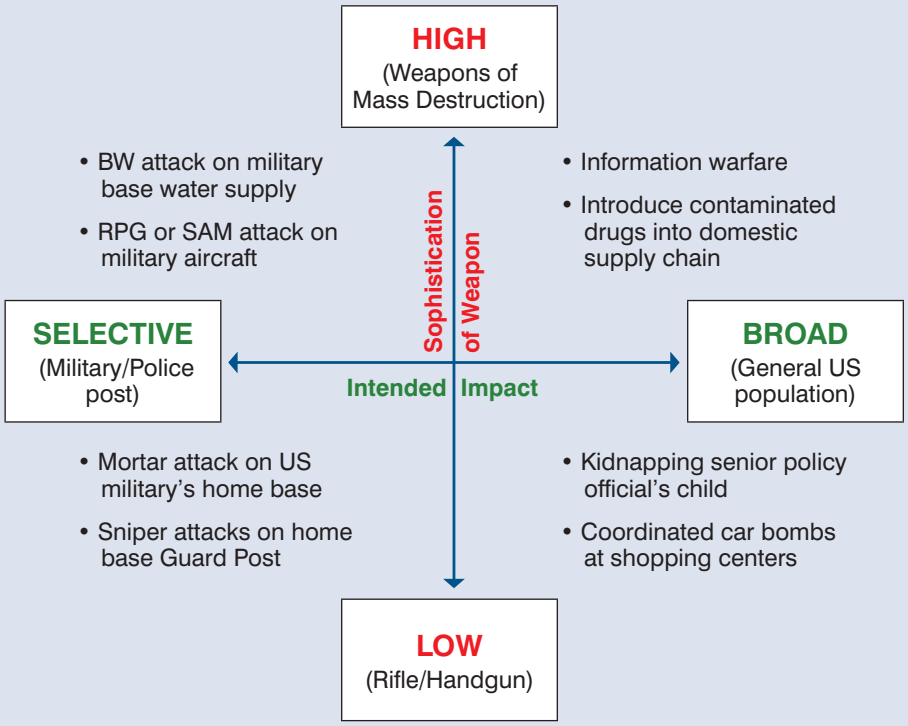
Alternative futures analysis is extremely useful in highly ambiguous situations, when analysts confront not only a lot of "known unknowns" but also "unknown unknowns." What this means is that analysts recognize that there are factors, forces, and dynamics among key actors that are difficult to identify without the use of some structured technique that can model how they would interact or behave. As the outcomes are not known prior to the futures exercise, analysts must be prepared for the unexpected and willing to engage in a more free-wheeling exchange of views than typically occurs in order to "imagine the future." Given the time and resources involved, scenario analysis is best reserved for situations that could potentially pose grave threats or otherwise have significant consequences.

From past experience, analysts have found that involving policymakers in the alternative futures exercise is the most effective way to communicate the results of this exploration of alternative outcomes and sensitize them to key uncertainties. Most participants find the process of developing such scenarios as useful as any finished product that attempts to capture the results of the exercise. Analysts and policymakers can benefit from this technique in several ways:

- It provides an effective means of weighing multiple unknown or unknowable factors and presenting a set of plausible outcomes.
- It can help to bound a problem by identifying plausible combinations of uncertain factors.
- It provides a broader analytic framework for calculating the costs, risks, and opportunities presented to policymakers by different outcomes.

> *"The future is plural."*
>
> —Peter Schwartz, author of *The Art of the Long View* and a widely acclaimed scenario developer.

Hypothetical Threats to the Homeland: Using Spectrums to Define Potential Targets



A Futures Exercise. The graphic captures four potential futures to understand how foreign insurgents might carry out an attack on the United States. A brainstorming exercise helped analysts identify two key uncertainties (the sophistication of weapons used by the insurgents and the intended impact of the attack) and arrayed these factors on a graph as the "x" and "y" axes. The four resulting quadrants in the 2 x 2 matrix allowed analysts to visualize potential targets from the various combinations (low to high sophistication of weapons and selective to broad intended impact of an attack). For example, if a group possessed highly sophisticated weapons and intended a broad attack on the United States, potential targets could include computer networks and domestic drug supplies. Having filled in a quadrant, analysts can then turn to devising likely indicators or signposts of such a future.

- It aids analysts and policymakers in anticipating what otherwise would be surprising developments by forcing them to challenge assumptions and consider possible "wild cards" or discontinuous events.

- It generates indicators to monitor for signs that a particular future is becoming more or less likely, so that policies can be reassessed.

THE METHOD

Although there are a variety of ways to develop alternative futures, the most common approach used in both the public and private sectors involves the following steps:

- Develop the "focal issue" by systematically interviewing experts and officials who are examining the general topic.

- Convene a group of experts (both internal and external) to brainstorm about the forces and factors that could affect the focal issue.

- Select by consensus the two most critical and uncertain forces and convert these into axes or continua with the most relevant endpoints assigned.

- Establish the most relevant endpoints for each factor; e.g., if economic growth were the most critical, uncertain force, the endpoints could be "fast" and "slow" or "transformative" and "stabilizing" depending on the type of issue addressed.

- Form a futures matrix by crossing the two chosen axes. The four resulting quadrants provide the basis for characterizing alternative future worlds.

- Generate colorful stories that describe these futures and how they could plausibly come about. Signposts or indicators can then be developed.

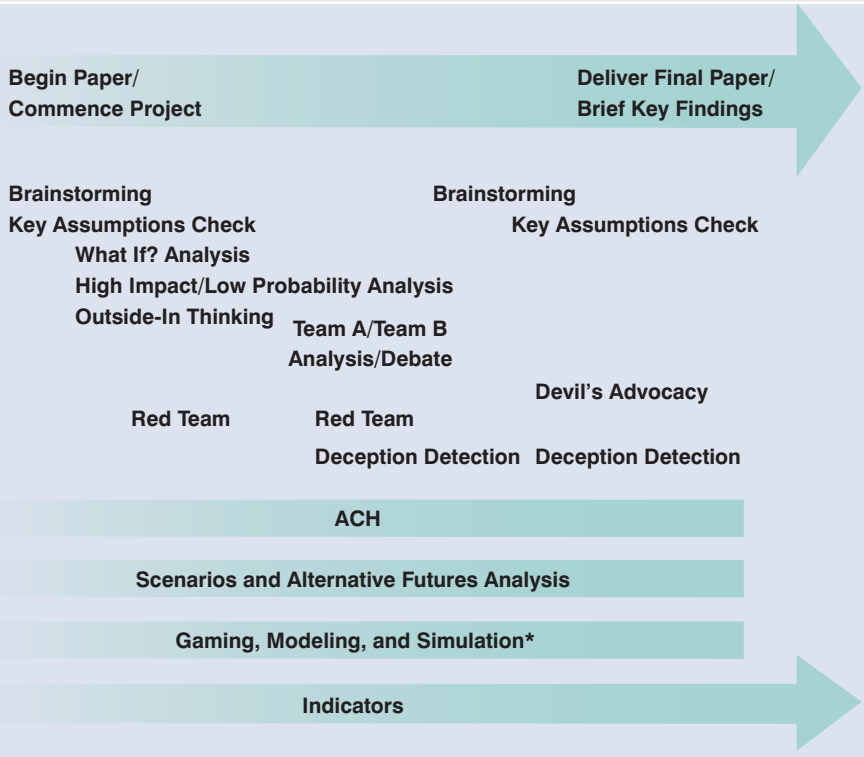
Participants, especially policymakers, can then consider how current decisions or strategies would fare in each of the four worlds and identify alternative policies that might work better either across all the futures or in specific ones. By anticipating alternative outcomes, policymakers have a better chance of either devising strategies flexible enough to accommodate multiple outcomes or of being prepared and agile in the face of change.

These structured analytic techniques can be used in a variety of ways when analysts begin a new assessment. Some can be used equally effectively at multiple points in the process and can promote an analyst's ability to keep an open mind, to consider multiple—including highly unlikely—hypotheses, to challenge conventional wisdom, and to assess the impact of important information gaps or deception on analytic judgments and confidence levels. The Timeline for Using Analytic Techniques provides some thoughts on when to use one or more of them during the course of an analyst's research and writing.

Starting Out

At the beginning of an analytic project, analysts are always wise to consider brainstorming and assumptions checks to insure that important factors are not being missed or taken for granted. Similarly, outside-in-thinking can sometimes put an analytic project into a broader international context, in which factors outside the lead analyst's area of responsibility might impact on his or her analytic judgments. For instance, economic assumptions about the price of oil might be key to a regional political analyst's understanding the prospects for political stability in an oil-exporting

A Timeline for Using Analytic Techniques Throughout an Analytic Project



*Gaming, Modeling, and Simulation are among the more sophisticated techniques taught in a more advanced analytic methods course and usually require substantial commitments of analyst time and corporate resources.

country or a underdeveloped country entirely dependent on expensive energy imports. A High Impact/Low Probability assessment can also sensitize analysts early on to the significance of dramatic events that might affect their analytic lines.

Some techniques like Indicators and Signposts or Analysis of Competing Hypotheses (ACH) can be useful throughout a project and revisited periodically as new information is absorbed and analyzed. ACH, in particular, is a good tool to use throughout a project to prevent premature closure and to highlight evidence that is most "discriminating" in making an analytic argument. Alternative Futures analysis is similarly useful at the beginning of a project, but can amount to the structure for the entire project.

Hypothesis Testing

As an analytic project takes shape, and hypotheses are being formed about the key intelligence question, it can be appropriate to use one or another contrarian technique to challenge the conventional analytic line that is being developed. If the assessment contains strong judgments about an adversary's behavior, then challenging this view with a "Red Team" effort might be a good corrective to too much of a rational actor approach. Also, a review of intelligence gaps at this juncture can also help give the analysts a better degree of confidence in the information base and judgments reached in the assessment.

A Final Check

As the assessment is being finalized, it can still be useful to review key assumptions as a sanity check on the underlying logic of the analysis. A brainstorming session also may be helpful to insure that no plausible hypothesis has been dismissed or left unaddressed. If a firm consensus has formed around an analytic line and has not been seriously questioned in some time, then a Devil's Advocacy exercise could be useful. Analysts might also use a final review to decide if they have identified a list of key indicators for future developments. This can be an important guide to include in the assessment as a way to track future developments and monitor whether the analytic judgments reached are being realized or in need of revision.

Graham Allison, *Essence of Decision*: *Explaining the Cuban Missile Crisis*: Examines the Kennedy Administration's decisionmaking style from alternative perspectives of the "rational actor," "organizational actor," and "bureaucratic politics" models.

Max Bazerman and Michael D. Watkins, *Predictable Surprises: The Disasters You Should Have Seen Coming and How To Prevent Them*. Examines the cognitive, organizational and political causes of some predictable surprises and outlines steps to overcome them.

Richard Betts, *Surprise Attack: Lessons for Defense Planning*. Explains why surprise attacks historically have succeeded and argues that the US needs strategies for avoiding surprise or at least reducing their consequences. Uses examples from World War II, Korea, and the Middle East.

Josh Epstein and Rob Axtell, *Sugarscape: Creating Artificial Societies from the Ground Up*. Develops a very simple agent-based model of a silicon-based society and then does simulations of various social, economic and political phenomena, including conflict.

Malcolm Gladwell, *The Tipping Point: How Little Things Can Make a Big Difference*. Examines how social trends, ideas, and products emerge from nowhere and take hold.

Cynthia M. Grabo, *Anticipating Surprises: Analysis for Strategic Warning.* Examines distinctive ingredients of the analytical method of intelligence and suggests ways of improving warning assessments.

Richards J. Heuer, Jr., *The Psychology of Intelligence Analysis*. Examines the impediments to good analysis and provides techniques for overcoming mind-sets and cognitive biases.

Barry Hughes, *International Futures*. Develops scenarios for international relations using a simulation tool contained in a CD ROM in the back jacket.

Robert Jervis, *Perception and Misperception in International Politics*. Examines how policymakers learn from history, perceive complexity, and form and change their beliefs.

Gary Klein, *Intuition At Work*. Shows how developing one's intuition can improve your analytic skills and that it is a "learnable" technique.

Richard E. Neustadt and Ernest R. May, *Thinking in Time: The Uses of History for Decisionmakers*. Uses case study methods to identify the perils of historical analogies and recommends identifying what is "known, unclear and presumed."

Peter Schwartz, *The Art of the Long View: Planning for the Future in an Uncertain World*. Explains the "scenaric" approach pioneered at Royal Dutch Shell and argues for making strategic decisions that will be sound for "all plausible futures."

James Surowiecki, *The Wisdom of Crowds*. Argues that diversity and independence of even non-expert individuals in groups, properly organized, can reach more accurate forecasts than individual experts.

M. Mitchell Waldrop, *Complexity: The Emerging Science at the Edge of Disorder and Chaos*. Introduces the literature of complex systems and suggests why forecasting anything complicated is so difficult.

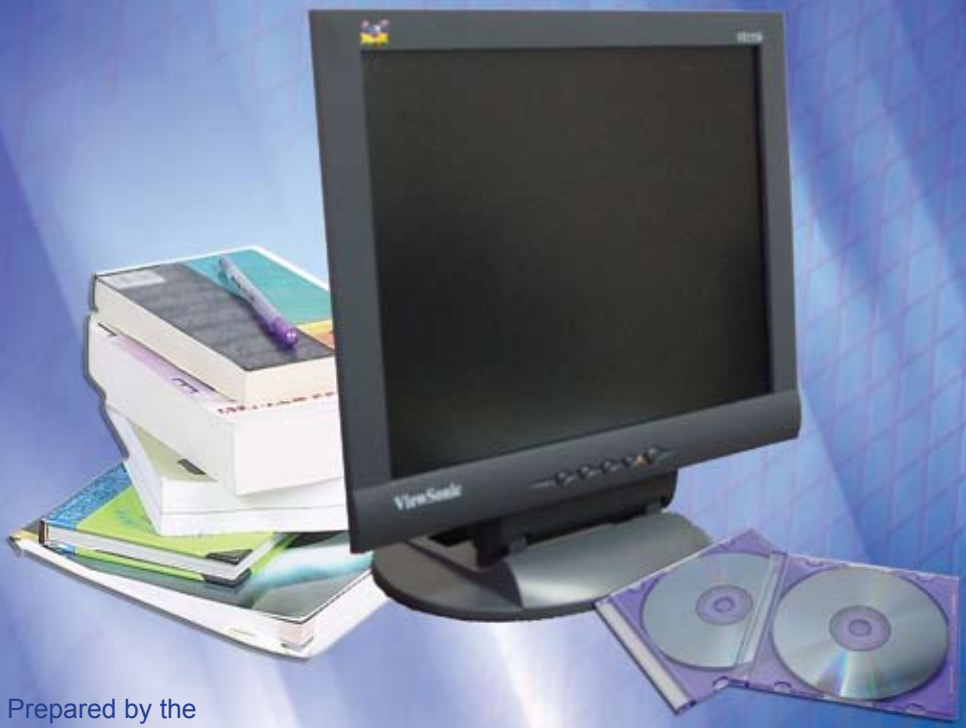
Global Justice Information Sharing Initiative

United States Department of Justice

Analyst Toolbox

A Toolbox for the Intelligence Analyst



Prepared by the
U.S. Department of Justice's Global Justice Information Sharing Initiative Intelligence Working Group

About Global

The U.S. Department of Justice's Global Justice Information Sharing Initiative (Global) serves as a Federal Advisory Committee to the U.S. Attorney General on critical justice information sharing initiatives. Global promotes standards-based electronic information exchange to provide justice and public safety communities with timely, accurate, complete, and accessible information in a secure and trusted environment. Global is administered by the U.S. Department of Justice, Office of Justice Programs, Bureau of Justice Assistance.

This project was supported by Grant No. 2007-NC-BX-K001 awarded by the Bureau of Justice Assistance, in collaboration with the U.S. Department of Justice's Global Justice Information Sharing Initiative. The Bureau of Justice Assistance is a component of the Office of Justice Programs, which also includes the Bureau of Justice Statistics, the National Institute of Justice, the Office of Juvenile Justice and Delinquency Prevention, the SMART Office, and the Office for Victims of Crime. Points of view or opinions in this document are those of the author and do not represent the official position or policies of the U.S. Department of Justice.

Introduction and Background

There is a wide range of software available on the market to support intelligence analysis. In order to meet the challenges facing law enforcement today, it is important that intelligence professionals be equipped with the right tools to effectively and efficiently perform their duties and produce meaningful and useful intelligence products. The tools examined in this document represent the basic toolbox that the intelligence analyst will need to provide the vital intelligence service that is expected in today's law enforcement environment.

The *National Criminal Intelligence Sharing Plan* (NCISP)[1]—endorsed by the U.S. Department of Justice (DOJ), the U.S. Department of Homeland Security (DHS), and many different law enforcement organizations—contains 28 recommendations for local, state, tribal, and federal law enforcement agencies to implement in order to improve the quality of criminal intelligence in the United States. Two of the recommendations of the NCISP address the need to properly equip those persons involved in intelligence analysis:

- Recommendation 12: The International Association of Law Enforcement Intelligence Analysts (IALEIA) should develop, on behalf of the CICC (Criminal Intelligence Coordinating Council), minimum standards for intelligence analysis to ensure intelligence products are accurate, timely, factual, and relevant and recommend implementing policy and/or action(s). Law enforcement agencies should adopt these standards as soon as developed and approved by the CICC.
- Recommendation 28: The CICC, in conjunction with the Office of Justice Programs (OJP) and the connected sensitive but unclassified systems, shall develop an acquisition mechanism or centralized site that will enable law enforcement agencies to access shared data visualization and analytic tools. The CICC shall identify analytical products that are recommended for use by law enforcement agencies

1 Available at www.it.ojp.gov/documents/NCISP_Plan.pdf.

in order to maximize resources when performing intelligence functions, as well as a resource list of current users of the products.

Pursuant to Recommendation 12, IALEIA developed the *Law Enforcement Analytic Standards* booklet.[2] This booklet provides minimum standards for intelligence analysis to ensure that intelligence products are accurate, timely, factual, and relevant. These standards were approved by DOJ's Global Justice Information Sharing Initiative (Global) Advisory Committee in September 2004. Standard 16 of the *Law Enforcement Analytic Standards* states that "Analyses shall utilize the best and most current computerized visualization and analytic tools available to the analyst."

In order to provide law enforcement decision makers with as much information as possible concerning the tools available to the analysis process, the Global Intelligence Working Group (GIWG) tasked the Connectivity/Systems Committee to develop a list of tools to fulfill the needs expressed in NCISP Recommendation 28. To begin the process, a survey was conducted among randomly selected law enforcement analytic practitioners to determine a baseline of needed tools to adequately perform the analyst function.[3]

Another step in the process of developing tools to aid in the analysis process was the coordination with the Office of National Drug Control Policy to modify its secure Technology Toolbox for police Web-based collaboration programs to accommodate discussion forums for analytical software. This provides a secure mechanism for law enforcement analysts to discuss "how to" issues concerning these tools. Additionally, administrators can compare various intelligence products to gauge the effectiveness of the tools and determine whether they meet the needs of the agency. The Technology Toolbox can be reached via RISSNET™.

The *Analyst Toolbox* list represents the results of extensive Web-based, open source research and the collection of systems currently utilized by local, state, tribal, and federal law enforcement agencies.

2 Available at www.it.ojp.gov/documents/law_enforcement_analytic_standards.pdf.
3 The results of the survey are attached as Appendix A.

Analyst Toolbox

Word Processing

Purpose: To produce text documents, including bulletins, fact sheets, investigative summaries, and analytical reports. Analytic products should include a written report of some length and format that can be produced utilizing word processing software. In some instances, the only product of an analysis will be a written report.

Uses: Word processing software includes various formatting tools, such as footnoting, header and footer annotations, mailing labels, and correspondence formatting. This software also enables objects (photographs, graphics, tables, etc.) to be embedded in documents. Word processing software may also include editing and change tracking features for documents being modified by more than one individual.

Spreadsheet

Purpose: To organize numerical data in a column-and-row format for summarization and comparison of data and data charting.

Uses: Spreadsheets are capable of performing calculations and basic statistical computations, searches, defined filtering, and sorting of data. They are ideal for financial data storage and collation. Data can be entered by an operator or imported from files of similar structure. Additional capabilities of this tool should include the ability to generate graphs and tables to visualize data. Drawing toolbars may be used to create rudimentary link charts and flowcharts.

Relational Database

Purpose: To organize data in relation to other data in a format of records and fields arranged into several tables in order to determine commonalities and relationships among data. The relational database tool can also be used for record keeping.

Uses: Relational database software allows the option of records/fields within a database to be related to other fields (e.g., incident name, time, date, gist, and reported by). Records can be associated with other records by any of the fields (a query for records for a particular date will bring up all records associated with that date; e.g., a query for records reported by Officer Jones will retrieve all incidents reported by Jones). Likewise, tables can be related to each other through queries that connect similar fields and reduce data entry and repetition. A relational database also serves as an information management tool. User interface can be via simple forms through which data can be entered and fed directly into the database.

Mapping/Geographic Information System (GIS)

Purpose: To display geographic data using points or shapes corresponding to specific locations or areas on a map to aid in crime mapping and strategic intelligence charting.

Uses: Mapping/GIS software can aid in mapping and in the analysis of data points or areas related to crime or other patterns (dates, times, hot spots of activity, buffer zones). This software can also be used to look at patterns of movement relating to crime to delineate "hunting zones" and reduce the number of leads in predatory crimes.

Public Information Database Resources

Purpose: To provide access to compiled public data sources with one comprehensive search.

Uses: Public information records usually include personal information (address, phone number, date of birth) and asset information (real estate, vehicle, businesses). These types of databases are not considered the primary data source but are a compilation of information from other sources; therefore, the information should be verified at the primary source of the information. Law enforcement agencies may have direct access to these databases, or agencies may access this type of information through the Regional Information Sharing Systems® (RISS), Financial Crimes Enforcement Network (FinCEN), National White Collar Crime Center (NW3C), or High Intensity Drug Trafficking Areas (HIDTA).

Presentation Software

Purpose: To produce professional-looking slide show presentations, with the capability to incorporate text, photographs, graphics, and animation.

Uses: Presentation software provides not only slides but also handouts and presentation outlines that may aid in oral intelligence briefings. This tool can be used to provide a visual summary of pertinent information relating to the investigation or topic being discussed.

Graphics Software

Purpose: To illustrate concepts or conclusions using graphic arts.

Uses: Graphics software allows for cutting and pasting of information into other applications for projects beyond the graphics capability of word processing and spreadsheet software, thereby providing a complete and detailed representation of the applicable data.

PDF File Creation Software

Purpose: To allow the creation of PDF format files. PDF files can be viewed and printed on any operating system (Mac OS X®, Microsoft® Windows®, UNIX®), thereby facilitating the sharing of information.

Uses: PDF files look exactly like original documents and preserve source file information—including text, drawings, 3D, full-color graphics, and photos—regardless of the application used to create them. PDF files can also support full-text searches to locate words and phrases. This software can also be utilized to create electronic documents from paper originals.

Statistical Analysis Software

Purpose: To analyze large amounts of data to identify trends.

Uses: This software enables the user to create descriptive statistics, which in turn allows for the summarization and analysis of qualitative and quantitative data, using calculations such as frequency, percent change, mean, median, mode, and measures of variance (SD and SE). Inferential statistics are used for random sampling of populations (as in a survey) and allow the user to inferentially apply the results to the population from which the sample was drawn.

Publishing Software

Purpose: To produce professional-looking publications, such as newsletters or bulletins.

Uses: Publishing software enables the user to create publications to be distributed on a broad scale. Intelligence that is to be disseminated should be converted into a format similar to PDF to ensure that the quality of the document is not altered.

Communications/Telephone (Toll) Record Software

Purpose: To organize structured information collected from telephone billing systems (including cellular phones), pen registers, and dialed number recorders for analysis.

Uses: Communications/telephone records software aids in the analysis of communication and telephone information, including source or destination of a call; the times of calls; and the dates, frequency, sequence, patterns, and duration of calls to/from one or many telephones. With advancements in communications technologies—such as e-mail, instant messaging (IM), paging, Voice over Internet Protocol (VoIP), and direct connect technologies—software packages should be capable of dealing with nontraditional communications data elements, such as Internet Protocol (IP) addresses, e-mail addresses, direct connect private identification numbers, and IM account numbers and/or screen names.

Timeline/Flowcharting

Purpose: To display chronological events in an easy-to-understand format.

Uses: Timeline/flowcharting can support tactical or strategic planning, as well as investigations. Timeline software tools can visually show the order of events for an identified or suspected crime. Flowcharting can visually demonstrate the flow of goods within a criminal enterprise. Timeline/flowcharting can also serve administrative purposes, such as visual project tracking.

Link Analysis

Purpose: To link associated information from a structured data source and display the links between entities in a graphic display. Also useful for documenting data sources and can help find the links in a large, complex data set. This type of software can also include a timeline or flowcharting capability.

Uses: Link analysis software can visually show relationships, including association analysis and hierarchical relationships (e.g., organized crime hierarchies).

Data Mining/Text Mining

Purpose: To automate the process of determining patterns and relationships in extremely large volumes of information (either statistical or in text) too large for an individual to manage.

Uses: Data mining/text mining tools can assist in complex case management where there may be multiple targets, victims, and pieces of information related to the case. These types of tools aid in efficiently analyzing large amounts of data.

Data Visualization

Purpose: To automatically display information in formats such as graphs and pie charts. This capability can sometimes be part of a larger software application, such as spreadsheet software.

Uses: Data visualization software displays the relationships and findings in an easy-to-read format, such as link charts, flowcharts, or telephone toll-analysis charts.

Investigative Case Management

Purpose: To track investigations and leads and activities conducted in support of investigations in order to preserve a record for investigative and prosecutorial purposes, as well as to manage work flow of investigators and analysts.

Uses: Investigative case management tools provide a central repository for all information relating to a case. Users may query the system to determine whether subjects have previously been identified and current case status. This tool can also provide information and reports regarding strategic planning for law enforcement executives.

Conclusion

Each organization will have to determine the specific vendor to provide the tools listed in this report. It is important when examining these products that interoperability be considered. In order to connect the dots, law enforcement analysts must have a basic set of tools that provide the services they need and can easily communicate with each other.

Appendix A

Results of Analyst Survey to Determine Tools Needed by Analysts

November 2005

I. Hardware

A. Computer with sufficient processing speed and hard drive capability to run high-end programs and adequate data storage/memory servers
   1. CD and DVD Burner capability
   2. Backup equipment
   3. Video capture capability
   4. Laptops if fieldwork is required

B. Printers
   1. Laser for high-speed black and white with capability of printing up to 11" x 17" charts and documents
   2. Color printer with capability of printing up to 11" x 17" charts and documents
   3. Graphics plotter capable of printing large charts

C. Document scanner with auto feed and optical character recognition (OCR) software

D. Digital camera(s) (5-megapixel) for surveillance, target photos, and postseizure analysis

E. Digital video camera(s)

F. Facsimile machine

G. Color copier

H. Statistical calculator

I. Projection equipment

J. Television with cable or satellite access

II. Installed Software

A. Word processing program

B. Spreadsheet program

C. Relational database

D. Presentation software to include photo manipulation/enhancement

E. Internet browser

F. Flowcharting software

G. Link analysis software
H. Database reporting/visualization software
I. Mapping software
J. Photo enhancement software
K. E-mail program to include interoffice with ability to calendar/task
L. Desktop search engine for local and network drives
M. Telephone analysis software
N. Portable Document Format (PDF) creation software
O. Security software
    1. Virus blockers
    2. Internet restriction
    3. Firewall
    4. Smart Pass or other encryption software
P. Publication software
Q. Statistical analysis software
R. Data mining/text mining software

III. Access to Systems and Databases

A. Agency records management system
B. Agency intelligence system
C. Direct unfiltered Internet connection
D. State crime information system
E. National crime information system
F. State driver's license database
G. Commercial databases containing personally identifying information
H. Regional Information Sharing Systems (RISS)
I. Law Enforcement Online (LEO)
J. Homeland Security Information Network (HSIN)
K. Telephone database
L. Jail management databases
M. Financial Crimes Enforcement Network (FinCEN)
N. Immigration databases
O. State wage and hour database
P. State sex offender registries
Q. Crime-specific listservs
R. Really Simple Syndication (RSS) readers
S. Intelligence center databases (state, HIDTA, EPIC, NDIC, etc.)
T. State corrections/probation databases
U. Juvenile justice databases
V. Wireless Internet access
W. Cellular telephone and PDA

INTELLIGENCE ANALYSIS IN THEATER JOINT INTELLIGENCE CENTERS: AN EXPERIMENT IN APPLYING STRUCTURED METHODS

Occasional Paper Number Seven

The Joint Military Intelligence College supports and encourages research on intelligence issues that distills lessons and improves support to policy-level and operational consumers

This series of Occasional Papers presents the work of faculty, students and others whose research on intelligence issues is supported or otherwise encouraged by the Joint Military Intelligence College through its Office of Applied Research. Occasional papers are distributed to Department of Defense schools and to the Intelligence Community, and additional copies of unclassified papers are available through the National Technical Information Service <*www.ntis.gov*>; copies of selected papers are also available through the U.S. Government Printing Office <*www.gpo.gov*>.

Proposed manuscripts for these papers are submitted for consideration to the Applied Research Editorial Board. Papers undergo review by senior officials in Defense, Intelligence and occasionally civilian academic or business communities.

Occasional Paper Number Seven

INTELLIGENCE ANALYSIS IN THEATER JOINT INTELLIGENCE CENTERS: AN EXPERIMENT IN APPLYING STRUCTURED METHODS

By MSgt Robert D. Folker, Jr. (USAF)

INTELLIGENCE ANALYSIS IN THEATER JOINT INTELLIGENCE CENTERS: AN EXPERIMENT IN APPLYING STRUCTURED METHODS

Preface

In clear, articulate, unmistakable language, Master Sergeant Folker's learned thesis sets forth the key opposing arguments in the long-standing controversy over the role of structuring in intelligence analysis. The controversy is largely one-sided, because proponents of intuitive analysis see no purpose in debating the issue, as they are completely satisfied with the status quo. It is only the structuring enthusiasts who see a need for drastic change in the way analysis is conducted. Because, as Folker points out, supporters of the status quo include not only most analysts but most commanders as well, the structuring enthusiasts have never made progress in reforming the other side. And they won't make any progress until the superiority of structured analysis over intuitive analysis is proved, which Folker has taken a first giant step in doing.

And it is precisely on this point that Folker challenges the Intelligence Community—indeed the entire U.S. government and the private sector as well—to design and conduct reliable tests to demonstrate which analytic approach is superior: structured or intuitive. Given the wide range of available structuring techniques, each one should be tested in competition with intuition.

There are many myths prevalent in the analytic community, public and private, concerning structured analysis: It is time-consuming and overly complicated; it eliminates the indispensable role of intuition; it involves numbers and arcane formulae that render analysis mechanical and devoid of creative solutions; and so on. Tests like Folker's will surely dispose of these myths and demonstrate the immense value and power of structuring.

His thesis, moreover, should encourage students to undertake research experiments that challenge long-held beliefs and test new theories of military interest. JMIC students are especially well placed to conduct thoughtful, creative research because they bring to this scholarly environment a rich mixture of background and viewpoints, and because they remain vitally involved in the business of wringing meaning from a great variety of intelligence information.

Morgan D. Jones
Former intelligence analyst, supervisor and trainer, Central Intelligence Agency

INTELLIGENCE ANALYSIS IN THEATER JOINT INTELLIGENCE CENTERS: AN EXPERIMENT IN APPLYING STRUCTURED METHODS

Foreword

A growing number of JMIC students have begun to incorporate replicable research design into their theses. This distillation of Master Sergeant Folker's thesis shows how fruitful this approach can be. By taking advantage of on-site research funds available from the College, he managed, in brief visits to four Unified Command Joint Intelligence Centers, to carry out a controlled experiment to measure the impact of analyst familiarity with and use of one structured analytic technique — hypothesis testing. His findings, if corroborated by follow-on studies, could have a substantial impact on Intelligence Community analytical practices, and even some influence on how senior policy officials react to analytical products. Managers of analytical personnel might also note that structured methods would appear, from this study of non-specialized joint intelligence center analysts, to be useful to specialized analysts who may be required to move beyond their areas of deep expertise to cover new or unfamiliar assignments.

Of equal importance with his findings is MSgt Folker's documentation of applied field research procedures. His subsequent recommendations for follow-on research illustrate the close relationship between doing research and contributing to the corporate learning environment. The Editor welcomes other students to contribute the story of their unique discoveries about the intelligence profession to this series of Occasional Papers.

This paper benefited from reviews by a panel of JMIC faculty, the Director of Research of the Defense Intelligence Agency's Directorate of Intelligence, and by Morgan D. Jones, founder of Analytic Prowess, L.L.C. of Montclair, Virginia.

Russell G. Swenson, Editor and Director, Office of Applied Research,

INTELLIGENCE ANALYSIS IN THEATER JOINT INTELLIGENCE CENTERS: AN EXPERIMENT IN APPLYING STRUCTURED METHODS

Exploiting structured methodologies compels the intelligence analyst to analyze the intelligence problem at hand and distinguishes analytical endeavors from office administration.

—The author

PREAMBLE

A debate exists between those who prefer to think of intelligence analysis as an art form and those who would highlight the value of a structured, scientific approach to the assessment of intelligence problems. Analytical approaches to intelligence problems can be divided into two overlapping categories—qualitative and quantitative. Qualitative analysis attempts to answer questions or solve problems that are not easily broken down into quantifiable variables. Qualitative analysis is therefore most often used in political, military, and warning intelligence. Quantitative analysis, which uses variables that are more easily measured, generally attempts to solve scientific or technical intelligence problems. Of the two, qualitative intelligence analysis, if performed carefully, arguably provides the information most useful to national policymakers.[1]

A small number of analysts occasionally apply structured methods to qualitative intelligence analysis, but the traditional approach to solve qualitative intelligence problems is non-structured.[2] Surprisingly, no research known to this author has adequately examined whether exploiting structured methodologies will improve qualitative intelligence analysis.

Intelligence analysts who do use non-structured methods for qualitative analysis argue that structured methods too narrowly define a problem and ignore factors that cannot be measured. They assert that their intuitive approach produces superior results. For their part, analysts who employ structured methods for qualitative analysis intuitively believe that structured methods ensure sounder, more comprehensive, and accurate findings.[3] However, no empirical evidence is available to support either belief.

---

[1] Richard K. Betts, "Intelligence for Policymaking," *Washington Quarterly 3*, no. 3 (Summer 1980): 119.

[2] James D. Hammond, *So You Want to Be an Intelligence Analyst?* Research Paper (Washington, DC: Defense Intelligence College, October 1983), 10.

[3] Capt. William S. Brei (USAF), *Getting Intelligence Right: The Power of Logical Procedure*, Occasional Paper Number Two (Washington, DC: JMIC, 1996), 1-2.

The author conducted a controlled experiment among a small sample of non-specialized analysts at four Unified Command joint intelligence centers to test the effect of applying a structured method to the qualitative analysis of an intelligence problem. Only tentative conclusions can be drawn from the findings in this limited experiment, but the results, if corroborated, have some profound implications for Intelligence Community analysts and their managers.

In brief, the author found that analysts who apply a structured method—hypothesis testing, in this case—to an intelligence problem, outperform those who rely on "analysis-as-art," or the intuitive approach. The modest character of this experiment, and of this finding, clearly calls for follow-on research, but this study at least shows that intelligence value may be added to information by investing some pointed time and effort in analysis, rather than expecting such value to arise as a by-product of "normal" office activity.

THE RESEARCH PROBLEM

Because the Intelligence Community has used technology to increase its ability to collect information, intelligence analysts face an ever-increasing stream of intelligence data.[4] But the Community has not made similar improvements in its analytical capability, and intelligence analysts are not exploiting all of the analytical methodologies available to them.[5] Perhaps in part because intelligence analysts lack familiarity with the proper analytical tools, they are being overwhelmed by the amount of information they are expected to analyze, contributing to "analysis paralysis."[6] Congress is well aware of this phenomenon, and has raised the issue publicly.[7]

A Research Question

A variety of structured methodologies is available to help the intelligence analyst solve qualitative problems,[8] but most analysts display an inability or unwillingness to exploit them.[9] Most people instinctively prefer intuitive, non-structured approaches over structured methodologies. Moreover, identifying all relevant qualitative variables in any

problem is difficult, and quantifying them is daunting. The bottom line: Most analysts prefer a subjective approach.[10] Can intelligence analysts, specifically those conducting analysis in the "softer" sciences such as political intelligence, improve the quality of their analysis by better exploiting structured methodologies? Comparing the analytical results of structured methods with the analytical results derived from traditional non-structured practices used by intelligence analysts should provide valuable insights into improving qualitative intelligence analysis. The need for such an experiment has been clearly identified by a number of specialists.[11]

Improvement in qualitative intelligence analysis has been a goal of long standing in the Intelligence Community, but most attempts to improve the process have ignored analysis and focused on restructuring intelligence organization and providing additional training in non-analytical subjects. The U.S. Commission on the Roles and Capabilities of the United States Intelligence Community determined that too few resources are dedicated to all-source analysis, and even fewer resources are obligated to developing and maintaining analytical expertise.[12] Currently, only six percent of the intelligence budget authorized by the U.S. Congress is spent on analysis.[13] The House of Representative's Permanent Select Committee on Intelligence concluded that "[a]nalytical pitfalls have been recognized in post mortems and other studies of past warning situations, and limited organizational and training efforts have been undertaken in response."[14]

A Record of Analytic Failures

Although organizational restructuring may be of some benefit to the Intelligence Community, the root cause of many critical intelligence failures has been analytical failure. "Failure to predict the North Korean invasion in 1950 was a failure of analysis at higher echelons. ... No analyses accompanied this raw data."[15] The Intelligence

Community also failed to predict the Tet Offensive in Vietnam until just hours before the attack. "The analysis failure occurred in where, when, and why."[16] Joseph Nye cites the "analytical disarray in 1978 that prevented the drafting of any estimate about the fall of the Shah, and the 1989 prediction that Saddam Hussein would not make trouble for the next three years."[17] Members of the Senate Select Committee on Intelligence recently voiced their concern about the Intelligence Community's inability to warn of the Indian nuclear tests, calling it the "greatest failure for more than a decade."[18] Others point out that by improving intelligence analysis the Intelligence Community can better support and protect U.S. embassies from terrorist threats.[19]

Some intelligence analysts believe that the ratio of intelligence successes to failures is actually quite good. Arthur S. Hulnick, a notable veteran in the intelligence profession, is one such believer. He stated in a conference paper delivered at the 1987 Annual Meeting of the American Political Science Association that

> the products of the [Intelligence Community] reflect continued growth in the expertise of the analysts, a broader and deeper range of subject materials, and an increasingly sophisticated data base from which to work. Coupled with advances in presentational methodologies, the intelligence product is more useful, timely and relevant than ever before.[20]

Despite his optimism for intelligence analysis, Hulnick agrees that the "analytic process itself is worthy of research."[21]

Because of the Intelligence Community's failures to foresee a number of strategically important foreign developments, intelligence consumers have tended to disregard any analysis of intelligence information. "Whether analysis is good or not, many policymakers will care less about it than they do about collection. They may even resent it, seeing it as naïve speculation by junior bureaucrats that wastes their time."[22] Roger Hilsman, former Assistant Secretary of State for Intelligence Research and Assistant Secretary of State for Far Eastern Affairs, argues that the benefits of funding a large team of field agents is not worth the cost or risk. Covert action tempts presidents into risking the hard work of analysts and diplomats on an "easy fix," damages America's reputation, and is antithetical to a democracy. He concludes that the Intelligence Community should

focus its efforts on improving its analytical support.[23] If the Intelligence Community is to overcome this credibility problem, it must improve its ability to produce accurate, timely, and useful intelligence.

Furthermore, the military's use of precision, information-intensive weapons creates pressure on the intelligence analyst to deliver useful intelligence at faster rates. In the era of modern warfare, fast and precise weapons demand fast and precise intelligence. The intelligence analyst who is unable to conduct analysis quickly can become an information-bottleneck in this environment. It may be arguable that the use of structured analytical techniques helps to speed up the analytical process. This assertion has not been tested, and is beyond the scope of the present research.

Terms of Reference

Quantitative intelligence analysis separates the relevant variables of a problem for credible numerical measurement. Qualitative intelligence analysis breaks down topics and ideas that are difficult to quantify into smaller components for better understanding.[24] Structured methodologies are various techniques used singly or in combination to separate and logically organize the constituent elements of a problem to enhance analysis and decisionmaking.[25] Some structured methodologies, such as organized brainstorming techniques, complement the analyst's intuition and facilitate creativity.

Non-structured methodology is intuitive. Intuition is a feeling or instinct that does not use demonstrative reasoning processes and cannot be adequately explained by the analyst with the available evidence. For the purposes of this study the term "improve," when referring to qualitative intelligence analysis, means to increase, either singularly or in any combination, without decreasing, either singularly or in any combination, the accuracy, specificity, or timeliness of the result.

This study assumes that exploiting structured methodologies for qualitative intelligence analysis does not invariably subordinate one's intuition, education, or experience. The analyst must still make a conscious choice as to whether he will accept a conclusion based on exploiting a structured method or reject it in favor of his intuitive judgment. Moreover, intuition plays an inescapable role in analysis. However, although intuition can usually be relied upon to provide effective solutions to simple problems, it cannot cope with the highly complex problems that routinely face intelligence analysts.

Many factors affect the quality of intelligence analysis. This study is limited to arguing how structured methodologies may influence the results of qualitative intelligence analysis. Due to time and cost considerations, it was necessary to restrict the scope of the

experiments to intelligence analysts at four of the nine Joint Intelligence Centers (JICs) of the Unified Commands. Specifically, experiments were conducted with intelligence analysts from the U.S. Special Operations Command (SOCOM), the U.S. Central Command (CENTCOM), the U.S. Southern Command (SOUTHCOM), and the U.S. Joint Forces Command (JFCOM), formerly Atlantic Command (ACOM). Because of these limitations, the evidence presented here should be considered only provisional, not conclusive.

THE ART OR SCIENCE DEBATE

A long-standing debate exists within the Intelligence Community about whether more should be invested in structured methodologies to improve qualitative intelligence analysis. At the heart of this controversy is the question of whether intelligence analysis should be accepted as an art (depending largely on subjective, intuitive judgment) or a science (depending largely on structured, systematic analytic methods). Resolving this question is necessary to provide direction and determine an efficient and effective approach to improve analysis. If qualitative intelligence analysis is an art, then efforts to improve it should focus on measuring the accuracy of one's intuition, selecting those analysts with the best track record, and educating them to become experts in a given field. If, on the other hand, qualitative intelligence analysis is a science, then analysts should be trained to select the appropriate method for a given problem from a variety of scientific methodologies and exploit it to guide them through the analytical process.

Qualitative Analysis as an Art

Proponents of this argument contend that qualitative intelligence analysis deals with an infinite number of variables that are impossible to operationalize because they cannot be adequately quantified or fully collected. A foreign nation that attempts to conceal or disguise information on many of the same variables that an analyst seeks will further complicate the analytical function. Because in many cases the variables are so complex, countless, and incomplete, attempting to analyze them using scientific methods is pseudo-science.[26] Therefore, any attempt to make predictions based on quantifying these variables is futile.[27]

Other arguments attack the rational-actor assumption made by most scientific approaches to qualitative intelligence analysis. "Science can be of little help when dealing with the often irrational and unpredictable human mind."[28] But these critics acknowledge that the traditional approach to qualitative analysis, being an art, is vulnerable to failure — "humans are still fallible in matters of analysis and response."[29]

[28] Finley, "Nobody Likes to be Surprised," 40.

Those who advocate that qualitative intelligence analysis is an art maintain that the most successful analysts take an inductive approach, "in which powers of pattern recognition are enhanced and intuition is elevated."[30] They insist that this approach will lead to more creative and original analysis. They argue that qualitative intelligence analysis is an art because it is an intuitive process based on instinct, education, and experience.[31] Gary Klein, a cognitive psychologist and pioneer in pattern recognition, makes some convincing arguments to support this claim. He challenges the practicality of using scientific methods for qualitative intelligence analysis outside the classroom.

"It is time to admit that the theories and ideals of decisionmaking we have held over the past 25 years are inadequate and misleading, having produced unused decision aids, ineffective decision training programs and inappropriate doctrine."[32] He continues:

> The culprit is an ideal of analytical decisionmaking which asserts that we must always generate options systematically, identify criteria for evaluating these options, assign weights to the evaluation criteria, rate each option on each criterion and tabulate the scores to find the best option.... The technical term is multiattribute utility analysis.[33]

He concludes that:

> [t]hese strategies sound good, but in practice they are often disappointing. They do not work under time pressure because they take too long. Even when there is enough time, they require much work and lack flexibility for handling rapidly changing field conditions.[34]

It is important to note that the majority of Klein's research has been conducted with leaders in the armed forces and emergency service providers such as firemen, but not specifically members of the Intelligence Community. There has always been a clash of cultures between operators (commanders and other decisionmakers whose focus is on accomplishing the mission at hand) and intelligence analysts. As intelligence analysts have attempted to bridge the gap between the two cultures, they have tended to adopt the same intuitive decisionmaking strategies commonly used by operators.[35]

[32] Czerwinski, 140.

[33] Czerwinski, 140.

[34] Czerwinski, 141.

[35] The relationship between operators and intelligence analysts has also been the subject of much controversy. For a good summary see Jack Davis' article "The Kent-Kendall Debate of 1949," *Studies in Intelligence* 35, no. 2 (Summer 1991): 37-49.

Science May Offer Only Minimal Analytic Improvements. One argument against the value of structured analysis is that intelligence failures may less accurately be attributed to problems with analysis than to "the decisionmakers who consume the products of intelligence services."[36] Given that intelligence consumers can and do perform their own analysis of intelligence information, they may care less about others' analysis than about collection issues, for example.[37] Nonetheless, if analysts were to make it possible for policymakers to focus "on the methodologies of competing intelligence producers, they would be more sensitive to the biases and leaps of faith in the analyses passed to them,"[38] even if the improvement in quality of analysis were minimal. Opponents of scientific methodologies further claim that, because qualitative intelligence analysis is largely an intuitive exercise, analysts should be encouraged to specialize and be educated into becoming experts in their field. These opponents question the validity of scientific methods and object to others who would use such methods to challenge their expert opinion. To improve analysis, they argue, the analyst must improve his intuitive ability by gaining "area knowledge" through frequent contact with the subject of his study. In the face of these challenges, however, and prior to further debating to what degree the quality of analysis may be improved by using structured methods, the basic research question remains unanswered: Will the use of structured methods improve qualitative intelligence analysis?

A Rebuttal. At first glance it seems that opponents of the scientific approach are criticizing the results of scientific methods. Yet they offer no empirical data to show which approach produces more accurate results, the scientific or the intuitive. The critics do denounce the amount of time it takes to scientifically analyze a problem. However, one should recognize that there are many scientific methodologies available to aid decisionmaking, and selecting and using one need only be as complicated and time-consuming as the analyst wishes.[39]

Unquestionably, the complexity of some scientific methodologies prevents them from being regularly exploited by most intelligence analysts. A graduate of the Joint Military Intelligence College (JMIC) made the following observation in his Masters thesis:

> A major issue common to all the methods is customer acceptance. Due to the highly mathematical nature of [Bayesian Decision Analysis], many users will feel uneasy trusting the resulting assessments. This will only be overcome through proper training of the analysts using [Bayesian Analysis] and repeated exposure to Bayes on the part of decisionmakers.[40]

Nevertheless, this lack of confidence should not be allowed to stand as a sweeping indictment of other, more simple and appropriate methodologies.

It is apparent that what these critics are saying is that no one in the heat of producing actionable intelligence uses the scientific approach, so why bother? This brings up two important questions:

(1) Which analysts, if any, are exploiting scientific methodologies when conducting qualitative intelligence analysis?

(2) Which approach (the intuitive or the scientific) produces the more accurate, timely, and useful result?

Other critics concede that utilizing scientific approaches to solve qualitative intelligence problems may improve the product of analysis, but they argue that the benefits are only minor. They insist that allocating resources to other areas such as reorganizing the intelligence bureaucracy, increasing manpower, and improving communication will better improve the intelligence product. One cannot deny that a host of factors affects the quality of intelligence analysis, but improvements to the process do not have to be pursued through a linear approach, nor should effort be wasted trying to determine which approach will yield the most significant improvement. If there is sufficient evidence that a reform promises improvement, it should be pursued.

Qualitative Intelligence Analysis as a Science

A few analysts see qualitative intelligence analysis as a science. Since 1973 the Central Intelligence Agency (CIA) has experimented with quantitative methods in an attempt to apply innovations in the behavioral sciences to political intelligence analysis.[41] At that time neither the Departments of State nor Defense had attempted to integrate quantitative methodologies into their political intelligence production.[42] Much of the effort to incorporate quantitative methodologies into the realm of qualitative intelligence analysis was rejected by analysts because the scientific methods were thought to be too narrowly focused and not relevant to the questions the intelligence analysts were addressing. Most analysts tended "to be skeptical of any form of simplification inherent in the application of probabilistic models."[43]

In spite of the skepticism, advocates of using a more scientific approach in qualitative intelligence analysis assert that science is a necessary tool to use when conducting qualitative analysis. They argue that, although it is impossible to consider every variable when conducting analysis, one can identify key variables and weigh their importance. And although much may be unknown, identifying what is known and analyzing it

[43] Heuer, 6.

scientifically is an effective approach. As one Intelligence Community advocate of a more scientific approach to intelligence analysis notes, the identification and use of big-picture, strategic insights can yield intelligence of more value than merely continuing to try to fathom, through the "art of intelligence," transient ideographic actors or their actions: "[Y]ou can disregard [military or political leaders'] madness and genius more readily than societal, economic, or political trends (which are scientifically identifiable) in analysis."[44]

Proponents of qualitative analysis as a science argue that scientific methods help analysts determine the relevancy of information and form conclusions, a process that analysts do not perform well on their own. Hall makes the point that:

> in the absence of concrete guidance or structure[,] analysts generally don't do well in forming conclusions and in discerning relevancy.... They sometimes have difficulty in figuring out relationships among seemingly unconnected pieces of information and in forming fragments of information into a coherent whole.[45]

If qualitative intelligence analysis is art, there is also a concern that the artist will fall in love with his art and be reluctant to change it even in the face of new evidence. The more scientific and objective approach encourages the analyst to be an honest broker and not an advocate.

Science in Other Types of Qualitative Analysis. Scientific methods have been used effectively to assist qualitative analysis in areas outside intelligence. An article in *The Economist* discusses the use of mathematical formulas to solve "normal" business problems that most managers argued could not be solved through quantitative approaches.[46] These managers argued that in their decisionmaking process they practice an intuitive art rather than a rational science. However, science and the use of quantitative methodologies in this case proved to be a more systematic and profitable approach than instinctive trial-and-error. Although many of the managers remained skeptical that such methods would continue to work, these methods do provide another approach to decisionmaking that should not be ruled out without evidence from comparative testing.

Although still not a standard practice in the private sector, some companies are increasingly exploiting quantitative methods and technology to help them make better decisions, increase profits, and compete in the information revolution.[47] If applying quantitative methodologies to qualitative analysis facilitates management of technological

information, it stands to reason that the Intelligence Community can selectively use this same approach to improve qualitative intelligence analysis.

Inside and Outside of the Classroom. Many proponents of exploiting scientific methodologies to aid intelligence analysis assume that these methods are regularly used in real-world analysis. Hulnick presents the typical view:

> Advances in analytic methodology seem to have grown remarkably in the past decade. While a discussion of explicit methods goes beyond the scope of this article — and the knowledge of the author — a wide variety of ways of attacking a problem exists. Managers of intelligence must assume that analysts try different techniques, sometimes by giving the problem to separate groups for analysis by different disciplines, sometimes by seeking an outside expert to provide competing analysis.[48]

The former chief of the Analytic Support Group in the CIA's Directorate of Intelligence agrees with Hulnick. "An analyst must have a repertoire of analytic techniques to apply in problem solving. There now exists a rich set of analytic techniques such as pattern analysis, trend prediction, literature assessment, and statistical analysis."[49] The president of Evidence-Based Research, Inc., also expressed the opinion that most intelligence analysts use some type of systematic approach when conducting qualitative intelligence analysis.[50]

This assumption that intelligence analysts use these various scientific approaches is based not on empirical evidence, but on the belief that experience alone does not make an expert, and that an expert must have a tool for structuring knowledge to efficiently solve a problem. Yet the numerous interviews conducted in support of this study, among intelligence analysts from all different agencies and backgrounds, positively invalidate this assumption. Of the 40 intelligence analysts interviewed in direct support of this study, only one maintained that he regularly used a structured methodology (link analysis) and could adequately explain the method and provide current examples of his work.[51] Although the other analysts who attempted to explain their analytical methodology described how they were tasked and how they collected information and prepared it for dissemination, they consistently and strikingly made no mention of analysis. The interviews serve only to confirm Klein's more detailed study: "After studying over 150 experienced decisionmakers and 450 decisions, we concluded that [the intuitive] approach to decisionmaking is typical."[52]

[51] Tim DiPace, U.S. Atlantic Command Anti-Terrorism/Force Protection Officer, interview by author, 19 March 1999.

[52] Czerwinski, 144.

> In further support of the author's findings, JMIC graduate Stewart Eales notes: Evaluating the analytical effort in the PURPLE SUNSET wargame is difficult because there was so little to measure. Despite assertions by some that 'the analyst is at the center of the intelligence process,' the... students virtually ignored analysis. ... As a result, there was little time or effort dedicated to thoughtful analysis and dissemination.[53]

This observation was confirmed during the interviews with the JIC analysts. A repeated complaint was the analyst's lack of time to devote to thoughtful intelligence analysis. In a separate interview at CIA, it was revealed that in spite of most intelligence analysts having a broad definition of what analysis involves, they spend little time or effort conducting analysis.[54]

As noted earlier, Betts asserts that many policymakers see little or no value in intelligence analysis because it is based on the views of less experienced personnel.[55] This may be the case because so many intelligence analysts are reluctant to exploit scientific methodologies, and most intelligence analysts are junior to the decisionmakers they support. Decisionmakers typically form conclusions based on intuition developed through years of experience. Therefore, the intelligence analyst who provides an assessment based on inexperience and his own (lesser developed) intuition should not expect to be taken seriously. To be credible the analyst must use objective scientific methodologies to support his conclusions.

While the research for this study sought to collect definitive evidence of frequent and widespread use of scientific methodologies within the Intelligence Community, only rare anecdotal information could be obtained showing that such methodologies are actually used by intelligence analysts in real-world situations, despite the ready availability of these methods. The National Warning Staff, for example, uses only one quantitative analytical methodology, a modified-Bayesian technique.[56]

A lack of expertise in exploiting scientific methodologies appears to be at the root of the Intelligence Community's failure to use them. One cannot expect intelligence analysts to exploit these methodologies unless they are trained how to select the appropriate analytical method and apply it to a real-world analytical problem. Analysts at the CIA have made use of computer programs, such as FACTIONS and Policon, based on a quantitative methodology, to assist in political analysis and warning. In one application, while both intuitive-based and scientific-based political intelligence forecasts were accurate about 90 percent of the time, intelligence analysts using Policon provided more specific and less ambiguous intelligence.[57] Although this example provides limited

documentation, it raises the question, why do not other members of the Intelligence Community share, compare, and exploit these methodologies?

Qualitative Intelligence Analysis as Both Art and Science

The fallacy in the art or science debate may be the "either/or" proposition. If qualitative intelligence analysis is not exclusively an art nor a science, then it may best be considered a combination of both intuitive and scientific methods:

> In our world is an infinite set of problems which have no logically consistent answer; there are some problems which any framework alone cannot solve. ... Yet strategists must not live by inspiration alone. Inspiration unsupported by rigorous analysis becomes adventurism [sic]. Thus intuitive gifts must be paired with an effective theoretical framework.[58]

Availability of Structured Methodologies

In order to expand the applicability of quantitative methodologies to qualitative problem solving, relatively uncomplicated methods have been developed to help intelligence analysts structure their analysis. These structured methods, which can be applied to a broad range of problems and do not focus exclusively on mathematical solutions, provide a scientific and demonstrable approach to analysis that can enhance the intelligence analyst's objectivity. Structured methodologies do not try to replace the subjective insight of the intelligence analyst. Instead the intent is to use a logical framework to illustrate and capitalize on intuition, experience, and subjective judgment.

Some publications do identify which methods are best suited to solve particular types of analytical problems,[59] but not all intelligence analysts receive training in these methodologies. Morgan Jones, a former analyst for the CIA, has recently added *The Thinker's Toolkit: 14 Powerful Techniques for Problem Solving.* This book presents 14 structured methods to aid analysis and decisionmaking. Although it is written for both business and personal use, the structured methods he discusses are among those taught to the fraction of Intelligence Community analysts who enroll at the Joint Military Intelligence College or other intelligence schools.

Numerous other books and software are dedicated to teaching an analyst how to apply one specific structured methodology. The Rand Corporation, for example, offers a book providing a specific methodology for predicting ethnic conflict. The authors propose a model divided into three stages meant to help an analyst identify the fundamental

potential for strife, the movement of possible strife into probable strife, and whether probable strife will turn into real conflict.[60] Many technology companies produce software to assist the user in problem solving by guiding him through a structured methodology and product demonstrations via the Internet.[61]

Exploitation of Structured Methodologies

A structured methodology provides a demonstrable means to reach a conclusion. Even if it can be proven that, in a given circumstance, both intuitive and scientific approaches provide the same degree of accuracy, structured methods have significant and unique value in that they can be easily taught to other analysts as a way to structure and balance their analysis. It is difficult, if not impossible, to teach an intelligence analyst how to conduct accurate intuitive analysis. Intuition comes with experience. What is clear is that, even though a mixture of science and intuition is probably needed to produce superior qualitative intelligence analysis, structured methodologies are severely neglected. Even in the rare cases where a specific methodology is regularly used, there is too much reliance on only one method and not a mix of various methods. No one method is appropriate to every problem. What is needed is a set of analytical tools that can be applied individually or in combination as appropriate.

Why Are Structured Methodologies Not Used?

Structured thinking is radically at variance with the way in which the human mind is in the habit of working.[62] Most people are used to solving problems intuitively by trial and error. Breaking this habit and establishing a new habit of thinking is an extremely difficult task and probably the primary reason why attempts to reform intelligence analysis have failed in the past, and why intelligence budgets for analytical methodology have remained extremely small when compared to other intelligence functions.[63]

Under the accelerating pressures of time, intelligence analysts feel that structured analytical approaches are too cumbersome.[64] They also sense that with the increased use of structured methods comes increased accountability. An excessively burdened intelligence analyst is less confident in his own ability and will not unnecessarily expose himself to criticism. Reliance on intuition and the resistance to incorporate scientific approaches complicate the task of getting analysts to exploit structured methodologies to assist qualitative intelligence analysis.

Intelligence analysts are also not exploiting structured methodologies when they conduct qualitative intelligence analysis because they are not convinced that this will improve their analysis. If empirical evidence shows that such an improvement will take place, then analysts may consider it worth the investment of time, effort, and risk required on their part to regularly exploit structured methodologies. However, if such empirical evidence shows that exploiting structured methodologies will not significantly improve qualitative intelligence analysis, then analysts can devote their time and effort to enhancing their intuitive skills.

The results from the series of experiments conducted for this study may provide some empirical data needed by intelligence analysts to make a decision on whether they should begin exploiting structured methodologies.

THE EXPERIMENT

The Control Group Versus the Experimental Group

Arguments both for and against the use of structured methodologies to improve qualitative intelligence analysis may have merit. Therefore, empirical evidence is needed to determine if exploiting structured methodologies will improve qualitative intelligence analysis. A direct comparison of analytical results derived from using a structured method with results derived solely from an intuitive approach is necessary for a relevant experiment. The author designed an experiment to make such a comparison.

The purpose of the experiment was to compare the analytical conclusions drawn by individual analysts in two different groups: a control group and an experimental group. Individual analysts in the control group would use the traditional intuitive approach to analyze two different qualitative intelligence problems. Analysts in the experimental group would exploit a specific structured methodology to aid them in their analysis of these same two problems. Analysts' answers would be scored as either correct or incorrect and compared statistically to determine whether the experimental group did significantly better than the control group.

Competing Hypotheses and Level of Significance

The experiment would test the truth of both the null hypothesis (H_0) and the alternative, or research, hypothesis (H_1). The level of significance was set at .05 before the experiment was conducted.[65]

---

[65] A one-tailed test of statistical significance is appropriate to determine whether to reject the null and research hypotheses, given their directional nature. Two-tailed tests are appropriate to determine if factors such as rank, experience, education or branch of service may have affected the results of the experiment, as no assumption was made as to how these factors may influence qualitative intelligence analysis. The author is grateful to Francis J. Hughes, JMIC Faculty, for invaluable assistance in identifying statistical methods appropriate to this study.

H_0: Exploiting structured methodologies *will not* improve qualitative intelligence analysis.
H_1: Exploiting structured methodologies *will* improve qualitative intelligence analysis.

Determining Sample Size and Choosing a Statistical Test

Due to the real-world commitments of the intelligence analysts at each JIC, it was impossible to predetermine how many analysts would be sampled during the experiment. Not knowing the sample size or expected frequencies of each cell beforehand made it impossible to select an appropriate statistical test to analyze the information until all of it was collected. On the day of the experiment each JIC Commander decided which intelligence analysts would be available to participate. The decision of who would participate was made based upon that day's schedule as driven by operational requirements. The decision was not made based upon an attempt to alter the results of the experiment.

The available analysts from each JIC were randomly assigned to either the control or experimental group. Both the control group and the experimental group had 13 analysts each. The total number of analysts sampled (N) during the experiment was 26. Due to the small sample size and associated low cell frequencies, Fisher's Exact Probability Test was used to determine statistical significance for the hypotheses and for the influence of the controlled factors (rank, experience, education and branch of service).[66]

Collection Procedures

Analysts in both control and experimental groups completed a one-page questionnaire to provide the demographic information needed to crosscheck the validity of the results gathered from the experiment. Each analyst was asked to identify any training or familiarity they had with using various structured analytical methodologies and how frequently, if ever, they used structured methodologies during real-world analysis. Then the analysts in the control group were dismissed and asked to return at a later time. The analysts in the experimental group were given an hour of training on a specific structured methodology—hypothesis testing. The training was standardized at each JIC and taught from the same lesson plan and workbook.[67] The analysts in the experimental group were asked not to discuss their training with the analysts in the control group until after the experiment.

When the analysts assigned to the control group returned, the two groups were segregated. Each analyst in each group was then given a map, both intelligence scenarios,

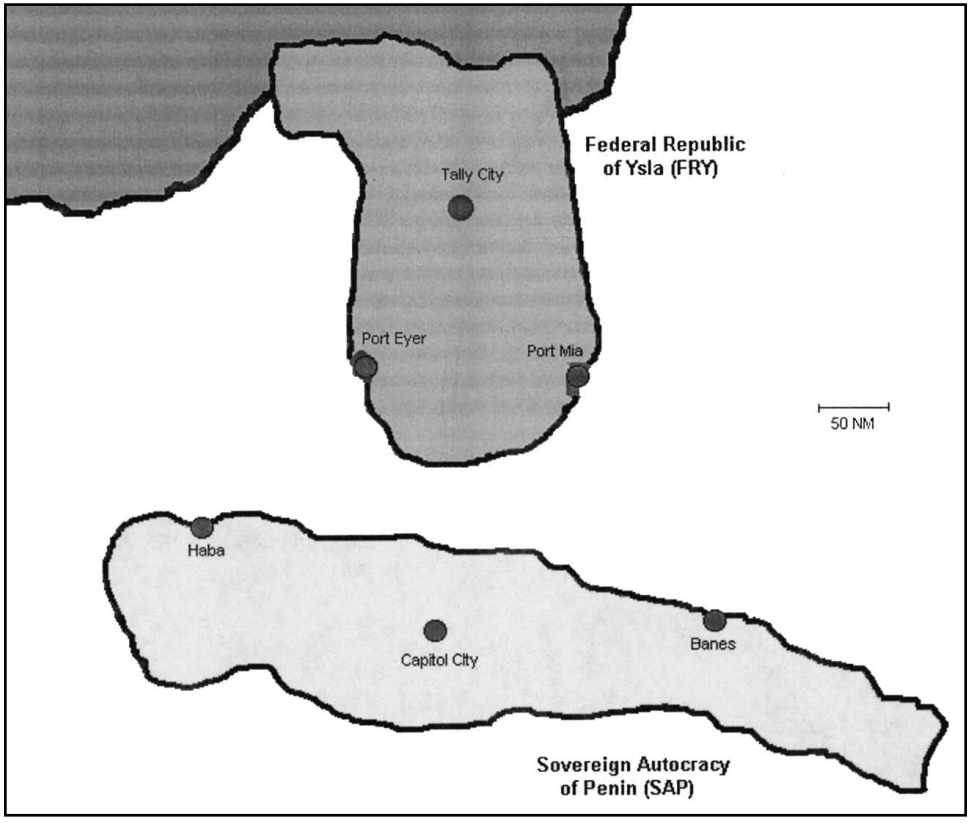
---

[66] Marija J. Norusis, *SPSS 8.0 Guide to Data Analysis* (Upper Saddle River, NJ: Prentice-Hall, 1998), 315. Fisher's Test produces a probability for a one-tailed test. Several theories address how one can use Fisher's Test to produce a probability for a two-tailed test. The most common method is to simply double the one-tailed test result, and not to exceed a probability of 1. Doubling the probability for one-tailed results is the method the author used. Other methods use more complicated mathematical formulas, but yield similar probabilities.

[67] Morgan D. Jones authored the Hypothesis Testing Lesson Plan and workbook, which were used by permission. For further information on his hypothesis testing methods, see Chapter 11 of Jones' *The Thinker's Toolkit.*

and an answer sheet for each scenario. (See information on following pages). Each person was asked to analyze the first scenario, then to complete the answer sheet as individuals within one hour. Once this task was completed, they were asked to analyze the second scenario and complete its answer sheet as individuals within 30 minutes. At the end of the allotted time they were asked to turn in their completed answer sheets and any other notes they had made. Both groups were given the same amount of time to analyze the scenarios and to complete the answer sheets, so neither group had an advantage of time over the other. All notes made by the analysts were collected to determine what approach analysts in the control group used and to ensure that analysts in the experimental group properly applied the hypothesis testing method. All analysts were interviewed after completing the experiment to gain further insights into how they approached analyzing intelligence problems presented both in the experiment and in their official duties.

Only the first question on the answer sheet for each intelligence problem was scored. It was scored as either correct or incorrect. For the first intelligence scenario the correct answer was to expect an attack at Port Mia. For the second scenario the correct answer was that the intentions of the adversary government were peaceful.



Map for Intelligence Scenarios 1 and 2.

INTELLIGENCE SCENARIO 1

You provide strategic intelligence to the military and political leaders of your country, the Federal Republic of Ysla (FRY). The Sovereign Autocracy of Penin (SAP) and FRY are at war. SAP is conducting air reconnaissance, special operations, and air bombing attacks against FRY to prepare the way for a military attack. You have determined that due to the unique geography of your country and the limited amphibious capabilities of the SAP military, only two places in FRY are vulnerable to an amphibious attack by the SAP military. SAP naval forces can conduct operations out to 250 nautical miles. To best defend FRY you need to determine how and where the SAP military invasion will occur. Using the above assumptions and the scenario map, conduct an analysis of the following intelligence information (it is listed chronologically). Keep in mind that the FRY National Leadership is concerned the SAP military will launch a diversionary attack against Port Mia while the main attack is against Port Eyer. They want your analysis to include information on whether the SAP military is planning to use deception, diversion, or neither in conjunction with their attack.

Based on order of battle from multiple sources you know the majority of SAP naval/ amphibious forces are docked in port at Banes. Multiple sources indicate that SAP has relocated most of its ground forces to Haba and reassigned them to the recently modernized Third SAP Corps. COMINT reporting indicates that a new SAP Marine General was assigned as Commander of the Third SAP Corps. On January 28th open sources report that General Sage, the SAP Supreme Military Commander, left SAP to encourage the nearby countries to remain neutral during the conflict; his travel schedule and return date are unknown. The SAP Government publicly announced a ban on all visits to the SAP coast. 007, one of FRY's top HUMINT agents working in Capitol City, reported the SAP main attack will occur near Port Eyer and may be preceded by diversionary attacks elsewhere in FRY. 086, another FRY spy, working near Banes reported that SAP would land a small force at Port Mia before the main attack at Port Eyer. Multiple sources indicate the SAP military has conducted amphibious exercises with submerged obstacles. COMINT reporting indicated major moves of SAP marine military forces to the northwest part of SAP. COMINT reports also indicated a major movement of forces from Capitol City to the northeast. SAP bombing raids against Port Eyer number twice that against Port Mia. The SAP bombing of Ports Eyer and Mia has restricted the flow of traffic in and out of both areas. The majority of SAP air reconnaissance and special operations have been against Port Eyer. On February 19th, FRY air reconnaissance showed no changes in ships at Haba. On February 25th, FRY air reconnaissance showed no change in shipping traffic in Banes. On March 8th, FRY air reconnaissance of both Haba and Banes showed increased shipping around Banes only. On March 30th, FRY air reconnaissance showed 20 new landing craft docked at Haba; air reconnaissance at Banes on the same day was inconclusive due to weather.

QUESTIONS FOR INTELLIGENCE SCENARIO 1

1. Where and how will the SAP's military attack FRY?

2. Support your conclusion. (Please attach any other notes you made.)

3. What other possible courses of action did you consider?

4. What analytical method did you use? How did you analyze this scenario?

5. Was this scenario similar to another current or historical event?

6. What is your assessment of the validity of this experiment?

7. Please provide your name and rank. Your answers and identity will be kept anonymous!

INTELLIGENCE SCENARIO 2

Due in part to your exceptional analysis, the Federal Republic of Ysla (FRY) successfully defended itself from a major invasion by the Sovereign Autocracy of Penin (SAP). On May 8th of last year, the war ended in a stalemate after the U.S. intervened, and both FRY and SAP governments signed an armistice. U.S. troops established a presence in FRY to deter SAP from attacking again. The SAP Government is concerned that the FRY military may launch an attack on SAP. The SAP Government wants the U.S. to withdraw its forces from FRY before SAP signs any peace treaty. Tensions between the FRY and SAP remained high throughout the year. However, at the beginning of the New Year, the leader of SAP, President Castrol, appeared to be making peaceful overtures to the FRY Government. Your superiors have asked you to analyze the evidence below and determine whether the SAP Government has new and peaceful intentions.

On January 15th, the SAP News Agency, the official news agency of the SAP Government, described an interview that President Castrol had with the editorial committee of a Caribbean newspaper, *The Island Times* on January 10th. President Castrol proposed: "a peace agreement...may be concluded between SAP and FRY and the military forces of both countries may be cut drastically under the condition where the U.S. imperialist troops are withdrawn from FRY."

In a subsequent meeting with U.S. Senator Harley (Democrat) in mid-January, President Castrol made it clear that a peace agreement between SAP and FRY could be concluded before U.S. forces were withdrawn.

U.S. intercepts since mid-February of secure, high-level, SAP military command communications have revealed no indications of unusual military activities or preparations for hostilities.

Over the next seven months the SAP News Agency was consistent in reporting the new peace proposals, only occasionally reverting to a "hard line" stance and then attributing this stance to unnamed spokesmen.

Last year, shortly after the armistice was signed, Red Cross delegates from both FRY and SAP began meeting on a regular basis to share information to help locate and identify soldiers from both sides who were missing in action during the war. Initially, the SAP News Agency coverage of the Red Cross meetings was very negative. After January of this year, however, the tone of the coverage changed. The reporting became essentially factual and objective.

In February of this year, the SAP Government began a national blood donation campaign claiming shortages, although the reason for shortages was not disclosed nor had there been any major disaster causing shortages to occur. Later the same month, President Castrol gave another "unofficial" interview to a journalist from the *Washington Times.* In the interview President Castrol again iterated that a peace treaty could be signed between SAP and FRY before U.S. troops withdraw from FRY.

INTELLIGENCE SCENARIO 2

On March 15th, SAP announced the execution of five SAP nationals who were members of a FRY spy ring during the war.

The commander-in-chief of SAP armed forces retired on March 29th and was replaced by the deputy commander-in-chief.

The number and tone of SAP propaganda broadcasts changed noticeably in the spring. The number of anti-FRY radio broadcasts declined from about 25 per day to about 16 broadcasts per day. Also, the usual abusive and slanderous words used in the broadcasts were toned down considerably.

In April, the two governments signed an agreement allowing each other's military attaches unrestricted movement without pre-travel approval.

Monitoring of SAP News Agency wire service releases containing anti-FRY statements declined from a high of 27 percent in January to 10 percent in April.

Over the past six months SAP military training has maintained its normal cycle.

Training flights of SAP fighter aircraft and bombers have been significantly curtailed over the past four months. In that same period the FRY Government has not detected any attempt by the SAP Government to infiltrate agents or armed guerrillas

The unusually large number of SAP reservists called to active duty during the war will be discharged this month.

SAP ground-force medical units conducted a large-scale, out-of-training-cycle exercise yesterday.

U.S. photoreconnaissance reveals that dozens of landing craft used in the SAP military operations against FRY during the war have not been repaired.

QUESTIONS FOR INTELLIGENCE SCENARIO 2

1. What are the intentions of the SAP Government?

2. Support your conclusion. (Please attach any other notes you made.)

3. List all the possibilities you considered.

4. What analytical method did you use? How did you analyze this scenario?

5. Was this scenario similar to another current/historical event?

6. What is your assessment of the validity of this experiment?

7. Please provide your name and rank. Your answers and identity will be kept anonymous!

HYPOTHESIS TESTING ILLUSTRATION: INTELLIGENCE SCENARIO 1

Possible Hypotheses are:

H1: Main attack at Port Eyer, no major deception or diversion.

H2: Main attack at Port Eyer, with deception pointing to Port Mia.

H3: Main attack at Port Eyer, with diversionary attack at Port Mia.

H4: Main attack at Port Mia, no major deception or diversion.

H5: Main attack at Port Mia, with deception pointing to Port Eyer.

H6: Main attack at Port Mia, with diversionary attack at Port Eyer.

Hypothesis Testing Matrix Example for Intelligence Scenario 2[68]

[68] Although assigning a C, I, or ? to an individual line of evidence is a subjective judgment, by visually displaying the evidence and hypotheses in a matrix the analyst can better judge each piece of evidence then aggregate all the evidence to determine which hypothesis is most likely true. Subjective judgments and intuition still play an inescapable role in analysis. Individual analysts will seldom assign C, I, or ? in the same way, but by visually displaying it, other analysts can question their logic, readily identify which pieces of evidence they disagree on, and more quickly form a consensus.

Experimental Results Arrayed in Contingency Tables

Tables 1 and 2 summarize the responses given by analysts in the control and the experimental groups to each intelligence scenario. Tables 3-10 show how the analysts answered each intelligence scenario based on rank, years of experience, level of education, and branch of service.

Analytical Strategy

Fisher's Exact Probability Test was used to statistically analyze the data and determine whether the null hypothesis could be rejected. This formula was also used in a two-tailed test to measure any variances in responses based on the different demographic groups. In these cases Fisher's Test would measure the probability that the differences in the answers were caused by some other factor than the use of a structured methodology to assist in qualitative intelligence analysis. The original tables displaying demographic data for the control and experimental groups contained several columns, not just two. However, Fisher's Test can be used to measure data only in a two-by-two matrix, so it was necessary to modify the original tables by combining some columns to arrange the data in an appropriate two-by-two matrix.

CONSIDERATIONS AND LIMITATIONS

Although this experiment did collect and analyze data on several different factors that might affect the answers an analyst would provide, it could not identify and analyze all factors. To encourage individual participation an agreement was made that the results of individual analysts would not be released. To encourage the JICs to provide as many analysts as possible it was agreed that the specific results of each JIC would be made available only to that particular JIC. This experiment was designed to compare the answers given by the control and experimental groups; it would not compare JIC against JIC. Therefore, the way in which analysts were made available, driven as it was by real-world events, did not alter the validity of the experiment.

Designing the Experiment

Certainly, one can find some fault in both intelligence scenarios used during the experiment. Nevertheless, both scenarios were submitted to a rigorous pre-testing and revision process to ensure both scenarios were valid and reliable measures of an intelligence analyst's qualitative analytical capability during the time allotted for the experiment and appropriate for the structured methodology taught to the experimental group.

Several obstacles hinder the design of an intelligence scenario to measure the accuracy of an analyst's conclusions. A hypothetical scenario begs the question of whether one can authoritatively claim that a correct answer exists. Since the event never occurred, the burden is on the creator of the scenario to ensure only one conclusion can be drawn. In contrast, using an actual historical event as the basis for an intelligence scenario runs the risk that the analyst will recognize the scenario for what it is and base his conclusions on the known outcome rather than on the evidence presented. The intelligence scenarios used in the experiment were based on actual historical events.

The first scenario was developed in coordination with Tom Murray, former CIA analyst and trainer and currently Senior Vice President of Sequoia Associates, Incorporated. The scenario was based on known strategic intelligence possessed by

German intelligence prior to the invasion of Normandy during World War II. It was necessary to alter some of the evidence such as the names of individuals, units, and geographic locations in the scenario to disguise the fact that this scenario was based on the invasion at Normandy, but the basic evidence remained unchanged. In this scenario the analysts were asked to determine where the actual invasion would occur.

The second intelligence scenario was based upon a case study presented in *Intelligence Research and Methodology*, by Jerome Clauser and Sandra Weir. The case study examined a series of incidents in which it appeared the North Korean Government was making a sincere effort to improve peace on the peninsula in the 1970's.[69] This scenario was modified with the assistance of Morgan D. Jones. The subjects were asked to determine whether the adversary in the scenario was sincerely pursuing peace, using peace as a deception, or conducting business as usual.

Various students at the JMIC tested both intelligence scenarios before they were used in the experiment at the JICs. The students were asked to analyze both scenarios and complete an answer sheet. The answer sheet asked them to draw some conclusions and also asked whether they recognized the scenarios as any actual historical event. The scenarios were then modified and given to another group of students to test. In the final round of testing only three out of 20 students recognized that the first scenario was related to the Normandy invasion; however, only one of the three who recognized the historical link provided the correct answer. None of the students could identify the actual event used as a basis for the second scenario. During the actual experiment at the JICs, five of the 26 subjects identified the Normandy invasion as the basis for the first intelligence scenario. Four of these five were in the control group and the other was in the experimental group. Of the five only one in the experimental group and another in the control group provided the correct answer to the first scenario. No one at the JICs identified the actual historical event used as a basis for the second scenario. These checks on the historical identifiability of the scenarios address the potential concern of "analysis as art" proponents that deep familiarity with a particular region or problem would affect the outcome of this or a similar experiment. It would appear that this concern, though well-founded, can be overcome by careful selection of scenarios. Scenario construction or borrowing is not a simple matter, as a real-world "outcome" must be captured to ensure a "correct" answer is known.

The questions on the answer sheets were open-ended rather than multiple choice. Although using a multiple choice test simplifies the scoring process, it does not accurately portray how analysts provide answers outside the classroom. A multiple choice test defines the range of options available; in qualitative intelligence analysis, defining and narrowing the range of options is a part of the answer in itself. Asking open-ended questions provided insights into how many possible hypotheses each analyst considered and how specific a response each analyst felt confident in providing.

---

[69] Clauser and Weir, 358-369.

Time Spent Analyzing the Scenarios

Rather than allow the analysts to work at their own pace, a specific period of time was allotted to work each problem; however, the analysts were allowed to turn in their answer sheets anytime before the allotted time expired. Although it would be interesting to compare the number of correct answers with the amount of time spent on the problem, it would be of little help in determining whether exploiting structured methodologies will improve qualitative intelligence analysis. Based on observations made during the experiment, it seems that the amount of time spent on analyzing a problem had little to do with the analyst correctly answering a problem or using a structured method. Both control and experimental groups had analysts who completed both problems quickly and had analysts who used the entire amount of time allotted.

Most analysts work under a deadline. Allotting a fixed amount of time to solve each problem put pressure on the analyst (simulating real-world constraints) and ensured the answer sheets were returned in time to be included in this study. It also held the variable of time constant so the results of the experiment were less likely to be tainted by the time factor. Many of the analysts remarked that they enjoyed the opportunity to concentrate on a specific problem without being interrupted.

THE FINDINGS

This exploratory research provides empirical evidence suggesting that exploitation of a structured methodology (hypothesis testing in this example) will improve qualitative intelligence analysis. Even though this evidence is for a narrowly defined instance (the second intelligence scenario) and not conclusive, such evidence did not exist before this experiment was conducted. Factors such as rank, experience, education, and branch of service did not appear to affect the results.

Description of the Findings

As Tables 1 and 2 show, the overall qualitative intelligence analysis of those in the experimental group was better than that of those in the control group for both scenarios. Despite this, the improvement measured in the first scenario did not meet the threshold of statistical significance (see results for Table 1 in Table 11). Nor did the probabilities computed for Tables 3-10 meet the established threshold of statistical significance (see results for Tables 3-10 in Table 11), confirming that the differences in responses are probably not due to these factors. However, the improved qualitative analysis of the experimental group over that of the control group in the second scenario was statistically significant (see results for Table 2 in Table 11).

Table No.	Description	Scenario No.	Fisher's Probability
1	Control and Experiment	1	.5
2	Control and Experiment	2	.048
3	Rank	1	.844
4	Rank	2	.718
5	Experience	1	.844
6	Experience	2	1.0
7	Education	1	.844
8	Education	2	1.0
9	Branch of Service	1	.686
10	Branch of Service	2	.244

Table 11. Probabilities that Results are Due to Chance

Expectations

The results were surprising. The author expected a significant improvement in qualitative intelligence analysis in the first scenario, whose inherent complexity, it seemed, would give the analysts who used the hypothesis testing method an advantage over those who did not employ a structured method. But this advantage did not materialize. Most of the analysts using hypothesis testing seemed to have had difficulty identifying all of the possible hypotheses and determining the consistency of each piece of evidence with each hypothesis.

Because the second scenario was simple and straightforward, the author thought that there would be little or no advantage to be gained by structuring the problem and sorting the evidence. In the event, however, the structured approach proved more effective.

In hindsight it was asking too much to expect the analysts to proficiently apply the hypothesis testing method to complex problems like the first intelligence scenario after just one hour of training. This may explain, in part, why the experimental group did not perform significantly better than the control group on the first scenario. Because the first scenario, with six hypotheses to consider, is more complicated than the second scenario, with only three hypotheses, one may be tempted to conclude that the hypothesis testing method is useful for structuring only simple problems. Nevertheless, based on the information gathered during this experiment, the author would guess that the hypothesis testing method can be useful in structuring more intricate problems, provided that the analyst has been adequately trained to proficiently apply the method.

What Does All This Mean?

Quite simply, the experimental group performed significantly better on the second intelligence scenario than did the control group. The improvement appears to be due to members of the experimental group using a particular structured methodology while the members of the control group did not use any structured methodology to aid their analysis. The improvement does not appear to be a consequence of rank, experience, education, or branch of service. The improvement measured in qualitative intelligence analysis during the first intelligence scenario is not significant.

Why Improvement in the Second Scenario But Not the First?

The first scenario may have affected the control group's analysis of the second scenario. In the first scenario it was obvious that some form of deception was being used; the problem was determining which attack was real and which was the deception. The second scenario was more clear and direct; however, some analysts may have been biased and assumed deception was being used in the second scenario because of their recent exposure to the use of deception in the first scenario. It appears that those analysts who used the hypothesis testing method were better able to remain objective and analyze the evidence in the second scenario without being influenced by the first scenario. It seems the analysts who based their analysis solely on their intuition were less objective in their analysis.

Another Approach to Analyzing the Data

During the experiment each analyst was asked one question from both intelligence scenarios. Their answers were marked as either correct or incorrect. Thus, an analyst who answered both questions correctly scored 100 percent. If an analyst answered one question correctly and the other incorrectly, he scored 50 percent. If he answered both questions incorrectly, he scored 0 percent. The scores from analysts who used a structured methodology ranged from 50-100 percent. The analysts who did not use a structured methodology ranged in scores from 0-50 percent. While three analysts in the experimental group answered both questions correctly, no one in the control group answered both questions correctly. By this measure, exploiting a structured methodology improved qualitative intelligence analysis.

To Reject H_0 or Not?

Considering all the arguments, the information collected, and the analysis and interpretation of that information, the null hypothesis—that exploiting structured methodologies *will not* improve qualitative intelligence analysis—can be rejected. Of course there are several qualifiers that affect the veracity of the alternate hypothesis— that exploiting structured methodologies *will* improve qualitative intelligence analysis. The single most critical qualifier is that analysts must be adequately trained to ensure they are able to proficiently apply the appropriate structured methodology.

Unquestionably one can create a problem where the answer is so obvious that a structured methodology will be of no benefit. Likewise, one can design a scenario so complicated and ambiguous that the correct answer will never be revealed. Nevertheless, as this experiment demonstrated, there are instances where qualitative intelligence analysis can be improved by exploiting structured methodologies. Only by applying different structured methodologies to different types of intelligence problems will one find out where and when structured methods are most effective.

This experiment examined only one structured methodology—hypothesis testing. Other experiments that examine different methods, different problems, and utilize different analysts from different agencies could be pursued by other investigators. In the meantime, analysts within the Intelligence Community should be encouraged to exploit various structured methodologies.

IMPLICATIONS AND RECOMMENDATIONS

A Conclusion

This study has produced an answer to the question: "Will exploiting structured methodologies improve qualitative intelligence analysis?" The approach taken to answer the question was straightforward. Competing hypotheses were developed based on the research question, arguments supporting both hypotheses were explored, an impartial experiment was designed to provide empirical evidence, and a statistical test was used to determine the significance of the evidence produced. For both scenarios the analysts who used structured methods outperformed the analysts who did not. The improvement measured in the second intelligence scenario was statistically significant; therefore, the null hypothesis—that exploiting structured methodologies *will not* improve qualitative intelligence analysis—was rejected.

The author has determined that exploiting structured methodologies will improve qualitative intelligence analysis. There are, however, several qualifiers. The improvement is not necessarily automatic or significant for every case. Intelligence analysts must be adequately trained to select an appropriate structured methodology or combination of methodologies germane to the problem and apply the method(s) proficiently. A more precise conclusion drawn from the experiment as presented in this study is: "Exploiting structured methodologies *can* improve qualitative intelligence analysis." Further research is needed to definitively answer the original research question.

Other Insights

Based on the numerous interviews the author conducted with intelligence analysts from many different intelligence units and agencies, it is apparent that more basic research is needed in this area of intelligence analysis. Nearly every analyst had a different definition of intelligence analysis. Most analysts believe that analysis occurs automatically as they gather information and prepare that information for dissemination. It is not a function for which they specifically allocate time.

Analysis involves critical thinking. Structured methodologies do not perform the analysis for the analyst; the analyst still must do his own thinking. But by structuring a problem the analyst is better able to identify relevant factors and assumptions, formulate and consider different outcomes, weigh different pieces of evidence, and make decisions based on the available information. While exploiting a structured methodology cannot guarantee a correct answer, using a structured methodology ensures that analysis is performed and not overlooked.

From the discussions with the test subjects after the experiment it became obvious to the author that analysts in the control group were not as clear in their thinking as the analysts in the experimental group. After reading the scenarios members of the control group formed a conclusion, then went back to the scenario to find evidence that supported their conclusion and ignored contradictory evidence. When asked to justify their answers, analysts in the control group often cited some "key" information that gave them a flash of insight. Members of the control group seemed to be looking for the one piece of information—the "Holy Grail"— that would make sense of everything else. This approach flies in the face of the fact that, more often than not, qualitative intelligence analysis must be accomplished with incomplete information.

Members of the experimental group examined all evidence provided in the scenario prior to making their decision. They felt confident that they were making the best decision they could with the amount of information available. They acknowledged that their decision may not be the right one and added that if more evidence became available they would reevaluate their conclusion taking into account this new information.

Even though most analysts had not received training in or used structured methods previously, analysts who received training in hypothesis testing expressed the opinion that exploiting such a method would aid and improve their analysis.

Recommendations

The author recommends that various structured methodologies be taught to all intelligence analysts of every service and agency during both initial and subsequent training. Intelligence analysts should be encouraged to use structured methodologies when drafting analytical narratives. Analysts should be expected to utilize structured methodologies to visually present their analysis during intelligence briefings. Also, intelligence units conducting real-world qualitative intelligence analysis should be encouraged to experiment with different structured methodologies and compete with other similar units in regular analytical exercises. The results from exploiting various structured methodologies from both real-world situations and during exercises should be published and shared with other intelligence units, services, and agencies.

Further Research

The results of this experiment need to be confirmed. The author recommends that a series of similar experiments be conducted, either separately or in any combination, to test other factors that may affect the outcome of qualitative intelligence analysis.

Reverse Order of Scenarios. Future researchers may wish to conduct the same experiment as the original except reverse the order in which the intelligence scenarios are given to the analysts. Alternatively the researcher may develop his own scenarios but present them to different test subjects in a different order and track the results to see if the order in which the scenarios were presented affected the results of their analysis.

Intensive Training. Expand the amount of time spent training the experimental group from one hour to three or more hours and include more complex problems. Use the same scenarios as in the original experiment to test this author's theory that more training would have allowed the analysts to proficiently apply the hypothesis testing method to more complicated problems such as the first intelligence scenario.

Sophisticated Scenario. Future researchers may wish to conduct a similar experiment using a more sophisticated scenario to determine whether design flaws in the original scenarios affected the results of the original experiment.

Before and After. Instead of dividing analysts into control and experimental groups, have them analyze a scenario intuitively then train the same analysts in an appropriate structured methodology and have them analyze the same problem using the structured technique. Compare their first response with their second response and measure the improvement. A researcher utilizing this approach must develop a test to measure if the improvement arises from analysts' exploiting a structured method or simply from seeing the same or similar problem again.

Different Method. Conduct an experiment using a structured methodology other than hypothesis testing. The researcher must develop a new intelligence scenario appropriate to the structured methodology being tested.

Team Approach. Instead of measuring the responses of individuals, divide the analysts into teams and ask them to develop a consensus and answer the questions as a team. Have some teams use a structured methodology and have other teams use the traditional intuitive approach.

Measure Time. Instead of holding time as a constant, ask the analysts to solve the problems as quickly as possible and record how long it takes each analyst to solve the problem. Consider both accuracy and timeliness when measuring improvement in qualitative intelligence analysis.

Multiple Choice. Instead of asking open-ended questions, provide the analysts with a multiple choice answer sheet. This will simplify the scoring process and measure improvement while ensuring that every analyst considers the same possible outcomes.

Two-Tailed Test. Develop a hypothesis and design an experiment to measure if exploiting structured methodologies will cause a change in qualitative intelligence analysis in either direction. Also, other demographic information (such as gender, age, and personality type) should be collected and analyzed to see if these factors affect the results.

FINAL IMPRESSION

The author's motivation to conduct research into qualitative intelligence analysis comes from his own experience with the difficulties common to conducting and training others in analysis. Somewhat surprisingly, the present research has revealed how remarkably little analysts within the Intelligence Community appear to know about analytic methods, and less surprisingly, how great is the gap between their current and future analytic potential. It is clear to this researcher that a moderate investment in analytic training would substantially improve intelligence analysis.

The Joint Military Intelligence College supports and encourages research on intelligence issues that distills lessons and improves support to policy-level and operational consumers.

This series of Occasional Papers presents the work of faculty, students and others whose research on intelligence issues is supported or otherwise encouraged by the Joint Military Intelligence College through its Office of Applied Research. Occasional Papers are distributed to Department of Defense schools and to the Intelligence Community, and unclassified papers are available to the public through the National Technical Information Service (www.ntis.gov).

Proposed manuscripts for these papers are submitted for consideration to the Applied Research Editorial Board. Papers undergo review by senior officials in Defense, Intelligence, and occasionally civilian academic or business communities. Manuscripts or requests for additional copies of Occasional Papers should be addressed to Defense Intelligence Agency, Joint Military Intelligence College, Office of Applied Research, MCE, Bolling AFB, Washington, DC 20340-5100.

About the Author 81

INTELLIGENCE ESSENTIALS FOR EVERYONE

Preface

The "importance of understanding" has become almost an obsession with significant portions of American business. There remain, however, many companies that attempt to operate as they traditionally have in the past — placing great faith in the owner's or manager's judgment as to what is required to remain competitive.

In this paper, the author has articulated clearly the fundamentals of sound intelligence practice and has identified some guidelines that can lead toward creation of a solid intelligence infrastructure. These signposts apply both to government intelligence and to business. Good intelligence should always be based on validated requirements, but it may be derived from a wide variety of sources, not all of which are reliable.

Understanding the needs of the consumer and the sources available enable an analyst to choose the correct methodology to arrive at useful answers. The author has laid out in clear, concise language a logical approach to creating an infrastructure for government and business. Every system will have flaws but this discussion should help the reader minimize those weaknesses. It is an important contribution to the education of government and business intelligence professionals.

James A. Williams, LTG, U.S. Army (Ret.)
Former Director, Defense Intelligence Agency

INTELLIGENCE ESSENTIALS FOR EVERYONE

Foreword

Decades of government intelligence experience and reflection on that experience are captured in this primer. Ms. Krizan combines her own findings on best practices in the intelligence profession with the discoveries and ruminations of other practitioners, including several Joint Military Intelligence College instructors and students who preceded her. Many of the selections she refers to are from documents that are out of print or have wrongly been assigned to a dustbin.

This primer reviews and reassesses Intelligence Community best practices with special emphasis on how they may be adopted by the private sector. The government convention of referring to intelligence users as "customers" suggests by itself the demonstrable similarities between government intelligence and business information support functions.

The genesis for this study was the author's discovery of a need to codify for the Intelligence Community certain basic principles missing from the formal training of intelligence analysts. At the same time, she learned of requests from the private sector for the same type of codified, government best practices for adaptation to the business world. As no formal mechanism existed for an exchange of these insights between the public and private sectors, Ms. Krizan developed this paper as an adjunct to her Master's thesis, *Benchmarking the Intelligence Process for the Private Sector.* Her thesis explores the rationale and mechanisms for benchmarking the intelligence process in government, and for sharing the resultant findings with the private sector.

The author and editor wish to acknowledge the constructive comments of two reviewers from the business community, representing the Amoco Corporation and DeGenaro and Associates, Inc. of Sarasota, Florida.

Comments on this paper are welcome, and should be directed to the Office of Applied Research, MCE-2, Joint Military Intelligence College, DIAC, Bolling AFB, Washington, DC 20340-5100. Telephone (202) 231-4193; DSN 428-4193; e-mail *AFswerg@dia.osis.gov.*

Dr. Russell G. Swenson, Editor and Director, Office of Applied Research

PROLOGUE: INTELLIGENCE SHARING IN A NEW LIGHT

Education is the cheapest defense of a nation.
— Edmund Burke, 18th-century British philosopher

National Intelligence Meets Business Intelligence

This intelligence primer reflects the author's examination of dozens of unclassified government documents on the practice of intelligence over a period of nearly seven years. For the national security Intelligence Community (IC), it represents a concise distillation and clarification of the national intelligence function. To the private sector, it offers an unprecedented translation into lay terms of national intelligence principles and their application within and potentially outside of government.[1] Whereas "intelligence sharing" has traditionally been a government-to-government transaction, the environment is now receptive to government-private sector interaction.

The widespread trend toward incorporating government intelligence methodology into commerce and education was a primary impetus for publishing this document. As economic competition accelerates around the world, private businesses are initiating their own "business intelligence" (BI) or "competitive intelligence" services to advise their decisionmakers. Educators in business and academia are following suit, inserting BI concepts into professional training and college curricula.[2]

Whereas businesses in the past have concentrated on knowing the market and making the best product, they are shifting their focus to include knowing, and staying ahead of, competitors. This emphasis on competitiveness requires the sophisticated production and use of carefully analyzed information tailored to specific users; in other words, intelligence. But the use of intelligence as a strategic planning tool, common in government, is a skill that few companies have perfected.[3]

Although BI practitioners refer to the national security model of intelligence, they do not seek to conduct secret intelligence operations, which are limited by law to government

---

[1] For the purpose of this study, the author includes in national security intelligence those analogous activities conducted by law enforcement personnel at the federal, state, and local levels. Readers seeking further information on law enforcement applications of intelligence may wish to read Marilyn Peterson, *Applications in Criminal Analysis* (Westport, Connecticut: Greenwood Press, 1994). An additional resource is the International Association of Law Enforcement Intelligence Analysts. Local IALEIA chapters are listed on the Association's web site: http://www.ialeia.org.

[2] An authoritative guide to business intelligence practices is found in Larry Kahaner, *Competitive Intelligence: From Black Ops to Boardrooms — How Businesses Gather, Analyze and Use Information to Succeed in the Global Marketplace* (New York, NY: Simon and Schuster, 1996).

[3] Richard D'Aveni, "Hypercompetition," briefing to SCIP Conference, Alexandria, VA, 28 March 1996.

authorities. The Society of Competitive Intelligence Professionals (SCIP), headquartered in the Washington, DC area, is an international organization founded in 1986 to "assist members in enhancing their firms' competitiveness through a greater... understanding of competitor behaviors and future strategies as well as the market dynamics in which they do business."[4] SCIP's code of conduct specifically promotes ethical and legal BI practices.[5] The main focus of "collection" is on exploiting on-line and open-source information services, and the theme of "analysis" is to go beyond mere numerical and factual information, to interpretation of events for strategic decisionmaking.[6]

Large corporations are creating their own intelligence units, and a few are successful at performing analysis in support of strategic decisionmaking. Others are hiring BI contractors, or "out-sourcing" this function. However, the majority of businesses having some familiarity with BI are not able to conduct rigorous research and analysis for value-added reporting. According to University of Pittsburgh professor of Business Administration John Prescott, no theoretical framework exists for BI. He believes that most studies done lack the rigor that would come with following sound research-design principles. By his estimate, only one percent of companies have a research-design capability exploitable for BI applications.[7] At the same time, companies are increasingly opting to establish their own intelligence units rather than purchasing services from BI specialists. The implication of this trend is that BI professionals should be skilled in both intelligence and in a business discipline of value to the company.[8]

On the other hand, as businesses come to appreciate the value of intelligence about their competitors, they are increasingly realizing their own vulnerability to similar scrutiny. The private sector can therefore benefit from IC expertise in disciplines complementary to active intelligence production, namely defensive measures. The whole concept of openness regarding intelligence practices may hinge upon the counter-balancing effect of self-defense, particularly as practiced through information systems security (INFOSEC) and operations security (OPSEC).[9] Because the IC seeks to be a world leader in INFOSEC and OPSEC as well as intelligence production, defensive measures are an appropriate topic for dialogue between the public and private sectors.

The U.S. government INFOSEC Manual sums up the relationship between offense and defense in a comprehensive intelligence strategy in this way:

> In today's information age environment, control of information and information technology is vital. As the nation daily becomes more dependent on

9 These concepts are addressed in Part IX.

> networked information systems to conduct essential business, including military operations, government functions, and national and international economic enterprises, information infrastructures are assuming increased strategic importance. This has, in turn, given rise to the concept of information warfare (INFOWAR) — a new form of warfare directed toward attacking (offensive) or defending (defensive) such infrastructures.[10]

Giving citizens the tools they need to survive INFOWAR is one of the IC's explicit missions. This intelligence primer can assist that mission by offering a conceptual and practical "common operating environment" for business and government alike.[11]

Assessing and Exchanging Best Practices

In documenting the essentials of intelligence, this primer is an example of *benchmarking*, a widely used process for achieving quality in organizations, the use of which is a criterion for the business world's Malcolm Baldrige National Quality Award.[12] Benchmarking normally assesses best professional practices, developed and refined through experience, for carrying out an organization's core tasks.[13] An additional aim of benchmarking is to establish reciprocal relationships among best-in-class parties for the exchange of mutually beneficial information.[14] Because the IC is the *de facto* functional leader in the intelligence profession, and is publicly funded, it is obligated to lead both the government and private sector toward a greater understanding of the intelligence discipline.

In the mid-1990s, as national intelligence agencies began to participate in international benchmarking forums, individuals from the private sector began to request practical information on the intelligence process from IC representatives. The requestors were often participants in the growing BI movement and apparently sought to adapt IC methods to their own purposes. Their circumspect counterparts in the government were not prepared to respond to these requests, preferring instead to limit benchmarking relationships to common business topics, such as resource management.[15] Concurrently, the annual SCIP international conference highlighted the needs and capabilities of intelligence departments in the private sector.

---

[10] National Security Agency, *1995 INFOSEC Manual* (Ft. Meade, MD: NSA, 1995), para. C.1.

[11] Readers in doubt of the need for INFOSEC in the private sector may wish to study the real-world examples of INFOWAR battles and their implications for economic and personal security that author Winn Schwartau reveals in *Information Warfare: Chaos on the Electronic Superhighway*, (New York: Thunder's Mouth Press, 1994).

[12] A useful reference to benchmarking within the U.S. government is Jerry Frankenfield and Melissie Rumizen, *A Guide to Benchmarking* (Fort Meade, MD: National Security Agency (NSA), 12 July 1995). An overview of benchmarking in the private sector can be found in Dean Elmuti, Hanus Kathawaia, and Scott J. Lloyed, "The Benchmarking Process: Assessing Its Value and Limitations," *Industrial Management*, 39, No. 4 (July/August 1997): 12-19.

[14] Elmuti, Kathawaia and Lloyed, 13.

[15] Melissie C. Rumizen, Ph.D., Benchmarking Manager, National Security Agency, interview with the author, 2 April 1996.

Demand in the private sector for intelligence skills can be met through the application of validated intelligence practices presented in this document. Conversely, the business-oriented perspective on intelligence can be highly useful to government intelligence professionals. As a BI practitioner explains, every activity in the intelligence process must be related to a requirement, otherwise it is irrelevant.[16] Government personnel would benefit from this practical reminder in every training course and every work center. In the private sector, straying from this principle means wasting money and losing a competitive edge. The consequences of inefficient national intelligence can be costly on an even larger scale.

The basis for an IC benchmarking exchange with the private sector continues to grow. The Society of Competitive Intelligence Professionals is a clearinghouse for the review of private business intelligence practices, and therefore a champion of information sharing. Leading colleges and universities are beginning to offer coursework in intelligence methods, and in many cases intend to expand their offerings. Curriculum exchanges between private sector educators and the IC are encouraged by legislation and by Congressional Commission recommendations,[17] yet little such formal exchange has taken place.

Whereas government practitioners are the acknowledged subject-matter experts in intelligence methodology, the private sector offers a wealth of expertise in particular areas such as business management, technology, the global marketplace, and skills training. Each has valuable knowledge to share with the other, and experience gaps to fill. On the basis of these unique needs and capabilities, the public and private sectors can forge a new partnership in understanding their common responsibilities, and this primer may make a modest contribution toward the exchange of ideas.

The following chapters outline validated steps to operating an intelligence service for both the government and the private sector. In either setting, this document should prove useful as a basic curriculum for students, an on-the-job working aid for practitioners, and a reference tool for experienced professionals, especially those teaching or mentoring others. Although the primer does not exhaustively describe procedures for quality intelligence production or defensive measures, it does offer the business community fundamental concepts that can transfer readily from national intelligence to commercial applications, including competitive analysis, strategic planning and the protection of proprietary information. Universities may incorporate these ideas into their business, political science, and intelligence studies curricula to encourage and prepare students to become intelligence practitioners in commerce or government. For anyone outside of the

national security apparatus, this intelligence primer will shed light on why and how the government spends federal tax dollars on national intelligence.

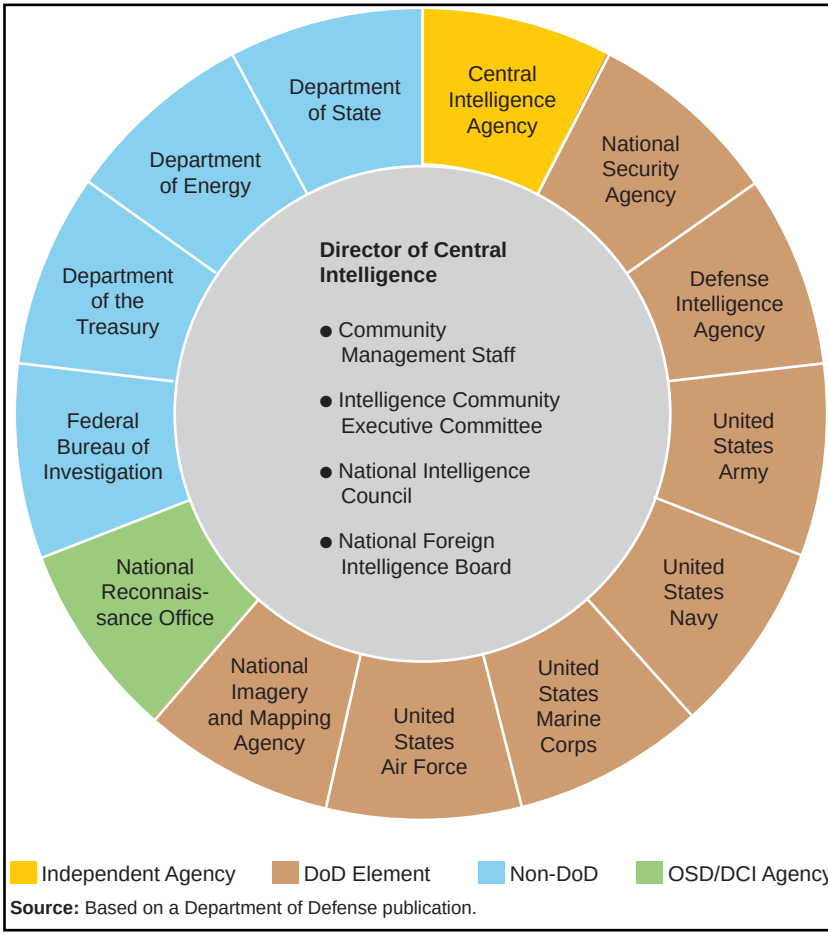

Figure 1: The National Intelligence Community.

PART I
INTELLIGENCE PROCESS

> [I]ntelligence is more than information. It is knowledge that has been specially prepared for a customer's unique circumstances. The word *knowledge* highlights the need for human involvement. Intelligence collection systems produce... data, not intelligence; only the human mind can provide that special touch that makes sense of data for different customers' requirements. The special processing that partially defines intelligence is the continual collection, verification, and analysis of information that allows us to understand the problem or situation in actionable terms and then tailor a product in the context of the customer's circumstances. If any of these essential attributes is missing, then the product remains information rather than intelligence.[18]

The intelligence profession, already well established within government, is growing in the private sector. Intelligence is traditionally a function of government organizations serving the decisionmaking needs of national security authorities. But innovative private firms are increasingly adapting the national security intelligence model to the business world to aid their own strategic planning. Although business professionals may prefer the term "information" over "intelligence," the author will use the latter term to highlight the importance of adding value to information. According to government convention, the author will use the term "customer" to refer to the intended recipient of an intelligence product — either a fellow intelligence service member, or a policy official or decisionmaker. The process of converting raw information into actionable intelligence can serve government and business equally well in their respective domains.

The Intelligence Process in Government and Business

Production of intelligence follows a cyclical *process*, a series of repeated and interrelated steps that add value to original inputs and create a substantially transformed product. That transformation is what distinguishes intelligence from a simple cyclical activity.[19] In government and private sector alike, analysis is the catalyst that converts information into intelligence for planners and decisionmakers.

Although the intelligence process is complex and dynamic, several component functions may be distinguished from the whole. In this primer, components are identified as Intelligence Needs, Collection Activities, Processing of Collected Information, Analysis and Production. To highlight the components, each is accorded a separate Part in this study. These

labels, and the illustration below, should not be interpreted to mean that intelligence is a unidimensional and unidirectional process. "[I]n fact, the [process] is multidimensional, multidirectional, and — most importantly — interactive and iterative."[20]

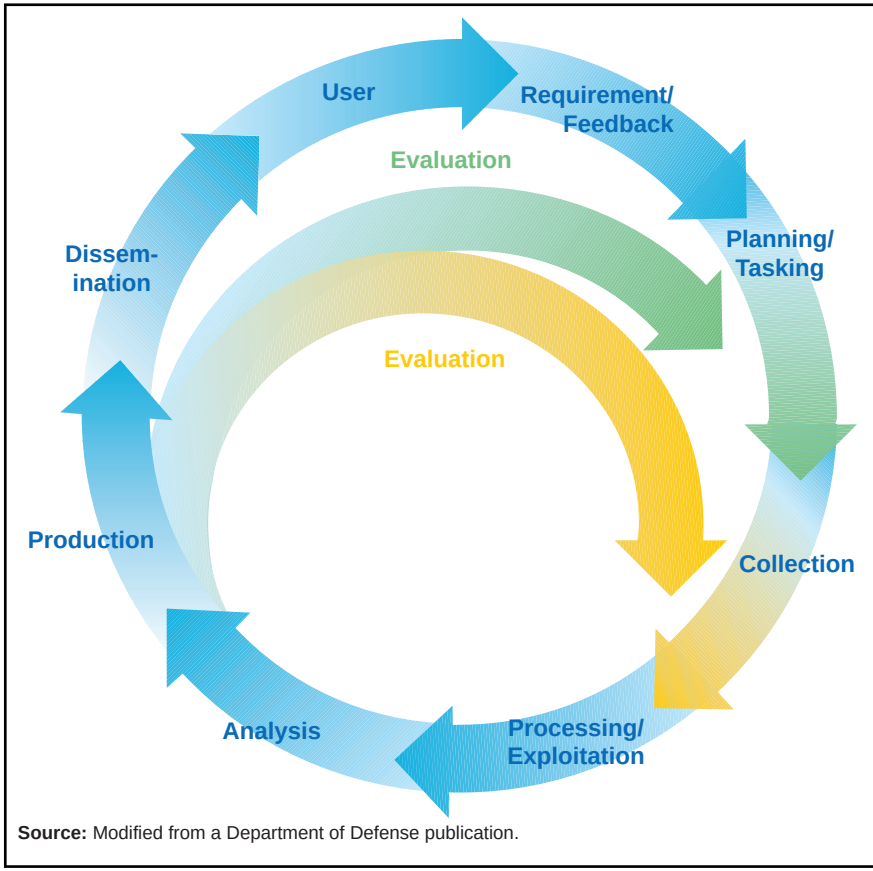

Figure 2: Process of Intelligence Creation and Use.

The purpose of this process is for the intelligence service to provide decisionmakers with tools, or "products" that assist them in identifying key decision factors. Such intelligence products may be described both in terms of their subject content and their intended use.[21]

Table 1: Types of Intelligence Product Categories
Source: adapted from Garst, "Components of Intelligence"

By Subject	By Use
Biographic	Research
Economic	Current
Geographic	Estimative
Military	Operational
Political	Scientific and Technical
Sociological	Warning
Scientific and Technical	
Transportation and Communications	

Any or all of these categories may be relevant to the private sector, depending upon the particular firm's product line and objectives in a given industry, market environment, and geographic area.

A nation's power or a firm's success results from a combination of factors, so intelligence producers and customers should examine potential adversaries and competitive situations from as many relevant viewpoints as possible. A competitor's economic resources, political alignments, the number, education and health of its people, and apparent objectives are all important in determining the ability of a country or a business to exert influence on others. The eight subject categories of intelligence are exhaustive, but they are not mutually exclusive. Although dividing intelligence into subject areas is useful for analyzing information and administering production, it should not become a rigid formula. Some intelligence services structure production into geographic subject areas when their responsibilities warrant a broader perspective than topical divisions would allow.[22]

---

[21] Ronald D. Garst, "Components of Intelligence," in *A Handbook of Intelligence Analysis*, ed. Ronald D. Garst, 2d ed. (Washington, DC: Defense Intelligence College, January 1989), 1; Central Intelligence Agency, *A Consumer's Guide to Intelligence* (Washington, DC: Public Affairs Staff, July 1995), 5-7.

[22] Garst, *Components of Intelligence*, 2,3.

Similarly, characterization of intelligence by intended use applies to both government and enterprise, and the categories again are exhaustive, but not mutually exclusive. The production of basic research intelligence yields structured summaries of topics such as geographic, demographic, and political studies, presented in handbooks, charts, maps, and the like. Current intelligence addresses day-to-day events to apprise decisionmakers of new developments and assess their significance. Estimative intelligence deals with what might be or what might happen; it may help policymakers fill in gaps between available facts, or assess the range and likelihood of possible outcomes in a threat or "opportunity" scenario. Operational support intelligence incorporates all types of intelligence by use, but is produced in a tailored, focused, and timely manner for planners and operators of the supported activity. Scientific and Technical intelligence typically comes to life in in-depth, focused assessments stemming from detailed physical or functional examination of objects, events, or processes, such as equipment manufacturing techniques.[23] Warning intelligence sounds an alarm, connoting urgency, and implies the potential need for policy action in response.

How government and business leaders define their needs for these types of intelligence affects the intelligence service's organization and operating procedures. Managers of this intricate process, whether in government or business, need to decide whether to make one intelligence unit responsible for all the component parts of the process or to create several specialized organizations for particular sub-processes. This question is explored briefly below, and more fully in Part VII.

Functional Organization of Intelligence

The national Intelligence Community comprises Executive Branch agencies that produce classified and unclassified studies on selected foreign developments as a prelude to decisions and actions by the president, military leaders, and other senior authorities. Some of this intelligence is developed from special sources to which few individuals have access except on a strictly controlled "need-to-know" basis.[24] The four categories of special intelligence are Human Resources (HUMINT), Signals (SIGINT), Imagery (IMINT) and Measurement and Signatures (MASINT). The four corresponding national authorities for these categories are the Central Intelligence Agency (CIA), the National Security Agency (NSA), the National Imagery and Mapping Agency (NIMA) and the Defense Intelligence Agency (DIA). DIA shares authority for HUMINT, being responsible for Department of Defense HUMINT management. Along with these four agencies, other members of the Intelligence Community use and produce intelligence by integrating all available and relevant collected information into reports tailored to the needs of individual customers.

Private sector organizations use open-source information to produce intelligence in a fashion similar to national authorities. By mimicking the government process of translating customer needs into production requirements, and particularly by performing rigorous analysis on gathered information, private organizations can produce assessments that aid their leaders in

---

[23] CIA, *Consumer's Guide*, 5-7.
[24] CIA, *Consumer's Guide*, vii.

planning and carrying out decisions to increase their competitiveness in the global economy. This primer will point out why private entities may desire to transfer into their domain some well-honed proficiencies developed in the national Intelligence Community. At the same time, the Intelligence Community self-examination conducted in these pages may allow government managers to reflect on any unique capabilities worthy of further development and protection.

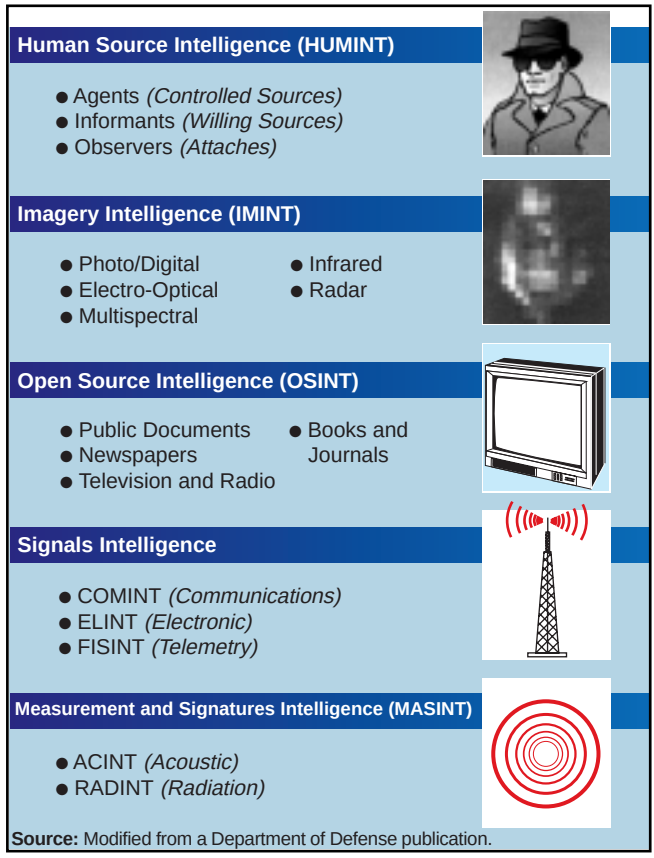

Figure 3: National Intelligence Production Resources.

PART II
CONVERTING CUSTOMER NEEDS INTO INTELLIGENCE REQUIREMENTS

> The articulation of the requirement is the most important part of the process, and it seldom is as simple as it might seem. There should be a dialogue concerning the requirement, rather than a simple assertion of need. Perhaps the customer knows precisely what is needed and what the product should look like. Perhaps... not. Interaction is required: discussion between ultimate user and principal producer. This is often difficult due to time, distance, and bureaucratic impediments, not to mention disparities of rank, personality, perspectives, and functions.[25]

Defining the Intelligence Problem

Customer demands, or "needs," particularly if they are complex and time-sensitive, require interpretation or analysis by the intelligence service before being expressed as intelligence requirements that drive the production process.[26] This dialog between intelligence producer and customer may begin with a simple set of questions, and if appropriate, progress to a more sophisticated analysis of the intelligence problem being addressed.

The "Five Ws" — *Who*, *What*, *When*, *Where*, and *Why* — are a good starting point for translating intelligence needs into requirements. A sixth related question, *How*, may also be considered. In both government and business, these questions form the basic framework for decisionmakers and intelligence practitioners to follow in formulating intelligence requirements and devising a strategy to satisfy them. Typically, government intelligence requirements are expressed in terms of foreign threats to national or international security. In business, requirements may be expressed in terms of the competitor's standing in the marketplace in comparison to one's own posture. Representative examples from each sector follow:

[25] Dearth, "National Intelligence," 17-18.
[26] Dearth, "National Intelligence," 18.

Table 2: Illustrative Definitions of Intelligence Problems and Customer Needs

Source: Author

A Government Scenario

The Intelligence Problem					
Who	***What***	***When***	***Where***	***Why***	***How***
A foreign president	Refusing to allow weapons sites to be inspected	Now; for several months	Country X	Unknown, possibly to hide illegal weapons	Barring access, destroying monitoring equipment
The Intelligence Need					
Who	***What***	***When***	***Where***	***Why***	***How***
U.S. President	Wants info on Country X President	Now, and update	White House	Determine power base and intent	All-source collection & analysis

A Business Scenario

The Intelligence Problem					
Who	***What***	***When***	***Where***	***Why***	***How***
Company X	Reorganizes production department	Sudden	Saturated market	Unknown	Unknown
The Intelligence Need					
Who	***What***	***When***	***Where***	***Why***	***How***
CEO of similar Company Y	Wants to know why and how Company X changed	ASAP	CEO's office	Determine if new structure gives advantage	Open source analysis; tailored, confidential report

Examination of these basic scenarios should inspire further development of the concept of determining customer needs in specific situations. The thoughtful researcher may propose, for example, ways to gather information on additional aspects of the problem (Who, What) and on customers (Who), as well as on the attendant motivations (Why) and strategies (How) of the target and the customer. Defining the intelligence problem in this manner paves the way for the next step in the intelligence process — the development of intelligence collection, analysis, and production *requirements*, explained later in this chapter.

Another, more complex model for defining intelligence scenarios employs the Taxonomy of Problem Types.[27] The table below illustrates the factors that customers and producers may take into account in articulating the nature of the intelligence problem and selecting a strategy for resolving it.

Table 3: Taxonomy of Problem Types

Source: Analysis course material, Joint Military Intelligence College, 1991

Characteristics	Problem Types				
	Simplistic	**Deterministic**	**Moderately Random**	**Severely Random**	**Indeterminate**
What is the question?	Obtain information	How much? How many	Identify and rank all outcomes	Identify outcomes in unbounded situation	Predict future events/ situations
Role of facts	Highest	High	Moderate	Low	Lowest
Role of judgment	Lowest	Low	Moderate	High	Highest
Analytical task	Find information	Find/create formula	Generate all outcomes	Define potential outcomes	Define futures factors
Analytical method	Search sources	Match data to formula	Decision theory; utility analysis	Role playing and gaming	Analyze models and scenarios
Analytical instrument	Matching	Mathematical formula	Influence diagram, utility, probability	Subjective evaluation of outcomes	Use of experts
Analytic output	Fact	Specific value or number	Weighted alternative outcomes	Plausible outcomes	Elaboration on expected future
Probability of error	Lowest	Very low	Dependent on data quality	High to very high	Highest
Follow-up task	None	None	Monitor for change	Repeated testing to determine true state	Exhaustive learning

[27] Morgan D. Jones, *The Thinker's Toolkit* (New York: Random House, 1995), 44-46, as elaborated by Thomas H. Murray, Sequoia Associates, Inc., Arlington, VA., in coursework at the Joint Military Intelligence College.

As with the "Five Ws," this model enables decisionmakers and analysts to assess their needs and capabilities in relation to a particular intelligence scenario. This ability to establish a baseline and set in motion a collection and production strategy is crucial to conducting a successful intelligence effort. Too often, both producers and customers waste valuable time and effort struggling to characterize for themselves a given situation, or perhaps worse, they hastily embark upon an action plan without determining its appropriateness to the problem. Employing a structured approach as outlined in the Taxonomy of Problem Types can help the players avoid these inefficiencies and take the first step toward generating clear intelligence requirements by defining both the intelligence problem and the requisite components to its solution. Following are example scenarios. The reader is encouraged to follow the scenarios down the columns of the taxonomy table, then generate new scenarios in similar fashion.

Intelligence Problem Definition

A Government Scenario

The Severely Random problem type is one frequently encountered by the military in planning an operational strategy. This is the realm of wargaming. The initial intelligence problem is to identify all possible outcomes in an unbounded situation, so that commanders can generate plans for every contingency. The role of valid data is relatively minor, while the role of judgment is great, as history and current statistics may shed little light on how the adversary will behave in a hypothetical situation, and the progress and outcome of an operation against that adversary cannot be predicted with absolute accuracy. Therefore, the analytical task is to define and prepare for all potential outcomes. The analytical method is role playing and wargaming: placing oneself mentally in the imagined situation, and experiencing it in advance, even to the point of acting it out in a realistic setting. After experiencing the various scenarios, the players subjectively evaluate the outcomes of the games, assessing which ones may be plausible or expected to occur in the real world. The probability of error in judgment here is inherently high, as no one can be certain that the future will occur exactly as events unfolded in the game. However, repeated exercises can help to establish a measure of confidence, for practice in living out these scenarios may enable the players to more quickly identify and execute desired behaviors, and avoid mistakes in a similar real situation.

A Business Scenario

The Indeterminate problem type is one facing the entrepreneur in the modern telecommunications market. Predicting the future for a given proposed new technology or product is an extremely imprecise task fraught with potentially dire, or rewarding, consequences. The role of valid data is extremely minor here, whereas analytical judgments about the buying public's future — and changing — needs and desires are crucial. Defining the key factors influencing the future market is the analytical task, to be approached via the analytical method of setting up models and scenarios: the if/then/else process. Experts in the proposed technology or market are then employed to analyze these possibilities. Their output is a synthesized assessment of how the future will look under various conditions with regard to the

proposed new product. The probability of error in judgment is extremely high, as the decision is based entirely on mental models rather than experience; after all, neither the new product nor the future environment exists yet. Continual reassessment of the changing factors influencing the future can help the analysts adjust their conclusions and better advise decisionmakers on whether, and how, to proceed with the new product.

Generating Intelligence Requirements

Once they have agreed upon the nature of the intelligence problem at hand, the intelligence service and the customer together can next generate intelligence *requirements* to drive the production process. The intelligence requirement translates customer needs into an intelligence action plan. A good working relationship between the two parties at this stage will determine whether the intelligence produced in subsequent stages actually meets customer needs. However, the differing perspectives that each side brings to the negotiation process can make cooperation between them a difficult feat.[28]

Customers want intelligence to guide them clearly in making policy and operational decisions. They may have little understanding of the intelligence process, and little patience for the subjectivity and conditionality of intelligence judgments. For customers, intelligence can be just one of many influences on their decisionmaking, and may be given little weight in comparison to other, more readily digested, familiar, or policy-oriented inputs. However, intelligence is neither designed nor equipped to meet these customer expectations.[29]

As a discipline, intelligence seeks to remain an independent, objective advisor to the decisionmaker. The realm of intelligence is that of "fact," considered judgment, and probability, but not prescription. It does not tell the customer what to do to meet an agenda, but rather, identifies the factors at play, and how various actions may affect outcomes. Intelligence tends to be packaged in standard formats and, because of its methodical approach, may not be delivered within the user's ideal timeframe. For all these reasons, the customer may not see intelligence as a useful service.[30]

Yet, somehow the intelligence producer and customer must reconcile their differing perspectives in order to agree on intelligence requirements and make the production process work. Understanding each other's views on intelligence is the first step toward improving the relationship between them. The next step is communication. Free interaction among the players will foster agreement on intelligence priorities and result in products that decisionmakers recognize as meaningful to their agendas, yet balanced by rigorous analysis.[31] In addition, as discussed below, customer feedback on production quality will lead to better definition of future intelligence problems and requirements.

[31] Adapted from Michael A. Turner, "Setting Analytical Priorities in U.S. Intelligence," *International Journal of Intelligence and CounterIntelligence*, 9, No. 3, (Fall 1996): 320-322.

Types of Intelligence Requirements

Having thus developed an understanding of customer needs, the intelligence service may proactively and continuously generate intelligence collection and production requirements to maintain customer-focused operations. Examples of such internally generated specifications include analyst-driven, events-driven, and scheduled requirements. The table below briefly describes them.[32]

Table 4: Types of Producer-Generated Intelligence Collection and Production Requirements

Source: Hulnick

Analyst-driven	Based on knowledge of customer and issues
Events-driven	In response to time-sensitive relevant events
Scheduled	Periodic activities to document and update target status

Further distinctions among intelligence requirements include timeliness and scope, or level, of intended use. Timeliness of requirements is established to meet standing (long-term) and *ad hoc* (short-term) needs. When the customer and intelligence service agree to define certain topics as long-term intelligence issues, they generate a standing requirement to ensure that a regular production effort can, and will, be maintained against that target. The customer will initiate an *ad hoc* requirement upon realizing a sudden short-term need for a specific type of intelligence, and will specify the target of interest, the coverage timeframe, and the type of output desired.

The scope or level of intended use of the intelligence may be characterized as strategic or tactical. Strategic intelligence is geared to a policymaker dealing with big-picture issues affecting the mission and future of an organization: the U.S. President, corporate executives, high-level diplomats, or military commanders of major commands or fleets. Tactical intelligence serves players and decisionmakers "on the ground" engaged in current operations: trade negotiators, marketing and sales representatives, deployed military units, or product developers.

Table 5: Types of Customer-Defined Intelligence Requirements

Source: Author

Timeliness	Short-term *(ad hoc)*	Long-term (standing)
Scope	Broad (strategic)	Narrow (tactical)

[32] Adapted from Arthur S. Hulnick, "Managing Intelligence Analysis: Strategies for Playing the End Game," *International Journal of Intelligence and CounterIntelligence* 2, No. 3 (Fall 1988): 327.

Ensuring that Requirements Meet Customer Needs

Even when they follow this method of formulating intelligence requirements together, decisionmakers and their intelligence units in the public and private sectors may still have an incomplete grasp of how to define their needs and capabilities — until they have evaluated the resultant products. Thus, customer feedback, production planning and tasking, as well as any internal product evaluation, all become part of the process of defining needs and creating intelligence requirements. However, when intelligence producers and users are not in nearly direct, daily contact, this process can consume a good deal of time. This is why the national Intelligence Community is experimenting with compressing both the accustomed time and spatial dimensions of the intelligence process through remote electronic collaboration and production methods.[33]

Whether in business or government, six fundamental values or attributes underlie the core principles from which all the essential intelligence functions are derived. The corollary is that intelligence customers' needs may be defined and engaged by intelligence professionals using these same values. Table 6 offers a brief explanation of how both intelligence customers and producers may use these values to evaluate how well they have translated needs into requirements that will result in useful products.[34]

Interpretation of these values turns a customer's need into a collection and production requirement that the intelligence service understands in the context of its own functions. However, illustrating the complexity of the intelligence process, once this is done, the next step is not necessarily collection.

Rather, the next stage is analysis. Perhaps the requirement is simply and readily answered — by an existing product, by ready extrapolation from files or data bases, or by a simple phone call or short desk note based on an analyst's or manager's knowledge. On the other hand, the requirement might necessitate laborious effort — extrapolation, collation, analysis, integration, and production — but still the product can be constructed and sent directly to the requester. Case closed; next problem.... Preliminary analysis might well show, however, that while much data exists, because the issue at hand is not a new one, gaps in information must be filled... Obviously, this calls for collection. This brings up an essential point: consumers do not drive collection *per se*; analysts do — or should.[35] Part III explores this next step in the intelligence process.

---

[33] The U.S. military has pioneered the concept of an electronic intelligence operating environment that transcends organizational boundaries. Congress has recommended that the IC adopt this *Joint Intelligence Virtual Architecture* model to take advantage of technological developments, reduce bureaucratic barriers, and thereby provide policymakers with timely, objective, and useful intelligence. See U.S. Congress Staff Study, House Permanent Select Committee on Intelligence, *IC21: The Intelligence Community in the 21st Century,* (April 1996): Section III, "Intelligence Requirements Process."

[34] The six values are adapted by Brei from an earlier version of U.S. Department of Defense, Joint Chiefs of Staff, Joint Pub 2-0, *Joint Doctrine for Intelligence Support to Operations* (Washington, DC: GPO, 5 May 1995), IV-15.

[35] Dearth, "National Intelligence," 18-19.

Table 6: Intelligence Values

Source: Brei

Accuracy: All sources and data must be evaluated for the possibility of technical error, misperception, and hostile efforts to mislead.
Objectivity: All judgments must be evaluated for the possibility of deliberate distortions and manipulations due to self-interest.
Usability: All intelligence communications must be in a form that facilitates ready comprehension and immediate application. Intelligence products must be compatible with a customer's capabilities for receiving, manipulating, protecting, and storing the product.
Relevance: Information must be selected and organized for its applicability to a customer's requirements, with potential consequences and significance of the information made explicit to the customer's circumstances.
Readiness: Intelligence systems must be responsive to the existing and contingent intelligence requirements of customers at all levels of command.
Timeliness: Intelligence must be delivered while the content is still actionable under the customer's circumstances.

PART III
COLLECTION

The collection function rests on research — on matching validated intelligence objectives to available sources of information, with the results to be transformed into usable intelligence. Just as within needs-definition, analysis is an integral function of collection.

Collection Requirements

The collection *requirement* specifies exactly how the intelligence service will go about acquiring the intelligence information the customer needs. Any one, or any of several, players in the intelligence system may be involved in formulating collection requirements: the intelligence analyst, a dedicated staff officer, or a specialized collection unit.

In large intelligence services, collection requirements may be managed by a group of specialists acting as liaisons between customers and collectors (people who actually obtain the needed information, either directly or by use of technical means). Within that requirements staff, individual requirements officers may be dedicated to a particular set of customers, a type of collection resource, or a specific intelligence issue. This use of collection requirements officers is prevalent in the government. Smaller services, especially in the private sector, may assign collection requirements management to one person or team within a multidisciplinary intelligence unit that serves a particular customer or that is arrayed against a particular topic area.

Regardless of how it is organized, the requirements management function entails much more than simple administrative duties. It requires analytic skill to evaluate how well the customer has expressed the intelligence need; whether, how and when the intelligence unit is able to obtain the required information through its available collection sources; and in what form to deliver the collected information to the intelligence analyst.

Collection Planning and Operations

One method for selecting a collection strategy is to first prepare a list of expected target evidence. The collection requirements officer and the intelligence analyst for the target may collaborate in identifying the most revealing evidence of target activity, which may include physical features of terrain or objects, human behavior, or natural and man-made phenomena. The issue that can be resolved through this analysis is “What am I looking for, and how will I know it if I see it”?

Successful analysis of expected target evidence in light of the customer’s needs can determine what collection source and method will permit detection and capture of that evidence. Increasingly sophisticated identification of evidence types may reveal what collectible data are essential for drawing key conclusions, and therefore should be given priority; whether the evidence is distinguishable from innocuous information; and whether the intelligence service has the skills, time, money and authorization to collect the data

needed to exploit a particular target. Furthermore, the collection must yield information in a format that is either usable in raw form by the intelligence analyst, or that can be converted practicably into usable form.

For example, in the case of the first business scenario presented in Part II, the CEO needs intelligence on why and how the similar, competitor company suddenly reorganized its production department. The collection requirement might specify that the intelligence unit give first priority to this new issue; it will focus on collecting information about the competitor's reorganization. A list of relevant evidence might include the following: changes in personnel assignments, changes in supply of production components, budget deficit or surplus, age of infrastructure, breakthroughs in research and development, and changes in the cultural or natural environment. To exploit this evidence, the intelligence service would thus need direct or indirect access to information on the company's employees, its previous production methods, its financial status, its physical plant, its overall functional structure and operations, and the consumer market. The collection unit would choose from among the sources listed in Table 7 below those most likely to provide timely access to this information in usable form.

Finally, upon defining the collection requirement and selecting a collection strategy, the intelligence unit should implement that strategy by tasking personnel and resources to exploit selected sources, perform the collection, re-format the results if necessary to make them usable in the next stages, and forward the information to the intelligence production unit. This aspect of the collection phase may be called collection operations management. As with requirements management, it is often done by specialists, particularly in the large intelligence service. In smaller operations, the same person or team may perform some or all of the collection-related functions.

The small, multidisciplinary intelligence unit may experience certain benefits and disadvantages in managing multiple phases of the intelligence process at the same time. In comparison to the large, compartmentalized service, the smaller unit will likely experience greater overall efficiency of operations and fewer bureaucratic barriers to customer service. The same few people may act as requirements officers, operations managers and intelligence analysts/producers, decreasing the likelihood of communication and scheduling problems among them. This approach may be less expensive in terms of infrastructure and logistics than a functionally divided operation. On the other hand, the financial and time investment in training each individual in every facet of the intelligence process may be substantial. Furthermore, careful selection and assignment of personnel who thrive in a multidisciplinary environment will be vital to the unit's success, to help ward off potential worker stress and overload. An additional pitfall that the small unit should strive to avoid is the tendency to be self-limiting: overreliance on the same customer contacts, collection sources and methods, analytic approaches, and production formulas can lead to stagnation and irrelevance. The small intelligence unit should be careful to invest in new initiatives that keep pace with changing times and customer needs.

Collection Sources

The range of sources available to all intelligence analysts, including those outside of government, is of course much broader than the set of restricted, special sources available only for government use. U.S. government collection of information for intelligence purposes is channelled through the recognized intelligence collection disciplines described in Part I. From a different perspective, four general categories serve to identify the types of information sources available to the intelligence analyst: people, objects, emanations, and records. Strictly speaking, the information offered by these sources may not be called intelligence if the information has not yet been converted into a value-added product. In the government or private sector, collection may be performed by the reporting analyst or by a specialist in one or more of the collection disciplines. The following table, derived from Clauser and Weir, illustrates the distinct attributes offered by the four sources of intelligence.[36]

Table 7: Categories of Intelligence Sources by Analytic Use

Source: Adapted from Clauser and Weir

Source	Related Collection Discipline(s) and Source Attributes	Analytic Use
People	HUMINT; subject-matter experts, professional researchers, information specialists, eyewitnesses or participants	Transfer of first-hand knowledge, referral to other sources
Objects	IMINT; physical characteristics of equipment, materials, or products, such as texture, shape, size, and distinctive markings	Basis for emotive but objective reporting on composition, condition, origin, or human purpose
Emanations	MASINT, SIGINT; detectable phenomena given off by natural or man-made objects; electromagnetic energy, heat, sound, footprints, fingerprints, and chemical and material residues	Scientific and technical analysis
Records	IMINT, SIGINT, symbolic (written and oral reports, numerical tabulations) or non-symbolic (images, electro-magnetic recordings of data)	Research, background information, translation, conversion to usable form

[36] Jerome K. Clauser and Sandra M. Weir, *Intelligence Research Methodology: An Introduction to Techniques and Procedures for Conducting Research in Defense Intelligence* (Washington, DC: Defense Intelligence School, 1975), 111-117.

The following table offers examples from government and business of each source type.

Table 8: Comparison of Illustrative Intelligence Sources from Government and Business

Source: Author

Source	Information Provided	Government	Business
People	Inadvertent or intentional revelation by a person in a casual encounter, official meeting, or informant relationship	A foreign diplomat	A fellow exhibitor at a trade show
Objects	Physical and functional characteristics of the item, discerned through physical or visual examination	Military equipment	Products or components
Emanations	Clues about the identity and activities of the originator	Intercepted communications	Trace chemicals in factory effluent
Records	Evidence of existence and characteristics of target entities	Imagery, telemetry, documents	Product literature

The collection phase of the intelligence process thus involves several steps: translation of the intelligence need into a collection requirement, definition of a collection strategy, selection of collection sources, and information collection. The resultant collected information must often undergo a further conversion before it can yield intelligence in the analysis stage. Processing of collected information into intelligence information is addressed in the following Part of this primer.

PART IV
PROCESSING COLLECTED INFORMATION

From Raw Data to Intelligence Information

No matter what the setting or type of collection, gathered information must be packaged meaningfully before it can be used in the production of intelligence. Processing methods will vary depending on the form of the collected information and its intended use, but they include everything done to make the results of collection efforts usable by intelligence producers. Typically, "processing" applies to the techniques used by government intelligence services to transform raw data from special-source technical collection into intelligence *information*.[37]

> While collectors collect "raw" information, certain [collection] disciplines involve a sort of *pre-analysis* in order to make the information "readable" to the average all-source analyst. For instance: imagery analysts "read-out" the basic information on the image; foreign language broadcasts must be literally translated by linguists and analyzed for linguistic "context"; electronic signals require sorting out to be intelligible to the uninitiated in that arcane art; agent reports also need literal translations and perhaps comments as to access, context, assumed or proven past veracity.[38]

In the private sector, some processing activities are analogous to those of the government. Interpreting and annotating open-source information for a business intelligence service may include: marking locations of interest on a map or photograph, "translating" press releases or technical reports, transcribing the words of a speaker from video or audiotape into text, or drafting a detailed commentary from a personal interview.

Another term for processing, *collation*, encompasses many of the different operations that must be performed on collected information or data before further analysis and intelligence production can occur. More than merely physically manipulating information, collation organizes the information into a usable form, adding meaning where it was not evident in the original. Collation includes gathering, arranging, and annotating related information; drawing tentative conclusions about the relationship of "facts" to each other and their significance; evaluating the accuracy and reliability of each item; grouping items into logical categories; critically examining the information source; and assessing the meaning and usefulness of the content for further analysis. Collation reveals information

---

[37] The Department of Defense defines intelligence information as "unprocessed data of every description which may be used in the production of intelligence." (Department of Defense, Joint Chiefs of Staff, Joint Pub 1-02, *Dictionary of Military and Associated Terms* (Washington, DC: 23 March 1994), 184.)

[38] Dearth, "National Intelligence," 19.

gaps, guides further collection and analysis, and provides a framework for selecting and organizing additional information.[39]

Examples of collation include filing documents, condensing information by categories or relationships, and employing electronic database programs to store, sort, and arrange large quantities of information or data in preconceived or self-generating patterns. Regardless of its form or setting, an effective collation method will have the following attributes:

1. Be impersonal. It should not depend on the memory of one analyst; another person knowledgeable in the subject should be able to carry out the operation.

2. Not become the "master" of the analyst or an end in itself.

3. Be free of bias in integrating the information.

4. Be receptive to new data without extensive alteration of the collating criterion.[40]

Evaluating and Selecting Evidence

To prepare collected information for further use, one must evaluate its relevance and value to the specific problem at hand. An examination of the information's *source* and *applicability* to the intelligence issue can determine whether that information will be further employed in the intelligence production process. Three aspects to consider in evaluating the relevance of information sources are reliability, proximity, and appropriateness.

Reliability of a source is determined through an evaluation of its past performance; if the source proved accurate in the past, then a reasonable estimate of its likely accuracy in a given case can be made. A human source's own testimony of reliability may also be taken into account; qualifiers such as "certain," "believe," and "guess" indicate how sure the source is of the information being conveyed. However, if the source is completely untested, then evaluation of the information must be done solely on its own merits, independent of its origin.[41]

Proximity refers to the source's closeness to the information. The direct observer or participant in an event may gather and present evidence directly, but in the absence of such firsthand information, the analyst must rely on sources with varying degrees of proximity to

[40] Mathams, 86.

[41] adapted from Gary Harris, "Evaluating Intelligence Evidence," in *A Handbook of Intelligence Analysis*, ed. Ronald D. Garst, 2d ed. (Washington, DC: Defense Intelligence College, January 1989), 34-35. For an in-depth treatment of evidence evaluation techniques and factors, see David A. Schum, *Evidence and Inference for the Intelligence Analyst*, Vols. I and II (Lanham, MD: University Press of America, 1987).

the situation. A primary source passes direct knowledge of an event on to the analyst. A secondary source provides information twice removed from the original event; one observer informs another, who then relays the account to the analyst. Such regression of source proximity may continue indefinitely, and naturally, the more numerous the steps between the information and the source, the greater the opportunity for error or distortion.[42]

Appropriateness of the source rests upon whether the source speaks from a position of authority on the specific issue in question. As no one person or institution is an expert on all matters, the source's individual capabilities and shortcomings affect the level of validity or reliability assigned to the information it provides regarding a given topic.[43]

The following examples illustrate the use of reliability, proximity, and appropriateness to evaluate a source.

> The mail clerk at 3rd Army Headquarters told me that, according to the 1st Armored Division Supply Officer, the Division is being deployed to Site Y in three days.

The reliability of the mail clerk as a source (questionable), his proximity to the information (secondary), and the appropriateness of the Supply Officer as a source on the fact of deployment (uncertain), make this information of little value to the intelligence production process.

> A major national newspaper published an interview with the CEO of Big Company, quoting the CEO's announcement of a merger the company had just secretly concluded with Large Company.

The reliability of a major national newspaper as a source (good), its proximity to the information (secondary), and the appropriateness of the CEO as the source of the merger announcement (high) make this information of high value to intelligence production.

Three aspects of the information itself have a bearing on its applicability to intelligence issues: plausibility, expectability, and support. *Plausibility* refers to whether the information is true under any circumstances or only under certain conditions, either known or possible. *Expectability* is assessed in the context of the analyst's prior knowledge of the subject. *Support* for information exists when another piece of evidence corroborates it — either the same information from a different source, or different information that points to the same conclusion.[44]

For example, a source contends that the President of Country X recently died, but the death is being kept secret from all but a few members of his regime. Although unusual, this information is plausible, and even has precedent in history. The scenario may meet the expectability criterion, if the country or this particular regime is known to be

---

[42] Harris, 35.
[43] adapted from Harris, 36.
[44] adapted from Harris, 36-38.

extremely secretive and paranoid about being vulnerable to hostile internal or external takeover movements. Support for this information may come from the same source providing details on the President's secret burial ceremony, or a different source, such as an actor who was hired to play the part of the President in a false Presidential address televised to the nation.

All these factors of source and content contribute to an initial assessment of the value of a particular piece of information to the intelligence production process. Those pieces that are judged to be useful may then undergo further scrutiny in light of customer needs, while items of questionable value may be rejected or set aside for further processing and comparison with other information. This initial selection of intelligence information sets the stage for intelligence analysis and production, as explained in the following Parts of the primer.

PART V
ANALYSIS

> Analysis is the breaking down of a large problem into a number of smaller problems and performing mental operations on the data in order to arrive at a conclusion or a generalization. It involves close examination of related items of information to determine the extent to which they confirm, supplement, or contradict each other and thus to establish probabilities and relationships.
>
> — *Mathams, 88.*

Analysis is not merely reorganizing data and information into a new format. At the very least, analysis should fully *describe* the phenomenon under study, accounting for as many relevant variables as possible. At the next higher level of analysis, a thorough *explanation* of the phenomenon is obtained, through interpreting the significance and effects of its elements on the whole. Ideally, analysis can reach successfully beyond the descriptive and explanatory levels to synthesis and effective persuasion, often referred to as *estimation*.

The *purpose* of intelligence analysis is to reveal to a specific decisionmaker the underlying significance of selected target information. Frequently intelligence analysis involves estimating the likelihood of one possible outcome, given the many possibilities in a particular scenario. This function is not to be confused with prediction, as no one can honestly be credited with predicting the future. However, intelligence analysis does appropriately involve forecasting, "which requires the explicit statement by the analyst of the degree of confidence held in a certain set of judgments, based upon a certain set of explicit facts or assumptions."[45] Different levels of analysis result in corresponding levels of conclusions that may be traced along an "Intelligence Food Chain."[46] This concept, illustrated in the following table, is equally applicable in government and business intelligence.

Table 9: The Intelligence Food Chain

Source: adapted from Davis, Analytic Tradecraft

Facts	verified information related to an intelligence issue (for example: events, measured characteristics).
Findings	expert knowledge based on organized information that indicates, for example, what is increasing, decreasing, changing, taking on a pattern.
Forecasts	judgments based on facts and findings and defended by sound and clear argumentation.
Fortunetelling	inadequately explained and defended judgments.

[45] Dearth, "National Intelligence," 25.

[46] Adapted from Jack Davis, *Intelligence Changes in Analytic Tradecraft in CIA's Directorate of Intelligence*, (Washington, DC: CIA Directorate of Intelligence, April 1995), 6.

Intelligence analysts may use this Food Chain model to measure their adherence to rigorous analytic thought — how far to go with their analytic judgments, and where to draw the line. The mnemonic "Four Fs Minus One" may serve as a reminder of how to apply this criterion. Whenever the intelligence information allows, and the customer's validated needs demand it, the intelligence analyst will extend the thought process as far along the Food Chain as possible, to the third "F" but not beyond to the fourth.

Types of Reasoning

Objectivity is the intelligence analyst's primary asset in creating intelligence that meets the Four Fs Minus One criterion. More than simply a conscientious attitude, objectivity is "a professional ethic that celebrates tough-mindedness and clarity in applying rules of evidence, inference, and judgment."[47] To produce intelligence objectively, the analyst must employ a process tailored to the nature of the problem. Four basic types of reasoning apply to intelligence analysis: induction, deduction, abduction and the scientific method.

Induction. The induction process is one of discovering relationships among the phenomena under study. For example, an analyst might discover from systematic examination of media reports that Country "X" had been issuing aggressive statements prior to formally announcing an arms agreement with Country "Y." Or an analyst may notice that a characteristic sequence of events always precedes Country "Z's" nuclear weapons tests.[48] In the words of Clauser and Weir:

> Induction is the intellectual process of drawing generalizations on the basis of observations or other evidence. Induction takes place when one learns from experience. For example, induction is the process by which a person learns to associate the color red with heat and heat with pain, and to generalize these associations to new situations.
>
> Induction occurs when one is able to postulate causal relationships. Intelligence estimates are largely the result of inductive processes, and, of course, induction takes place in the formulation of every hypothesis. Unlike other types of intellectual activities such as deductive logic and mathematics, there are no established rules for induction.[49]

Deduction. "Deduction is the process of reasoning from general rules to particular cases. Deduction may also involve drawing out or analyzing premises to form a conclusion."[50] In the case of Country "Z" above, the analyst noted a pattern of events related to testing of nuclear weapons. Later, after noticing this series of events occurring in Country "Z," the analyst may conclude that another nuclear weapons test is about to take place in that coun-

[50] clauser and Weir, 81.

try. The first premise, that certain events were related to weapons testing, was derived inductively — from specific observations to a conclusion. The second premise, that another test was imminent, was derived deductively — from a generalization to a specific case.[51]

Deduction works best in closed systems such as mathematics, formal logic, or certain kinds of games in which all the rules are clearly spelled out. For example, the validity and truthfulness of the following conclusion is apparent to anyone with a knowledge of geometry: "This is a triangle, therefore the sum of the interior angles will equal 180 degrees." In closed systems, properly drawn deductive conclusions are always valid.[52]

However, intelligence analysis rarely deals with closed systems, so premises assumed to be true may in fact be false, and lead to false conclusions. For example, in the weapons testing case above, Country "Z" may have deliberately deceived potential observers by falsely staging activities similar to those usually taken before a real weapons test. A conclusion that observed activities signalled a real test would be false in this case. Thus, as human activities rarely involve closed systems, deduction must be used carefully in intelligence analysis.[53]

Readers interested in further study into the use of deductive logic in estimative intelligence may wish to read the work of Israeli intelligence analyst Isaac Ben-Israel on this subject.[54] At the Joint Military Intelligence College, one student, Navy Lieutenant Donald Carney, explored the application of deductive logic to intelligence collection and analysis decisions in estimating the disintegration of Yugoslavia. Carney showed that Ben-Israel's "critical method" of inquiry could be applied prospectively to the collection of information to refute specific hypotheses, allowing for an unusually definitive estimate of the likelihood of each outcome.[55]

Abduction. Abduction is the process of generating a novel hypothesis to explain given evidence that does not readily suggest a familiar explanation. This process differs from induction in that it adds to the set of hypotheses available to the analyst. In inductive reasoning, the hypothesized relationship among pieces of evidence is considered to be already existing, needing only to be perceived and articulated by the analyst. In abduction, the analyst creatively generates an hypothesis, then sets about examining whether the available evidence unequivocally leads to the new conclusion. The latter step, testing the evidence, is a deductive inference.[56]

[56] David A. Schum, *Evidence and Inference for the Intelligence Analyst*, Volume I (Lanham, MD: University Press of America, 1987): 20.

Abductive reasoning may also be called intuition, inspiration, or the "Ah-ha!" experience. It characterizes the analyst's occasional ability to come to a conclusion spontaneously, often without a sense of having consciously taken definable steps to get there. While the abduction process may not be easily defined or taught, it may be encouraged by providing analysts with a wide array of research material and experiences, and by supporting the expenditure of time and energy on creative thinking.[57]

Examples of abductive reasoning in intelligence analysis include situations in which the analyst has a nagging suspicion that something of intelligence value has happened or is about to happen, but has no immediate explanation for this conclusion. The government intelligence analyst may conclude that an obscure rebel faction in a target country is about to stage a political coup, although no overt preparations for the takeover are evident. The business analyst may determine that a competitor company is on the brink of a dramatic shift from its traditional product line into a new market, even though its balance sheet and status in the industry are secure. In each case, the analyst, trusting this sense that the time is right for a significant event, will set out to gather and evaluate evidence in light of the new, improbable, yet tantalizing hypothesis.

Scientific Method. The scientific method combines deductive and inductive reasoning: Induction is used to develop the hypothesis, and deduction is used to test it. In science, the analyst obtains data through direct observation of the subject and formulates an hypothesis to explain conclusions suggested by the evidence. Experiments on the subject are devised and conducted to test the validity of the hypothesis. If the experimental results match the expected outcome, then the hypothesis is validated; if not, then the analyst must develop a new hypothesis and appropriate experimental methods.[58]

In intelligence analysis, the analyst typically does not have direct access to the observable subject, but gathers information indirectly. From these gathered data, the intelligence analyst may proceed with the scientific method by generating tentative explanations for a subject event or phenomenon. Next, each hypothesis is examined for plausibility and compared against newly acquired information, in a continual process toward reaching a conclusion. Often the intelligence analyst tests several hypotheses at the same time, whereas the scientist usually focuses on one at a time. Furthermore, intelligence analysts cannot usually experiment directly upon the subject matter as in science, but must generate fictional scenarios and rigorously test them through mental processes such as those suggested below.[59]

---

[57] The relationship of this type of reasoning to Eastern philosophy is addressed in LCDR William G. Schmidlin, USN, *Zen and the Art of Intelligence Analysis*, MSSI Thesis (Washington, DC: Joint Military Intelligence College, July 1993).

[58] Mathams, 91. A seminal contribution to understanding scientific method is Abraham Kaplan's *The Conduct of Inquiry* (San Francisco, CA: Chandler, 1964). The applicability of this method in social science, and therefore, in intelligence, is developed in Earl Babbie's *The Practice of Social Research* (Belmont, CA: Wadsworth Publishing Co, 1992).

[59] Mathams, 91.

Methods of Analysis

Opportunity Analysis. Opportunity analysis identifies for policy officials opportunities or vulnerabilities that the customer's organization can exploit to advance a policy, as well as dangers that could undermine a policy.[60] It identifies institutions, interest groups, and key leaders in a target country or organization that support the intelligence customer's objective; the means of enhancing supportive elements; challenges to positive elements (which could be diminished or eliminated); logistic, financial, and other vulnerabilities of adversaries; and activities that could be employed to rally resources and support to the objective.[61] Jack Davis notes that in the conduct of opportunity analysis,

> [T]he analyst should start with the assumption that every policy concern can be transformed into a legitimate intelligence concern. What follows from this is that analysts and their managers should learn to think like a policymaker in order to identify the issues on which they can provide utility, but they should always [behave like intelligence producers]. ... The first step in producing effective opportunity analysis is to redefine an intelligence issue in the policymaker's terms. This requires close attention to the policymaker's role as "action officer" - reflecting a preoccupation with getting things started or stopped among adversaries and allies.... It also requires that analysts recognize a policy official's propensity to take risk for gain....[P]olicymakers often see, say, a one-in-five chance of turning a situation around as a sound investment of [organizational] prestige and their professional energies....[A]nalysts have to search for appropriate ways to help the policymaker inch the odds upward - not by distorting their bottom line when required to make a predictive judgment, or by cheerleading, but by pointing to opportunities as well as obstacles. Indeed, on politically sensitive issues, analysts would be well advised to utilize a matrix that first lists and then assesses both the promising and discouraging signs they, as objective observers, see for... policy goals.... [P]roperly executed opportunity analysis stresses information and possibilities rather than [explicit] predictions.[62]

Linchpin Analysis. Linchpin analysis is one way of showing intelligence managers and policy officials alike that all the bases have been touched. Linchpin analysis, a colorful term for structured forecasting, is an *anchoring* tool that seeks to reduce the hazard of self-inflicted intelligence error as well as policymaker misinterpretation. At a minimum, linchpin tradecraft promotes rigor through a series of predrafting checkpoints, outlined below. Analysts can also use it to organize and evaluate their text when addressing issues

---

of high uncertainty. Reviewing managers can use — and have used — linchpin standards to ensure that the argument in such assessments is sound and clear.[63]

Table 10: Steps in Linchpin Analysis

Source: Davis, *Analytic Tradecraft*

1. Identify the main uncertain factors or key variables judged likely to drive the outcome of the issue, forcing systematic attention to the range of and relationships among factors at play.
2. Determine the *linchpin* premises or working assumptions about the drivers. This encourages testing of the key subordinate judgments that hold the estimative conclusion together.
3. Marshal findings and reasoning in defense of the linchpins, as the premises that warrant the conclusion are subject to debate as well as error.
4. Address the circumstances under which unexpected developments could occur. What *indicators* or patterns of development could emerge to signal that the linchpins were unreliable? And what *triggers* or dramatic internal and external events could reverse the expected momentum?

Analogy. Analogies depend on the real or presumed similarities between two things. For example, analysts might reason that because two aircraft have many features in common, they may have been designed to perform similar missions. The strength of any such analogy depends upon the strength of the connection between a given condition and a specified result. In addition, the analyst must consider the characteristics that are dissimilar between the phenomena under study. The dissimilarities may be so great that they render the few similarities irrelevant.

> One of the most widely used tools in intelligence analysis is the analogy. Analogies serve as the basis for most hypotheses, and rightly or wrongly, underlie many generalizations about what the other side will do and how they will go about doing it.[64]

Thus, drawing well-considered generalizations is the key to using analogy effectively. When postulating human behavior, the analyst may effectively use analogy by applying it to a specific person acting in a situation similar to one in which his actions are well documented: an election campaign or a treaty negotiation, for example. However, an assumption that a different individual running for the same office or negotiating a similar treaty would behave the same way as his predecessor may be erroneous. The key condition in this analogy is the personality of the individual, not the similar situations. This principle of appropriate comparison applies equally to government and business intelligence analysis.

---

[63] Davis, *Analytic Tradecraft*, 8-9.
[64] Clauser and Weir, 246-248.

> Analogies are used in many different kinds of intelligence analyses from military and political to industrial intelligence. For example, major U.S. auto makers purchase their competitors' models as soon as they appear in the showrooms. The new cars are taken to laboratories where they are completely and methodically disassembled. Reasoning by analogy, that is, assuming that it would cost one producer the same amount to produce or purchase the same components used by another, the major auto producers can estimate their competitors' per-unit production costs, any cost-saving measures taken, and how much profit is likely to be earned by the sale of a single unit.[65]

Customer Focus

As with the previous stages of the intelligence process, effective analysis depends upon a good working relationship between the intelligence customer and producer. A significant difference exists between the public and private sectors with regard to this customer-producer relationship. Government analysts typically benefit from close interaction with policymakers by virtue of their well understood institutional position. The same is not often true in the business world, where the intelligence analyst's role is not yet well institutionalized.

The government intelligence analyst is generally considered a legitimate and necessary policymaking resource, and even fairly junior employees may be accepted as national experts by virtue of the knowledge and analytic talent they offer to high level customers. Conversely, in the private sector, the intelligence analyst's corporate rank is generally orders of magnitude lower than that of a company vice-president or CEO. The individual analyst may have little access to the ultimate customer, and the intelligence service as a whole may receive little favor from a senior echelon that makes little distinction between so-called intelligence and the myriad of other decisionmaking inputs. When private sector practitioners apply validated methods of analysis geared to meet specific customer needs, they can win the same kind of customer appreciation and support as that enjoyed by government practitioners.

Statistical Tools

Additional decisionmaking tools derived from parametric or non-parametric statistical techniques, such as Bayesian analysis, are sometime used in intelligence. An exploration of them is beyond the scope of this study. Many of the statistically oriented tools continue to rely fundamentally on human judgment to assign values to variables, so that close attention to the types of reasoning and methods of analysis presented herein remain the fundamental analytical precondition to their use.[66]

---

[65] Clauser and Weir, 248-250.

[66] Editor's note: A former JMIC faculty member, Douglas E. Hunter, explores the intelligence applications of Bayesian Analysis in *Political/Military Applications of Bayesian Analysis: Methodological Issues* (Boulder, CO: Westview, 1984).

Analytic Mindset

Customer needs and collected information and data are not the only factors that influence the analytic process; the analyst brings his or her own unique thought patterns as well. This personal approach to problem-solving is "the distillation of the intelligence analyst's cumulative factual and conceptual knowledge into a framework for making estimative judgments on a complex subject."[67] Mindset helps intelligence analysts to put a situation into context, providing a frame of reference for examining the subject. Analysis could not take place if thinking were not bounded by such constructs. However, mindset can also lead analysts to apply certain viewpoints inappropriately or exclusively while neglecting other potentially enlightening perspectives on an issue. While no one can truly step outside his or her own mindset, becoming aware of potential analytic pitfalls can enable intelligence analysts to maximize the positive effects of mindset while minimizing the negatives.[68] Analysts can use the accompanying list of analytical pitfalls to determine which, if any, they may be applying in their work, and whether the relevant ones are accounted for in their analytic tasks.

Categories of Misperception and Bias[69]

Evoked-Set Reasoning: That information and concern which dominates one's thinking based on prior experience. One tends to uncritically relate new information to past or current dominant concerns.

Prematurely Formed Views: These spring from a desire for simplicity and stability, and lead to premature closure in the consideration of a problem.

Presumption that Support for One Hypothesis Disconfirms Others: Evidence that is consistent with one's preexisting beliefs is allowed to disconfirm other views. Rapid closure in the consideration of an issue is a problem.

Inappropriate Analogies: Perception that an event is analogous to past events, based on inadequate consideration of concepts or facts, or irrelevant criteria. Bias of "Representativeness."

Superficial Lessons From History: Uncritical analysis of concepts or events, superficial causality, over-generalization of obvious factors, inappropriate extrapolation from past success or failure.

Presumption of Unitary Action by Organizations: Perception that behavior of others is more planned, centralized, and coordinated than it really is. Dismisses accident and chaos. Ignores misperceptions of others. Fundamental attribution error, possibly caused by cultural bias.

---

[67] Jack Davis, "Combatting Mindset," *Studies in Intelligenc*e 35, no. 4 (Winter 1991): 13-18.
[68] Davis, "Combatting Mindset," 13-15.
[69] Excerpted from Dearth, "The Politics of Intelligence," 106-107.

Organizational Parochialism: Selective focus or rigid adherence to prior judgments based on organizational norms or loyalties. Can result from functional specialization. Group-think or stereotypical thinking.

Excessive Secrecy (Compartmentation): Over-narrow reliance on selected evidence. Based on concern for operational security. Narrows consideration of alternative views. Can result from or cause organizational parochialism.

Ethnocentrism: Projection of one's own culture, ideological beliefs, doctrine, or expectations on others. Exaggeration of the causal significance of one's own action. Can lead to mirror-imaging and wishful thinking. Parochialism.

Lack of Empathy: Undeveloped capacity to understand others' perception of their world, their conception of their role in that world, and their definition of their interests. Difference in cognitive contexts.

Mirror-Imaging: Perceiving others as one perceives oneself. Basis is ethnocentrism. Facilitated by closed systems and parochialism.

Ignorance: Lack of knowledge. Can result from prior-limited priorities or lack of curiosity, perhaps based on ethnocentrism, parochialism, denial of reality, rational-actor hypothesis (see next entry).

Rational-Actor Hypothesis: Assumption that others will act in a "rational" manner, based on one's own rational reference. Results from ethnocentrism, mirror-imaging, or ignorance.

Denial of Rationality: Attribution of irrationality to others who are perceived to act outside the bounds of one's own standards of behavior or decisionmaking. Opposite of rational-actor hypothesis. Can result from ignorance, mirror-imaging, parochialism, or ethnocentrism.

Proportionality Bias: Expectation that the adversary will expend efforts proportionate to the ends he seeks. Inference about the intentions of others from costs and consequences of actions they initiate.

Willful Disregard of New Evidence: Rejection of information that conflicts with already-held beliefs. Results from prior policy commitments, and/or excessive pursuit of consistency.

Image and Self-Image: Perception of what has been, is, will be, or should be (image as subset of belief system). Both inward-directed (self-image) and outward-directed (image). Both often influenced by self-absorption and ethnocentrism.

Defensive Avoidance: Refusal to perceive and understand extremely threatening stimuli. Need to avoid painful choices. Leads to wishful thinking.

Overconfidence in Subjective Estimates: Optimistic bias in assessment. Can result from premature or rapid closure of consideration, or ignorance.

Wishful Thinking (Pollyanna Complex): Hyper-credulity. Excessive optimism born of smugness and overconfidence.

Best-Case Analysis: Optimistic assessment based on cognitive predisposition and general beliefs of how others are likely to behave, or in support of personal or organizational interests or policy preferences.

Conservatism in Probability Estimation: In a desire to avoid risk, tendency to avoid estimating extremely high or extremely low probabilities. Routine thinking. Inclination to judge new phenomena in light of past experience, to miss essentially novel situational elements, or failure to reexamine established tenets. Tendency to seek confirmation of prior-held beliefs.

Worst-Case Analysis (Cassandra Complex): Excessive skepticism. Reflects pessimism and extreme caution, based on predilection (cognitive predisposition), adverse past experience, or on support of personal or organizational interests or policy preferences.

Because the biases and misperceptions outlined above can influence analysis, they may also affect the resultant analytic products. As explained in the following Part, analysis does not cease when intelligence production begins; indeed, the two are interdependent. The foregoing overview of analytic pitfalls should caution intelligence managers and analysts that intelligence products should remain as free as possible from such errors of omission and commission, yet still be tailored to the specific needs of customers. Consistently reminding intelligence producers of the dangers and benefits of mindset may help them avoid errors and polish their analytic skills. In addition, managers may conduct post-production evaluation of intelligence products, using the biases and misperceptions listed above to identify strengths and weaknesses in individual analysts' work, and to counsel them accordingly.

PART VI
PRODUCTION

Creating Intelligence

The previously-described steps of the intelligence process are necessary precursors to production, but it is only in this final step that functionality of the whole process is achieved. *Production* results in the creation of intelligence, that is, value-added actionable information tailored to a specific customer. In practical terms, production refers to the creation, in any medium, of either interim or *finished* briefings or reports for other analysts, or for decisionmakers or policy officials. As with elements of analysis developed in Part V, production principles described and explained here may apply to both government and private sector intelligence operations.

In government parlance, the term "finished" intelligence is reserved for products issued by analysts responsible for synthesizing all available sources of intelligence, resulting in a comprehensive assessment of an issue or situation, for use by senior analysts or decisionmakers. Creating finished intelligence for national and military customers is the role of CIA and DIA analysts, respectively. Analysts within an intelligence sub-discipline may also speak of a "finished" product from their point of view, meaning that intelligence from a single source, such as SIGINT, was interpreted as fully as possible in light of all other available intelligence from that source, plus any relevant published intelligence from other sources, and open source information. Analysts within the single-source intelligence agencies consider any information or intelligence not issued by their own organization to be "collateral."

Similar designations for finished intelligence products may apply in the business world. Particularly in large corporations with multidisciplinary intelligence units, or in business intelligence consulting firms, some production personnel may specialize in the creation of intelligence from a single source, while others specialize in finished reporting. For example, there may be specialists in library and on-line research, "HUMINT" experts who conduct interviews and attend conferences and trade shows, or scientists who perform experiments on products or materials. The reports generated by such personnel may be considered finished intelligence by their intended customers within subdivisions of the larger company. The marketing, product development, or public relations department of a corporation may consume single-source intelligence products designed to meet their individual needs. Such a large corporation may also have an intelligence synthesis unit that merges the reports from the specialized units into finished intelligence for use in strategic planning by senior decisionmakers. Similarly, in the intelligence consulting firm, each of the specialized production units may contribute their reports to a centralized finished intelligence unit which generates a synthesized product for the client.

Emphasizing the Customer's Bottom Line

The intelligence report or presentation must focus on the *results* of the analysis and make evident their significance through sound arguments geared to the customer's interests. In short, intelligence producers must BLUF their way through the presentation — that is, they must keep the "Bottom Line Up Front." This axiom applies not only to written expression, but also to oral briefings, or any other medium of expression used in the intelligence environment of government or business.

> It is often difficult for... intelligence [producers] to avoid the temptation to succumb to the Agatha Christie Syndrome. Like the great mystery writer, we want to keep our readers in suspense until we can deliver that "punch line." After we have worked hard on this analysis... we want the reader to know all the wonderful facts and analytical methods that have gone into our conclusions.... Most readers really will not care about all those bells and whistles that went into the analysis. ***They want the bottom line***, and that is what intelligence professionals are paid to deliver.[70]

Knowing the customer enables the producer to generate intelligence that highlights the bottom line. Some customers are "big picture" thinkers, seeking a general overview of the issue, and guidance on the implications for their own position and responsibilities. An appropriate intelligence product for such a customer will be clear, concise, conclusive, and free of jargon or distracting detail.[71] Conversely, some customers are detail-oriented, seeing themselves as the ultimate expert on the subject area. This type of customer needs highly detailed and specialized intelligence to supplement and amplify known information. The broad-brush approach to intelligence will not only miss the mark with this customer, but may actually be perceived as an insult, lessening the chances that future products by the offending producer will be accepted or used.[72] Producers should therefore tailor both the content and delivery of the intelligence to the customer. The following section provides guidelines for creating intelligence products that meet customer needs.[73]

Anatomy of an Intelligence Product

Whether it is produced within the government, or in the business setting, the basic nature of the intelligence product remains the same. The analyst creates a product to document ongoing research, give the customer an update on a current issue or situation, or

[72] Davis, *Analytic Tradecraft*, 7.

[73] The Central Intelligence Agency has published an unclassified collection of essays on techniques for producing finished national security intelligence. The purpose of the collection is to document best practices, and to reach out to academia and the public. Its title emphasizes the instrumentality of analysis to production. See Central Intelligence Agency, *A Compendium of Analytic Tradecraft Notes*, (Washington, DC, Directorate of Intelligence: February 1997).

provide an estimate of expected target activity. In general terms, the product's function is to cover one or more subject areas, or to be used by the customer for a particular application. Along with these aspects, additional dimensions of the intelligence product are summarized in the table below. They are more fully described in the following paragraphs.

Table 11: Dimensions of an Intelligence Product

Source: Author

Dimension Category	Dimension	Examples
Content	Subject	Biographical, economic, geographic, military, political, science and technology, sociology, transportation and communications
	Intended Use	Research, current, estimative, operational, science and technology, warning
Features	Timeliness	Short-/long-term, opportune, routine/priority
	Periodicity	Ad hoc/scheduled; analyst/customer-initiated
	Scope	Narrow/broad; detailed/summary; basic/exhaustive
Packaging	Medium	Hard/softcopy, written/oral, video
	Format	Formal/informal, textual/graphical
Customer	Relationship to producer	Intended/incidental recipient; internal/external; novice/expert
	Distribution method	Internal/external; direct/indirect; focused/broad

Content

Determination of product content is done in close cooperation with the customer, sometimes at the initiative of one or the other, often in a cycle of give-and-take of ideas. Formal intelligence requirements, agreed upon by both producer and customer in advance, do drive the production process, but the converse is also true. The intelligence unit's own self-concept and procedures influence its choice of which topics to cover, and which aspects to emphasize. As a result, the customer comes to expect a certain type of product from that unit, and adjusts requirement statements accordingly. In addition, the intelligence process may bring to light aspects of the target that neither the producer nor customer anticipated. When the parties involved have a close working relationship, either

one may receive inspiration from interim products, and take the lead in pursuing new ways to exploit the target.[74]

Often, this dialogue centers around the pursuit of new sources associated with known lucrative sources. Examples from government include HUMINT targeting of persons identified in SIGINT as having access to foreign leaders, and SIGINT targeting of communications equipment revealed in IMINT of a foreign military installation. Parallel business examples might include intelligence personnel following leads to new sources revealed in original research or a published report: A pharmaceutical industry analyst who reads a business intelligence report about current breast cancer treatments may then investigate how to access human and documentary sources mentioned in the report, for further information on new drug therapy options for the disease.

The basic orientation of the intelligence product toward a particular subject or application is also determined by the producer-customer relationship. Frequently, the intelligence service will organize the production process and its output to mirror the customer organization. Government production by the single-source intelligence agencies is largely organized geographically or topically, to meet the needs of all-source country, region, or topic analysts in the finished-intelligence producing agencies, such as DIA or the National Counterintelligence Center. In the private sector, some intelligence consultant firms are specializing in one subject area, and gearing all production to one customer set, such as the petroleum industry.

In terms of intended use by the customer, both business and government producers may generate intelligence to be applied in the current, estimative, operational, research, science and technology, or warning context. Serendipity plays a role here, because the collected and analyzed information may meet any or all of these criteria. A good example is warning intelligence. Military and political analysts are always alert for target indications that an emergency, such as outbreak of war, or a political coup, is imminent. Standing procedures dictate that routine operations switch to warning mode in this case, so that time-sensitive intelligence on the situation can be issued to all relevant customers. Business intelligence analysts may also find themselves in the warning role unexpectedly, when they make discoveries that have significant time-sensitive implications for customer decisions and actions.

Features

Three key features of the intelligence product are timeliness, scope, and periodicity. Timeliness includes not only the amount of time required to deliver the product, but also the usefulness of the product to the customer at a given moment. Scope involves the level of detail or comprehensiveness of the material contained in the product. Periodicity describes the schedule of product initiation and generation.

---

[74] Turner, 314-320.

In intelligence production, the adage "timing is everything" is particularly apt. When a customer requests specific support, and when actionable information is discovered through collection and analysis, the resultant intelligence product is irrelevant unless the customer receives it in time to take action — by adapting to or influencing the target entity. Timeliness therefore encompasses the short-term or long-term duration of the production process, and the degree to which the intelligence itself proves opportune for the customer. In addition, the relative priority of the intelligence contained in the product affects the timeliness calculus. For example, a business intelligence analyst conducting research for a consumer electronics corporation may produce short-term routine reports as new information becomes available. A long-term routine summary report may be the final output from this project. However, a short-term priority report may result at any time, if time-sensitive information on competitor capabilities or intentions comes to light.

The scope of an intelligence product describes both the amount of material it contains and the depth of coverage it provides on the topic. Its focus may be narrow or broad, and the content may be detailed or in summary form. The level of coverage may be basic or exhaustive. All of these aspects are determined by the customer's needs, and by the amount and extent of the source material available.

> The amount of detail distributed will depend on the circumstances and the requirements of the user. Time constraints often will determine how much detail is given. There may be such a wealth of detail on a particular subject that an analyst might spend a month or more making a detailed analysis, but the urgency of the need for the intelligence may be such as to make a brief survey, produced in two days, much more valuable. It is important to remember that many users of intelligence have neither the time nor the patience to read through a voluminous study, however excellent it may be, and would much prefer to have the essential elements of the analysis set down in a few succinct paragraphs. Some users, however, do require detail, and when that is the case it should be provided in a usable form.[75]

Periodicity is also linked to validated customer requirements. Intelligence products correspond to requirements that specify responsiveness criteria, thus production may occur on an *ad hoc* basis or on a schedule. Analysts may proactively generate products to meet known needs of specific customers, or they may respond to spontaneous customer requests for tailored intelligence. Furthermore, "analysts, as experts in their fields, are expected to initiate studies that address questions yet unformulated by [customers]."[76] By selecting from available source material, and determining when to issue an intelligence product, analysts have the potential to influence how their customers use intelligence to make policy decisions.[77] In the government, topic experts may become close advisors to National Intelligence Officers or directly to senior policymakers. In

[75] Mathams, 92.
[76] Turner, 319.
[77] Turner, 320.

the business world, a sharp intelligence analyst might be responsible for a dramatic change in a retail company's focus, by identifying emerging consumer trends and sensitizing management for the need to reorient the company. To effect this change, the company would become dependent on intelligence about competitors in the same industry. For example, an analyst's assessment of consumer interest in buying natural pet foods might stimulate requirements for further studies, and might lead a manufacturer to change its products to meet consumer demand, before another company captures that market.

Packaging

Government intelligence products are typically packaged as highly structured written and oral presentations, including electrical messages, hardcopy reports, and briefings.[78] Many organizations also generate video intelligence products, especially in the form of live daily "newscasts," or canned documentary presentations. However, the production landscape is being transformed by technology, and today, a wide range of options is available to both business and government. Modern telecommunications and software make possible a whole new world of intelligence production, in which all the players, including customers, are in constant interaction. The Department of Defense, for example, has devised the Joint Intelligence Virtual Architecture (JIVA) concept to accelerate and streamline the entire intelligence process. Under JIVA, intelligence personnel will use advanced communication and analysis tools to electronically collaborate with each other and their customers, resulting in improved timeliness and customization of Defense intelligence products.[79] Part of the JIVA concept is the use of on-line product modules that can stand alone as finished intelligence, or be synergistically combined with other modules for use by interim or ultimate customers.[80] Similar collaborative production techniques may be successful in large business intelligence units with geographically dispersed personnel and customers. However, the benefits offered by modern intelligence practices such as JIVA also present significant challenges, including the financial and political investment in new infrastructure, and the legal implications of the required cooperation between the government and technology firms.[81]

The format of the intelligence product, regardless of the medium used to convey it, affects how well it is received by the customer. Even in a multimedia presentation, the personal touch can make a positive difference. Therefore, the degree of formality, and the mix of textual and graphical material should match the customer's preferences. Some cus-

tomers want formal briefings, while others enjoy conversational give and take; some want a scheduled meeting, others want the analyst to be available at any time for impromptu consultation. Often, verbally oriented customers request one-on-one exchanges during official travel in automobiles or in airplanes. Conversely, the visually oriented customer may prefer video clips, graphs, charts, and photographs, accompanied by brief amplifying text. Many customers prefer written analyses, often in the form of concise executive summaries or point papers; some will ask for an in-depth study after consuming the initial or periodic assessment. However, producers should be aware of the potential pitfalls of relying on the executive summary to reach key customers. If the product does not appeal to the executive's staff members who read it first, it may never reach the intended recipient.[82]

Customer

In addition to understanding the customer's intelligence requirements, the producer may benefit from an awareness of the relationship between the customer organization and the intelligence service itself. Status issues between the two parties may influence the tone of the intelligence product. Aspects of the producer-customer relationship include whether the recipient is the intended or incidental customer, whether the customer is internal or external to the intelligence service, and whether the parties differ in their level of subject matter knowledge.

The intelligence producer selects the product content and format to suit a specific individual or customer set. However, the producer should beware of selecting material or phraseology that is too esoteric or personal for a potential wide audience. Intelligence products are official publications that become official records for use by all authorized personnel within the producer and customer organizations. They should focus on the primary customer's needs, yet address the interests of other legitimate players. Sometimes, when the producer is struggling with how to meet the needs of both internal and external customers, the solution is to create two different types of products, one for each type of customer. Internal products contain details about the sources and methods used to generate the intelligence, while external products emphasize actionable target information. Similarly, the producer adjusts the product content and tone to the customer's level of expertise. For example, a SIGINT producer may issue a highly technical and detailed product for fellow SIGINT service members, but for intelligence producers in a different agency, a less technical but still producer-oriented product may be appropriate. Similarly, the business intelligence producer within a marketing department may generate a highly specialized report for the head of the department, but may issue an executive summary for the company president.

Selection of the distribution method for the product is also closely tied to the relationship between producer and customer. The ability to deliver specific types of products to internal and external customers depends upon available infrastructure and

---

[82] Loch K. Johnson, *America's Secret Power, The CIA in a Democratic Society,* (New York: Oxford University Press, 1989): 98.

resources (telecommunications lines, transportation, media equipment). Politics affect whether intelligence can be delivered by the individual analyst directly to the customer, or only through a chain of command. Finally, the number of designated recipients is often determined by the sensitivity of the intelligence issue covered in the product. If the intelligence is highly sensitive, such as a report on threats to the president's life, then only the few involved persons (the president and a few key security personnel) will receive the report. A routine report may be broadly distributed to a large customer set. Thus, the choice of distribution method is more a marketing decision than a mechanical exercise.[83] Successful delivery of a truly useful intelligence product to a receptive customer is the result of communication and cooperation among all the players.

Customer Feedback and Production Evaluation

The production phase of the intelligence process does not end with delivering the product to the customer. Rather, it continues in the same manner in which it began: with dialogue between producer and customer.

> If the product is really to be useful for policy-making and command, dissemination involves feedback, which is part of the marketing function.... Ideally, the "marketer" who delivers the product is the same individual who accepts and helps to refine the initial requirement.[84]

Intelligence producers need feedback from end-users. If producers do not learn what is useful and not useful to customers, they cannot create genuine intelligence. Internal review procedures that focus on the format and style of intelligence products are not sufficient for producers to judge their performance; they must hear from customers on the intelligence value of their work. Then producers can modify their practices to further develop those activities that served the customer well, and improve or eliminate those that did not.

Feedback procedures between producers and customers should include key questions, such as: Is the product usable? Is it timely? Was it in fact used? Did the product meet expectations? If not, why not? What next? The answers to these questions will lead to refined production, greater use of intelligence by decisionmakers, and further feedback sessions. Thus, production of intelligence actually generates more requirements in this iterative process.[85] Producers and managers may use the framework developed by Brei and summarized below as an initial checklist for evaluating their own work, and as a basis for formal customer surveys to obtain constructive feedback.

Producers also need performance feedback from their own managers. Useful aspects of such an internal evaluation may include whether the output met the conditions set down by customers and producers in formal intelligence requirements, whether the intel-

---

[83] Johnson, 97.
[84] Dearth, "National Intelligence," 20.
[85] Dearth, "National Intelligence," 20.

ligence was indeed used by customers, and whether the product resulted from a high standard of analytic quality.[86] To establish a formal internal review process for monitoring the quality of analysis in intelligence products, managers could select experienced analysts to serve on a rotating basis as "mindset coaches" — reviewing assessments for issues of mindset, uncertainty, and policy utility, or consider pairing with another production division to swap personnel for this activity. As a rule, the less the critical reader knows about the substance of the paper the more he or she will concentrate on the quality of the argumentation. A reward for the best "mindset coaches" would be to make them branch chiefs.[87]

Table 12: A Framework for Intelligence Product Evaluation and Customer Feedback

Source: adapted from Brei

Accuracy: Were all sources and data free of technical error, misperception, and hostile efforts to mislead?

Objectivity: Were all judgments free of deliberate distortions and manipulations due to self-interest?

Usability: Was all production issued in a form that facilitated ready comprehension and immediate application? Were products compatible with the customer's capabilities for receiving, manipulating, protecting, and storing the product?

Relevance: Was information selected and organized for its applicability to a customer's requirements, with potential consequences and significance of the information made explicit to the customer's circumstances?

Readiness: Are intelligence systems responsive to the existing and contingent intelligence requirements of customers at all levels of command?

Timeliness: Was intelligence delivered while the content was still actionable under the customer's circumstances?

Management's role extends beyond fostering quality production, to bearing responsibility for organizing and administering the complete intelligence process. Managers make key decisions that mirror the intelligence process and make production possible. In conjunction with customers, managers determine what customer set the intelligence unit will serve; what sources it will exploit; what types of intelligence it will produce; and what methods of collection, processing, analysis, production, customer feedback, and self-evaluation it will use. The following Part of this primer explores best practices in managing the intelligence process.

[87] Davis, "Mindset," 17.

PART VII
MANAGING THE INTELLIGENCE PROCESS

The Role of Management

> Another discipline integral to the intelligence profession — but worthy of special consideration in this context — is that of management. The effective administration and direction of intelligence activities can be regarded as the epitome of intelligence professionalism. Just as an untutored civilian cannot be expected competently to command [a military unit], so an untrained or inexperienced layperson cannot be expected effectively to direct [an intelligence operation]. But mastery of professional intelligence skills does not, in itself, ensure that a person is able to direct intelligence functions competently; expertise in administrative techniques and behavioral skills is also essential to managerial effectiveness. Some facility in these areas can be acquired through experience, but a professional level of competence requires familiarity with the principles and theories of management, and leadership.[88]

Moreover, supervisors and managers have a particular responsibility for ensuring the professional development of their subordinates. When all the members of the intelligence unit are competent, then the effectiveness of the group increases. Enabling subordinates also frees managers to thoroughly plan and administer the intelligence operation, instead of redoing the work of production personnel. Meanwhile, managers may continue to broaden their own knowledge of the intelligence process and its customer-service mission.[89]

Organizing the Intelligence Service

In the national Intelligence Community, federal laws form the basis for a centrally coordinated but functionally organized system. The Director of Central Intelligence (DCI) leads the community with the aid of the National Intelligence Council (NIC). Members of the NIC come from all the intelligence agencies plus academia and the private sector. The

[88] George Allen, "The Professionalization of Intelligence," in Dearth and Goodden, 1995, 37. Informed debate on the realities of analysts' and managers' intelligence responsibilities toward customers is ongoing in the *International Journal of Intelligence and CounterIntelligence.* Examples of this literature are: Michael A. Turner, "Setting Analytical Priorities in U.S. Intelligence," 9, no. 3 (Fall 1996): 313-327; H. Bradford Westerfield, "Inside Ivory Bunkers: CIA Analysts Resist Managers' "Pandering" Part I, 9, no. 4 (Winter 1996/97): 407-424; and H. Bradford Westerfield, "Inside Ivory Bunkers: CIA Analysts Resist Managers' "Pandering" Part II, 10, no. 1 (Spring 1997): 19-54.

[89] Russell G. Swenson, *An Office Manager's Guide to Intelligence Readiness,* Occasional Paper Number Three (Washington, DC: JMIC, December 1996), 3-5.

NIC manages the national Intelligence Needs Process and supervises the production of National Intelligence Estimates for senior policymakers. Other senior bodies advise or assist the DCI in matters of policy, resource management, performance review, coordination of elements, customer relations, and intra-community relations.[90] Four topical intelligence centers staffed by multiple agencies coordinate intelligence production for policymakers in the key areas of Counterterrorism, Counterintelligence, Counternarcotics, and Nonproliferation.[91] Crisis situations may spark the formation of a temporary special task force, integrating intelligence functions that are usually separate. Although the national Intelligence Community is centrally coordinated, each member organization develops some self-determined policies and procedures, and engages in competitive analysis with respect to the other organizations.

The unifying principle across government intelligence missions is the basic charter to monitor and manage threats to national interests and to the intelligence service itself. In both the national Intelligence Community and the business community, managers may make a distinction between self-protective intelligence activities and competitive intelligence activities. Self-protection involves gathering and analyzing data about threats to public, personal, or multinational mission members' security, whereas competitive activities involve gathering and analyzing data about adversary organizations or countries. In business, the two functions are sometimes undertaken by entirely different companies or groups within the same company.[92] Government subordinates both functions within the intelligence infrastructure.

Table 13: Three Contexts for Government and Business Intelligence Tasks

Source: Author and Editor

Contexts:	**Individual**	**Corporate**	**Global**
Government Tasks:	Diplomatic Security/ Force Protection	Foreign Capabilities Assessment	Strategic Warning from Intelligence
Business Tasks:	Threat Analysis, Personal Risk Analysis	Business/Competitive Intelligence	Business Scenario Planning

Threat analysis in the business environment depends on the open exchange of information between companies, as it is widely recognized that no one benefits from other companies encountering unnecessary risk or danger to their personnel. On the other hand, at the corporate level, competitive business intelligence relies on the protection or discovery of important corporate data. In the public security environment, diplomatic security and

[90] CIA, *Consumer's Guide*, 2-3.

[91] Davis, *Opportunity Analysis*, 8.

[92] Jonathan Tetzlaff, Area Director, Security Research and Analysis, Amoco Corporation, personal correspondence with editor, 24 October 1997.

force protection for a government's own citizens, and for personnel in multilateral operations, is in the best interests of all. Conversely, foreign capabilities assessment operates in the context of a zero-sum game among countries, with potential winners and losers of the tactical advantage.

When the very survival of a corporation or country is at stake vis-a-vis other players in their respective environments, a global or strategic model applies. At this level, strategic warning intelligence takes center stage in the government security setting, and its counterpart — strategic scenario planning — achieves value in the private sector. Scenario planning has been used advantageously by some companies. The Shell Oil Company, for example, used scenario planning to justify disinvestment in oil exploitation infrastructure prior to the worldwide fall in oil demand in the 1980s. The company rose from 14th to 2nd place among oil multinationals, as overinvested companies lost billions.[93] The alternative to taking global or strategic intelligence action is to allow threats to emerge and to bring company or government officials to the realm of crisis management. There, fundamental government or business interests are at stake, and the outcome is more likely to be left to the vagaries of impulse and chance than to the considered judgment and actions of corporate or government leaders.

Private sector intelligence services can consider which elements of the national intelligence model may apply in their own domain. Will the organization require central coordination of diverse elements as the national system does, or might the intelligence unit more closely resemble a single collector or producer agency with a simpler management structure? Will an advisory group mediate between intelligence producers and customers, and does the intelligence service require its own staff to coordinate operations? Will the service be organized functionally into collection and production elements, or perhaps topically? Is

---

[93] Robbie E. Davis-Floyd, "Storytelling Corporate Futures: The Shell Scenarios," *International Journal of Futures Studies* 1 (1995-1997), on-line at http://www.systems.org/HTML/journals.htm, accessed 3 December 1997. The purpose of scenario planning is to force business managers and executives to face future uncertainties squarely by elaborating and evaluating the likelihood and impact of alternative hypothetical business environments. Dissenters are valued, rather than avoided, and, as in government intelligence channels, information is proactively developed to champion and refute the various scenarios as "controllable" pathways to the future. Recent reviews of business scenario planning include Kathy Moyer, "Scenario Planning at British Airways — A Case Study," *Long Range Planning* 29, No. 2 (April 1996): 172-181; Francoise Hecht, "The Aha! Factor," *Director* 50, No. 12 (July 1997): 59; and Ian Smith, "Avoiding Future Shock," *Director* 50, No. 12 (July 1997): 56-59.

A seminal work on the analytical environment for strategic warning in government intelligence is Ephraim Kam, *Surprise Attack* (Cambridge, MA: Harvard University Press, 1988). Although Kam focuses on military attack scenarios, the arena for strategic warning in government intelligence work has expanded as international security concerns shift toward economic competition and away from military confrontation. The convergence of economics and security signals a need for benchmarking the intelligence process, and could presage an era of greater collaboration between cells of intelligence analysts and policymakers at the highest levels, not unlike the give and take that characterizes successful business scenario planning.

the intelligence service an independent organization with external customers, or does it operate within a parent organization? If the latter, does each department, such as Marketing, Planning, or Research require its own tailored intelligence support? Does the chief executive require a centralized intelligence service, by whatever name, to assist in corporate policy-making? Should the service develop contingency plans for providing time-sensitive support in a crisis situation? On a larger scale, should intelligence services within an industry pool their resources for mutual benefit in a crisis environment, or to proactively adapt to a changing environment, as does the national Intelligence Community? The answers to these questions may help private sector intelligence organizations determine how closely to pattern their structure after that of the national intelligence system.

Managing Analysis and Production

Intelligence managers in government and industry need to decide how to organize the production process just as they need to determine the structure of the intelligence service as a whole. Typical methods of assigning analysts are by target function, geographical region, technical subject, or policy issue. The intelligence service may task analysts to concentrate on one type of source information, or to merge all available sources to produce "finished" intelligence or estimates. Some industries will need analysts to specialize in certain technical subject areas or complex issues, while large corporations may assign intelligence analysts to each of several departments such as Research or Product Development. Small independent intelligence services may require personnel to perform all the functions of the intelligence process from needs assessment to production and performance evaluation. In that case, analysts might be assigned to a particular customer account rather than a specific topic area. Part VIII of this primer presents findings on the attributes of intelligence analysts that may prove useful in determining how to allocate human resources in the intelligence production process.

> Some characterizations of the analytic mission...seem to emphasize serving the policymaking process as an abstraction: to tell it like it is, to level the playing field, to keep the policymakers honest, to be right on the record.... But excessive adherence to these attributes can cause overproduction of assessments that feature what analysts think policy officials should want to know, and underproduction of assessments featuring what officials think they need from...analytic specialists.... To provide the requisite benefits for policymakers, the analytic assessments of the intelligence production unit have to deliver a high order of understanding and insight that can support sound decisionmaking. One should avoid a definition of effective analysis that emphasizes accurate prediction...or one that centers on whether or not a policy worked.[94]

> Furthermore, managers can take the initiative in transforming intelligence into a proactive service. Managers who are isolated from the intelligence customer tend to monitor the quantity of reports produced and level of polish in intelligence products, but not the utility of the intelligence itself.[95]

---

[94] Davis, *Opportunity Analysis*, 2-3.
[95] Davis, *Opportunity Analysis*, 10.

> But policy officials will seek information and judgment from the source that provides it at the lowest personal cost, including the mass media, no matter how much money the intelligence organization is spending to fund analysis on their behalf. Thus, managers need to learn to ask for and accept opportunity analysis included in intelligence products, not remove it as inappropriate during the review process. One way to ensure that analysts produce truly useful intelligence is for managers to take an inventory, say twice per year, of the specific professional interests of their key [customers]. Policy officials are more comfortable thinking in terms of outputs than of inputs. Thus, the inventory should be couched in terms of the policymakers' objectives — their hopes and fears — and not in terms of their "intelligence priorities."... The intelligence manager should then take responsibility for converting the inventory into signals for the restructuring of collection, research, and analytic production.[96]

Evaluating the Intelligence Process

Beyond organizing and monitoring intelligence production, an additional management responsibility is to evaluate the intelligence service's overall mission performance. From the manager's perspective, intelligence products are not the only output from the intelligence process; therefore, products are not the only focus of rigorous self-evaluation. In the course of its operations, the intelligence unit expends and generates significant amounts of financial and political capital. Careful examination of this commodity flow may yield key insights into process improvement. Internal review procedures may thus include measures of how well the intelligence service and its components organize their work, use funds, allocate materiel and human resources, and coordinate with parent and customer organizations, all from the self-interested perspective of the intelligence service itself. To assist them in this effort, managers may evaluate the sub-processes and interim products of the Needs Definition, Collection, Processing, Analysis, and Production phases of the intelligence process in terms of Brei's Intelligence Values: Accuracy, Objectivity, Usability, Relevance, Readiness, and Timeliness.

Furthermore, to put a human face on intelligence process, conscientious managers may wish to include in their internal review a frank analysis of their own personnel management record. Perhaps a new definition of "customer" is in order for carrying out this aspect of intelligence evaluation. Seeing the members of the intelligence service as customers of management, and of each other, can enable managers to create a work culture in which each person's needs and talents are respected and incorporated into the organization's mission. By subscribing to the philosophy that a happy workforce is a productive workforce, managers may also achieve the organizational goal of satisfying external customer requirements. With this purpose in mind, principles for matching intelligence personnel to appropriate job assignments are discussed in the next Part of this primer.

PART VIII
PORTRAIT OF AN INTELLIGENCE ANALYST

The efficacy of the intelligence process described in the foregoing chapters depends upon personnel who are both able and willing to do the specialized work required. Through the findings of several government studies, this section presents the ideal characteristics of the central figure in value-added production — the intelligence analyst. According to these studies, the successful intelligence analyst brings to the discipline certain requisite knowledges and abilities, or has a high aptitude for acquiring them through specialized training; is able to perform the specific tasks associated with the job; and exhibits personality traits compatible with intelligence analysis work. This profile will remain valid in any setting modeled after the national security intelligence system.

The cognitive, performance and personality attributes of the intelligence analyst are explained below. Readers are encouraged to apply this information in accordance with their own particular circumstances. For example:

> Incumbents and individuals considering employment in intelligence analysis may deepen their self-awareness and assess their potential for success and satisfaction in this profession.
>
> Educators and recruiters may identify and prepare candidates for employment in intelligence analysis.
>
> Managers and supervisors may make enlightened decisions about selection, placement, tasking and evaluation of intelligence analysis personnel.

Cognitive Attributes

An individual's analytic skill results from a combination of innate qualities, acquired experience, and relevant education. Psychologists call these mental faculties cognitive attributes, and further divide them into two types: abilities (behavioral traits, being able to perform a task) and knowledges (learned information about a specific subject).[97] Whereas an individual's cognitive abilities are relatively fixed by the time he or she enters the job market, knowledges are situation-specific and can be acquired through training.[98]

According to a recent formal job analysis of selected intelligence analysts conducted by the NSA Office of Human Resources Services, important cognitive abilities for intelligence analysis include written expression, reading comprehension, inductive reasoning, deductive reasoning, pattern recognition, oral comprehension, and information

---

[97] Mark H. Haucke, Industrial Psychologist, NSA, interview with the author, 25 May 1995.
[98] Melissie C. Rumizen, Benchmarking Manager, NSA, interview with the author, 5 July 1996.

ordering.[99] Furthermore, both junior analysts and experienced analysts or supervisors agree that high levels of these abilities are necessary for performing the intelligence analysis job. The abilities are defined in the box below.

Cognitive Abilities Required of Intelligence Analysts[100]

Written Expression: The ability to use words and sentences in writing so others will understand. Involves knowledge of the meanings and distinctions among words, knowledge of grammar, and the ability to organize sentences and paragraphs.

Reading Comprehension: The ability to read and understand written sentences and paragraphs.

Inductive Reasoning: The ability to combine separate pieces of information, or specific answers to problems, to form general rules or conclusions. Involves the ability to think of possible reasons why things go together. Also includes coming up with a logical explanation for a series of events that seem unrelated.

Deductive Reasoning: The ability to apply general rules to specific problems to come up with a logical resolution. Involves deciding if the resolution makes sense.

Pattern Recognition: The ability to identify or detect a known pattern (a figure, word, or object) that is hidden in other material.

Oral Comprehension: The ability to listen and understand spoken words and sentences.

Information Ordering: The ability to follow a rule or set of rules in order to arrange things or actions in a meaningful order. The rule or set of rules to be used must already be given. The things or actions to be put in order can include numbers, letters, words, pictures, procedures, sentences, and mathematical or logical operations.

One set of junior analysts and another of supervisors were separately asked to judge the importance of each of these abilities in performing the intelligence analysis job (see Table 14). Junior analysts assign greater importance to two abilities (written expression and inductive reasoning), but significantly less importance to pattern recognition, than do their supervisors. These results have implications for staffing the intelligence analysis job in both the government and private sector. For example, if junior analysts place greater importance on written expression than their supervisors do, they may be frustrated to receive less training, tasking and recognition than needed for this aspect of their job. The discrepancies in the rankings among the five abilities judged most important by the two groups can be addressed individually by managers. However, the rankings provide some useful generalizations for identifying cognitive attributes applicable to any intelligence environment. In the case of the National Security Agency, the results presented here led

[99] Data were generated by Mark H. Haucke, Industrial Psychologist, using a Management Research Institute (MRI) survey instrument presented in *Ability and Knowledge Requirements* (Bethesda, MD: MRI, 1994).

[100] Adapted from MRI, *Ability and Knowledge Requirements.*

psychologists to design a job-relevant pre-employment aptitude exam for intelligence analysts.

Table 14: Comparative Ranking of Cognitive Abilities Thought to Be Required for Intelligence Analysis

(The lower the number on the 1 to 5 scale, the higher the perceived importance of the ability)

Source: Author and Haucke Study

Cognitive Ability	GROUP 1 (23 Junior Analysts - less than 7 years experience)	GROUP 2 (18 Supervisors — older generation; Ave. Years experience: 19)
Written Expression	1	3
Reading Comprehension	2	1
Inductive Reasoning	2	3
Deductive Reasoning	3	2
Pattern Recognition	3	1
Oral Comprehension	4	4
Information Ordering	5	4

Unlike the abilities categories, areas of knowledge for government intelligence specialists do not necessarily apply to their private sector counterparts. The formal job study of government intelligence analysts revealed that knowledge of military-related and technical subjects, not surprisingly, was prevalent among the individuals in the research group.[101] However, in either public or private sectors, managers can hire and train personnel to apply the requisite knowledges in a given job. A next logical step is to define the components of the intelligence analysis job, to be able to plan and assess individual job performance.

Performance Factors

Even as the analysis described above examined cognitive inputs to the job, a related performance review project, also at NSA, described intelligence analysts' output on the job. As part of this review, supervisors of intelligence analysts placed their subordinates' mission-essential job tasks into seven categories. Next, they evaluated the job performance of

[101] Data courtesy of Dr. Mark Haucke.

intelligence analysts according to those criteria. Researchers found a strong positive correlation between aptitude for intelligence analysis (as measured in the knowledges and abilities survey) and successful job performance (as rated by supervisors).[102] Following is a brief description of the seven intelligence analysis performance categories:[103]

Data Collection - Research and gather data from all available sources.

Data Monitoring - Review flow of scheduled incoming data.

Data Organizing - Organize, format, and maintain data for analysis and technical report generation.

Data Analysis - Analyze gathered data to identify patterns, relationships, or anomalies.

Data Interpretation/Communication - Assign meaning to analyzed data and communicate it to appropriate parties.

Computer Utilization - Use computer applications to assist in analysis.

Coordination - Coordinate with internal and external organizations.

This concise inventory echoes the intelligence process and illustrates the complexity of the intelligence analyst's job. It also serves as a blueprint for managers as they design intelligence organizations and individual personnel assignments. In particular, the analyst's job description should reflect these expected behaviors for purposes of recruitment, selection, placement, training, and performance evaluation. The intelligence organization should also be structured physically and logically to enable these functions to occur. Managers should consider how all these factors combine to determine the effectiveness of individual analysts, intelligence units, and even national agencies or private firms that produce and use intelligence.

Personality Traits

The third component of the intelligence analyst profile, personality traits, addresses the individual's preferences for behaving in certain ways under specific conditions. Adults tend to exhibit the same set of behavior preferences consistently in familiar situations. This behavior pattern may be identified as a personality type. One well-known instrument for identifying an individual's personality type is the Myers-Briggs Type Indicator (MBTI).[104] The following discussion of the intelligence analyst's personality is based upon MBTI research.

---

[102] Haucke interview, 13 June 1996.

[103] Standardized categories are presented in an MRI performance evaluation booklet, *Job Dimension Ratings* (Bethesda, MD: MRI, 1995).

[104] See Isabel Briggs Myers, *Introduction to Type*. (Palo Alto, CA: Consulting Psychologists Press, 1980), and Ronald D. Garst, *Intelligence Types: The Role of Personality in the Intelligence Profession*. 2d printing, (Washington, DC: Joint Military Intelligence College, August 1995).

> Personality types are associated with more or less predictable patterns of behavior — meaning that people of different personality types approach tasks differently and have different tastes, interests, likes and dislikes. For example, some people would rather work alone while others prefer to work with other people. Some enjoy working with concrete information, others with abstract information. Some decide on the basis of personal reasons, some on cold, hard logic. And finally, some people enjoy making decisions while others are reluctant to decide because of perceived information inadequacy.[105]

Research at the Joint Military Intelligence College (JMIC) demonstrates that intelligence professionals exhibit a pattern of personality traits that sets them apart from the U.S. population as a whole. In this regard, intelligence professionals are no different from many others, for every profession has its own distinct pattern of personality traits. A significant percentage (21 percent) of those who choose to pursue employment in national security intelligence tend to express the following behavior preferences: orientation to the inner world of ideas rather than the outer world of things and people, tendency to gather factual information through the senses rather than inspiration, proclivity to make decisions on the basis of logic rather than emotion, and an eagerness to seek closure proactively instead of leaving possibilities open. In contrast, researchers found that people who exhibit the opposite set of personality traits are almost non-existent among intelligence professionals. The chart below summarizes the terminology by which the MBTI describes personality traits. Note that the most frequently occurring type among the respondents to the JMIC survey exhibit the traits I, S, T and J.[106]

The JMIC data are based on a large sample of government intelligence students and practitioners. Persons engaged in the study or practice of other forms of intelligence, particularly in the private sector, should not expect their personality type to match the JMIC profile. However, intelligence practitioners who choose and successfully apply the intelligence methodology presented in this primer are likely to exhibit the same personality traits as those identified in government practitioners. Because people tend to be satisfied and productive in their work if their own personalities match the corresponding behaviors suitable to their jobs, this research tying personality traits to the intelligence profession can help individuals consider their general suitability for certain types of intelligence work.

---

[105] Garst, *Intelligence Types*, 1.
[106] Garst, *Intelligence Types*, 9.

Personality Aspects Measured by the MBTI[107]

Orientation to the world

E=Extraversion	**I=Introversion**
Orientation to the outer world of things and people, interacting with and affecting them	Orientation to the inner world of ideas and concepts, solitude and self-awareness

Perception: non-rational processes; awareness of things, people, events or ideas, selection of stimuli to attend to

S=Sensing	**N=Intuitive**
Gather information by physical sensation; oriented to facts, detail and the present	Gather information by inspiration, unconscious processes; oriented to possibilities, relationships, and the future

Judgment: ways of deciding, evaluating, choosing, selecting

T=Thinking	**F=Feeling**
Decide on basis of logic, impersonal objective criteria, cause and effect, laws and justice	Decide on basis of subjective, personal criteria and values, and how decisions affect other people and relationships.

Preference for Closure as manifested through behavior using S/N or T/F Functions

J=Judging	**P=Perceiving**
Want to have an issue or project completed so they can move on; work takes precedence over play; proactive	Leave decisions open to modify response in accordance with new information; use play to make work more enjoyable; reactive

[107] Compiled from Garst, *Intelligence Types*, 4-9.

PART IX
DEFENSIVE MEASURES FOR INTELLIGENCE

> [A]s information becomes more and more a factor of production, of tangible worth for its own sake, the value of the special knowledge that is the essence of intelligence will command a higher price in the global information age marketplace than will the generally available knowledge. Therein lies the most ancient and, at the same time, the most modern challenge to the future of intelligence — protecting it.
>
> *— Goodden, in Dearth and Goodden, 415.*

Beyond Intelligence Process: Protecting the Means and the Results

An intelligence organization's openness about its validated intelligence methods is of course tempered by self-defense considerations. Two arenas that are complementary to intelligence production, Operations Security (OPSEC) and Information Systems Security (INFOSEC), focus on how practitioners can avoid revealing proprietary or classified information. OPSEC measures protect the specific actions taken to produce intelligence, whereas INFOSEC protects from disclosure the intelligence information used in production, as well as the resulting intelligence products.

In government circles, standard procedures guide the implementation of OPSEC and INFOSEC measures. In the private sector, trial and error may predominate. Companies that emphasize methods for exploiting publicly available information about their competitors may show little regard for protecting themselves from being targeted by the same means they have employed to target others. Furthermore, the trend toward greater computerization of the workplace, including on-line information systems and networked services, makes both government and commercial organizations vulnerable to being exploited themselves.[108]

For example, the Boeing Corporation discovered in 1992 that amateur computer hackers had found their way into the company's computer network, and used stolen passwords to open pathways to proprietary information stored in other computers in industry, government, and education organizations.[109] Prosecuting this case cost Boeing, the FBI, and other law-enforcement authorities considerable time and money.[110] This case was trivial

---

[108] Keen insights into such vulnerabilities are presented in Ira Winkler, *Corporate Espionage: What It Is, Why It Is Happening in Your Company, What You Must Do about It,* (Rocklin, CA: Prima Publishing, 1997).

[109] Rhonda E. MacLean, Senior Manager, Boeing Computing and Communications Security, "The Boeing Hacker Incident," *DODSI Security Awareness Bulletin* Number 1-94 (Richmond, VA: Department of Defense Security Institute, August 1994), 19.

[110] MacLean, 20-21

compared to other well publicized security breaches in government and industry.[111] Yet, at the March 1996 international SCIP conference, of 72 presentations held during four days, only three specifically addressed counterintelligence or security.[112] One reason for this is that businesses may be reluctant to admit their own vulnerabilities in the presence of competitor firms. However, as a Boeing computer security officer has noted, corporations are beginning to realize that admitting flaws in information system defenses is the first step toward preventing future violations, and business and government should work together toward this goal.[113]

In light of the tendency to overlook OPSEC and INFOSEC implementation, the remainder of this section develops an instructional overview of the basic information that government and business personnel should know to protect their activities from unauthorized exploitation. Indeed, for the health of U.S. commerce and national security activities, everyone needs user-friendly information on how to protect proprietary information. Even the most sophisticated corporations have difficulty keeping up with the hazards of the information age; it was not until 1992 that Boeing mandated that all company computer users attend a security awareness briefing, and this was after the firm suffered a major breach of information security. Now Boeing sees "...the importance of information security to our company's long-term competitiveness..." and considers awareness activity as the cornerstone to a good security program.[114]

Operations Security

OPSEC is essential to the intelligence function in both the national security and business environments. OPSEC denies adversaries information about one's own operational capabilities and intentions by identifying, controlling, and protecting indicators associated with the planning and conduct of those operations and other related activities. An adversary is not necessarily a belligerent enemy: In OPSEC terms, an adversary is any entity that acts against one's own interest or actively opposes one's own goals.[115]

To protect an intelligence operation, practitioners can adopt an adversary's perspective. For example, factors at risk in one's own environment can be categorized into critical information, indicators, and vulnerabilities, described briefly below.

---

[111] Examples include those cited in Clifford Stoll, *The Cuckoo's Egg*, (New York: Pocket Books, 1990) and Winn Schwartau, *Information Warfare: Chaos on the Electronic Superhighway*, (New York: Thunder's Mouth Press, 1994).

[112] SCIP, *Conference Proceedings.* Annual International Conference & Exhibit, March 27-30, 1996, (Alexandria, VA: SCIP, March 1996).

[113] MacLean, 22.

[114] MacLean, 22.

[115] National Cryptologic School, Information Security Department, *Operations Security Fundamentals*, (Fort Meade, MD: 1994), 2.

Factors at Risk in Intelligence Operations	
Critical Information	Details of capabilities and operations directed against an adversary
Indicator	Detectable actions and publicly available information revealing critical information
Vulnerability	Conditions making exploitable information available to the adversary

Countermeasure options to prevent an adversary from exploiting these factors include: eliminating the indicators altogether, concealing indicator activities, disguising indicator activities, and staging deceptive (false) activities.[116]

The practice of OPSEC is so important to national security that a federal organization has been established as its advocate. As a result of the 1988 Presidential Directive on national operations security, the Interagency OPSEC Support Staff (IOSS) was formed, with the National Security Agency as its director. The core membership of the IOSS includes the Department of Defense, Department of Energy, Central Intelligence Agency, Federal Bureau of Investigation, and General Services Administration.[117] Other executive and national security bodies, including the military services, have representation on the National Operations Security Advisory Committee, which advises the Executive Branch on the practice of OPSEC.[118] The IOSS may be contacted for assistance at:

Interagency OPSEC Support Staff, 6411 Ivy Lane, Suite 400, Greenbelt, MD 20770-1405 Telephone (301) 982-2313/0323.

Information Systems Security

Information Systems Security (INFOSEC) refers to the protection of information that an organization uses and produces in the course of its operations. Today, this means protecting complex electronic networks. Government and business depend upon computerized systems for everything from banking, communications, and data processing to physical security and travel reservations. To the casual observer, INFOSEC may seem the domain of a few technical specialists, or the exclusive concern of the military or intelligence agencies. But INFOSEC is the responsibility of everyone who has ever used a telephone, computer, or automatic bank teller machine.[119]

---

[116] National Cryptologic School, 9.

[117] National Security Agency, Introduction.

[118] National Operations Security Advisory Committee, *National Operations Security Doctrine*, (Greenbelt, MD: Interagency OPSEC Support Staff, January 1993): unnumbered back of first and second physical pages from beginning.

[119] A basic reference on INFOSEC is the National Research Council book *Computers at Risk: Safe Computing in the Information Age*, (Washington, DC: National Academy Press, 1991).

> INFOSEC today [involves] significantly more than the traditional security offered by encryption. Network vulnerability to adversarial intercept, tampering, or destruction of data mandates INFOSEC solutions that ensure the authentication, integrity, and availability of classified and unclassified information created, stored, and processed on [information] systems. ... Such solutions must enable the interconnection of Command and Control, intelligence, and support systems and must allow for the commingling of critical information of different classification levels on a common transport backbone. INFOSEC solutions must be flexible, configurable, and result from a risk management scenario that balances the costs and availability of countermeasures against actual threats to, and vulnerabilities of, networks and systems. Finally, INFOSEC must accomplish all of this in an environment in which networks are neither owned nor controlled by [the government] and resources are severely constrained.[120]

Each intelligence organization and activity must tailor its INFOSEC measures to its particular technologies and operational practices, weighing the costs of such measures against their value in safeguarding the mission. A three-dimensional model of INFOSEC, illustrated below, may guide the intelligence service in implementing protective measures and assessing their adequacy. The first dimension addresses the need to understand the vulnerability of information as it passes through different stages of use. The second dimension includes the key characteristics of information that must be preserved for it to remain useful and secure. The third dimension covers the general categories of INFOSEC tools that the intelligence service may employ. Each element of the model is dependent on the others.[121] Together, these interlocking pieces make up a comprehensive INFOSEC strategy appropriate to the public or private sector.

Dimensions of INFOSEC[122]

Information States:	Transmission, Storage, Processing
Critical Information Characteristics:	Confidentiality, Integrity, Availability to Legitimate Users
Countermeasures:	Technology, Policy/Practice, Education

Role of the Federal Government

Federal agencies, including Intelligence Community members, play key roles in helping both government and businesses learn and practice INFOSEC. The two primary authorities for INFOSEC are the Department of Commerce and the Department of

[120] National Security Agency, Introduction, para. D.2.

[121] Lynn F. Fisher, "Defining the Threat to Information Systems," *DODSI Security Awareness Bulletin* 2-94, (August 1994), 4.

[122] Fisher.

Defense. Organizations within these departments provide INFOSEC services to their respective constituencies within the framework of national information policies established by the Executive Branch. The following overview begins with a summary of Executive Branch policy.

National Information Policy

> The vision of the National Information Infrastructure — or NII — is [as] a vast accessible network of networks that supports communications and information processing to create jobs, increase productivity, improve access to government services, and encourage community networking. The NII is also the wide array of information of all kinds within the networks, whether it is stored, processed, or communicated. Finally, it includes the people... who are today creating and using the NII.[123]

The federal government's role in the NII is to provide a sound legal and policy framework, in conjunction with state, local and Native American governments. Current initiatives include assuring universal service on the NII, thereby enabling open access to government information; protecting intellectual property rights; protecting the privacy of individual information; and stimulating the development of advanced information technologies, including security technologies.[124] The Office of Management and Budget's (OMB) national information security authority covers the development, promotion, implementation and evaluation of government policies and practices for information resource management.[125]

A multi-agency group, the national Information Infrastructure Task Force (IITF), coordinates the federal role in the NII through three committees: the Committee on Applications and Technology, the Telecommunications Policy Committee, and the Information Policy Committee. The OMB's Office of Information and Regulatory Affairs chairs the IITF's Information Policy Committee. As noted below, elements of the Commerce Department chair the other two IITF committees. In addition, the NII Security Issues Forum coordinates NII security activities throughout the IITF and the federal government.[126]

Commerce Department

The Commerce Department's Assistant Secretary for Communications and Information heads the National Telecommunications and Information Administration (NTIA).

---

[123] Sally Katzen, Administrator, Office of Information and Regulatory Affairs, U.S. Office of Management and Budget, Remarks prepared for delivery at the National Computer Security Conference, Baltimore, MD, 11 October 1994.

[124] Katzen.

[125] U.S. Congress, Office of Technology Assessment, *Information Security and Privacy in Network Environments* (Washington, DC: GPO, September 1994), 137.

[126] Katzen.

The NTIA's information security responsibilities include: serving as the principal executive adviser to the President on telecommunications and information policy; serving as the principal federal telecommunications research and engineering laboratory, through the Institute for Telecommunication Sciences in Boulder, Colorado; and providing grants to programs that promote the development and provision of advanced telecommunications technologies for the public. The NTIA chairs the IITF's Telecommunications Policy Committee.[127]

The Commerce Department's Technology Administration includes two components involved in information security, the Office of Technology Policy (OTP) and the National Institute for Standards and Technology (NIST).

> The primary role of the OTP is to offer assistance to private sector and government communities in advocating and pursuing policies that maximize the impact of technology on economic growth, and by exercising leadership to define the role of government in supporting U.S. industrial competitiveness in the post-cold war environment. ... NIST's primary mission is to promote U.S. economic growth by working with industry to develop and apply technology, measurements, and standards.[128]

NIST is the national authority for developing government-wide standards and guidelines for protecting unclassified but sensitive information, and for developing government-wide training programs.[129] NIST also chairs the IITF's Committee on Applications and Technology.[130] Finally, NIST maintains the Computer Security Resource Clearinghouse (CSRC) as a resource for anyone with an interest in computer security. It is available on-line 24 hours a day, seven days a week at no charge. The CSRC provides access to crisis response information on security-related threats, vulnerabilities, and solutions, and is a general index to computer security topics such as general risks, privacy, legal issues, viruses, assurance, policy, and training.[131]

Defense Department

The Secretary of Defense is the Executive Agent for National Security Telecommunications and Information Systems Security.[132] As a whole, Department of Defense (DoD) information and communications systems are termed the Defense Information Infrastructure (DII). Under the direction of the Secretary of Defense, three DoD agencies form the

[132] National Security Agency, Chapter 3, B.d.

core DII INFOSEC team: the Defense Intelligence Agency (DIA), the Defense Information Systems Agency (DISA), and the National Security Agency (NSA). Although notionally the DII is a dedicated system for proprietary and classified national defense information, in fact over 95 percent of its communications are carried on the public switched networks of the NII.[133] Thus, DoD expertise in information security doctrine and technology makes the organizations explained below key resources for other government organizations and for the private sector.

The Defense Intelligence Agency, as the central authority for military intelligence, provides INFOSEC threat analysis and support to the DII.[134] Another agency, DISA, is responsible for planning, developing, and supporting command, control, communications, and information systems that serve the needs of the National Command Authorities under all conditions of peace and war; it further ensures the interoperability of all DII systems and those national and/or international commercial systems that affect the DISA mission.[135] NSA acts as the National Manager for National Security Telecommunications and Information Systems Security in the name of the Secretary of Defense. In this capacity, NSA is the focal point for U.S. government cryptography and for the security of national security telecommunications and information systems.[136] NSA provides DISA with the tools, techniques, products, services, and security management structures to protect the DII, through its "V" Group, the customer service and engineering organization for information systems security.[137] Within NSA, the National Computer Security Center (NCSC) conducts technical evaluation of the protection capabilities of commercially produced and supported systems.[138] Through its Information Systems Security Research Joint Technology Office (ISSR-JTO), NSA coordinates with DISA and the DoD's Advanced Research Projects Agency on engineering INFOSEC technologies. The ISSR-JTO provides a first line of defense for defensive information warfare, and permits electronic commerce between DoD and its contractors. It also maintains research and technology interfaces with the military departments, national labs, universities, and industry.[139] NSA coordinates with the National Institute for Standards and Technology (NIST) in matters of common concern.[140] Together, DIA, DISA, and NSA operate the DoD Center for Information Systems Security.[141]

The Department of Defense's INFOSEC Program Management Office (IPMO) is a joint DoD/DISA/NSA organization charged with executing centrally managed INFOSEC functions within the DoD.[142] The IPMO provides operational protection and detection capability for the DII against information exploitation, manipulation, or destruction. It administers DoD-wide INFOSEC training and manages the DoD INFOSEC Technical Services Contract. The IPMO conducts vulnerability, threat, and operational analyses of the DII, provides security policy guidance and oversight to DISA programs, and certifies DISA and non-DISA systems that connect to the DII.[143] The IPMO also provides support to the Assistant Secretary of Defense for Command, Control, Communications, Computers, Intelligence, Surveillance and Reconnaissance (ASD/C4ISR).[144] Another DoD body, chaired by the ASD/C4ISR, also has a role in INFOSEC. Under the purview of the National Security Council, the National Security Telecommunications and Information Systems Security Committee (NSTISSC) advises Executive Branch agencies and Departments on the status of national security systems. Its two subcommittees focus on telecommunications security and information systems security, respectively. NSA provides the NSTISSC secretariat.[145]

In addition, the DoD Security Institute (DODSI) promotes security awareness and compliance with security procedures in DoD by offering training courses to security personnel in DoD and DoD-related industry, publishing security awareness bulletins, and disseminating information to security trainers on security and counterintelligence.[146]

INFOSEC for Everyone

The national authorities for INFOSEC described above evolved out of the need to protect the fundamental role of information in a democratic society and market economy. They help strike the balance between free exchange of information and privacy, and between free enterprise and regulation. Government-sponsored information policy and technology set the standards upon which nearly every facet of public and private life is based. Citizens receive basic services through government-created or -regulated information infrastructure, including automatic payroll deposit to employee bank accounts, cellular telephone service, electronic commerce via the Internet, air and rail traffic control, emergency medical services, and electrical power supply.

Such services contribute not only to the citizen's quality of life, but to the very functioning of the nation. Information is the lifeblood of society and the economy. Imagine the chaos that would reign if the government, the military, banks, businesses, schools, and hospitals could not communicate reliably. Life would come to a halt.

---

[142] IPMO, 14.
[143] DISA, "INFOSEC," 7.
[144] U.S. Department of Defense Security Institute (DODSI), *DODSI Security Awareness Bulletin* 2-94 (August 1994): 25.
[145] NSA, Chapter 3, B.a, B.b, and B.c.
[146] DODSI, front cover, 12, 18.

INFOSEC is designed to protect society from inadvertent or intentional harm to these key functions. The same free access to information that makes society flourish also makes it vulnerable to damage, attack or exploitation. For example, passive threats such as shoddy equipment, faulty software, or negligent personnel can disrupt service and destroy information. Hostile threats include thrill-seeking computer hackers and belligerent foreign adversaries who deliberately target sensitive government and public information networks with the aim of disrupting or destroying key operations, such as military projects or power grids.[147] Comparable scenarios within the business sector, to include information sabotage and deception actions against competitors, are at least plausible. Therefore, basic knowledge of INFOSEC may benefit citizens in all walks of life. Addresses and phone numbers for the INFOSEC agencies that can assist the public are listed at the end of this chapter.[148]

Government expertise in information technology and policy has made it the authority specifically on protecting intelligence operations. The private sector may also benefit from this expertise by applying INFOSEC measures in business intelligence. In brief, successful intelligence operations rely on secure transmission, storage, and processing of the information used. The information itself must be exchanged only among legitimate users, and it must retain its intended meaning and be available to users upon demand. Finally, intelligence information and products can be protected through technology (access control, encryption), through security policies and practices, and through educating the workforce, as with this document.

EPILOGUE

This primer has reviewed government intelligence production practices in building-block fashion. It has also explored the defensive measures comprising information security and operations security, which are integral to all the building blocks, and are equally applicable to private businesses and government organizations. Finally, the primer has drawn a cognitive, behavioral and personality profile of the central figure in intelligence production — the intelligence analyst. In the spirit of benchmarking, this document invites a reciprocal examination of best practices that may have been developed by private businesses, and of principles that may have been derived from other academic studies of intelligence-related processes.

Although this effort reflects a government initiative, in fact the government Intelligence Community may receive the greater share of rewards from benchmarking its own process. Potential benefits to the Community include an improved public image, increased self-awareness, more efficient recruitment through more informed self-selection by candidates for employment, as well as any resultant acquisition of specialized information from subject matter experts in the business and academic communities.

Primary advantages for the government's partners in the exchange of information on best practices could be greater understanding of how tax dollars are spent, and the opportunity to transfer an appreciation of government professional intelligence production, security, and staffing methods into academic curricula and business operations.

For all participants in benchmarking, releasing information is actually a way of controlling it, a way of depicting and fostering an accurate organizational image rather than allowing others to draw and disseminate erroneous characterizations. For the U.S. Intelligence Community in particular, any initiative in benchmarking the intelligence process fulfills a charge of the recently completed Report on the Community's Roles and Capabilities: to improve its performance through closer relationships with customers, including the private sector.

GLOSSARY

ASD/C4ISR	Assistant Secretary of Defense for Command, Control, Communications, Computers, Intelligence, Surveillance and Reconnaissance
BI	Business Intelligence
CIA	Central Intelligence Agency
CISS	Center for Information Systems Security
CSRC	Computer Security Resource Center
DCI	Director of Central Intelligence
DIA	Defense Intelligence Agency
DII	Defense Information Infrastructure
DISA	Defense Information Systems Agency
DoD	Department of Defense
DODSI	Department of Defense Security Institute
FISINT	Foreign Instrumentation and Signature Intelligence
GPO	U.S. Government Printing Office
HUMINT	Human Intelligence

ABOUT THE AUTHOR

Lisa Krizan has been a researcher with the Department of Defense since 1987. She received a master's degree from the Joint Military Intelligence College in 1996 and developed many of the ideas for this paper as part of her thesis on benchmaking the intelligence process. A second-generation intelligence scholar, she follows the example set by her father, 1972 Defense Intelligence College graduate Allen J. Montecino, Jr., Colonel, USAF (Ret).

BRINGING INTELLIGENCE ABOUT

Practitioners Reflect on Best Practices

May 2003

Russell G. Swenson, Editor

With a Foreword by
Mark M. Lowenthal
Assistant Director of Central Intelligence

The Joint Military Intelligence College supports and encourages research on intelligence that distills lessons and improves support to policy-level and operational consumers, and that familiarizes the public with aspects of the intelligence profession.

Bringing Intelligence About: Practitioners Reflect on Best Practitioners

The title chosen for this book carries two meanings. The more straightforward interpretation of "Bringing Intelligence About," and the principal one, refers to the book's coverage of wide-ranging sources and methods employed to add value to national security-related information—to create "intelligence." A second meaning, not unrelated to the first, refers to the responsible agility expected of U.S. intelligence professionals, to think and act in such a way as to navigate information collection and interpretation duties with a fix on society's shifting but consensual interpretation of the U.S. Constitution.

A prominent individual and ideal intelligence professional who lived both meanings of "Bringing Intelligence About" was the late Lieutenant General Vernon A. Walters. As an intelligence officer, defense attache, ambassador-at-large and ambassador to Germany, his combination of skills—notably his language skills—made him the epitome of a professional. Beyond intelligence service in the Departments of Defense and of State, General Walters presided as Deputy Director of Central Intelligence during the Watergate episode, where he stood on principle and at odds with political figures in the Nixon administration. His mastery of intelligence collection, analysis and politically attuned synthesis, the full story of which has not yet been told, make him a near-mythic figure for aspiring intelligence professionals.

Although the talents and assignments of General Walters were extraordinary, his demonstration that intelligence aptitudes and skills are fungible across Departments and Agencies is a powerful suggestion that those separate institutions can also operate together as a professional community.

The papers in this publication are based exclusively on sources available to the public and the views expressed are those of the respective authors, and do not necessarily reflect the official policy or position of the Department of Homeland Security, the Department of Defense or the U.S. Government.

This publication has been approved for unrestricted distribution by the Office of the Secretary of Defense (Public Affairs). Copies of this publication are available in limited quantities to U.S. Government officials, and to the public through the National Technical Information Service (www.ntis.gov), or the U.S. Government Printing Office (www.gpo.gov).

FOREWORD

There are two anecdotes from the world of entertainment that seem apt to introduce this book.

First: The great 19th-century Anglo-Irish actor Edmund Kean lay on his deathbed. A friend asked, "Is it hard, Edmund?"

"No," he replied. "Dying is easy. *Comedy* is hard."

Second: A Hollywood producer in the 1930s or 1940s was asked why a certain film succeeded at the box office but another did not. He replied, "If we knew the answer to that, we'd only make hits."

Similarly, the process of intelligence is easy; *good* intelligence is hard. And if we could figure out what made some intelligence "good" or "better" (which would require some further definition), then we would produce it more regularly.

We spend a lot of time in the Intelligence Community analyzing the various parts of the intelligence process and trying to define what makes some intelligence better than other intelligence. And yet, for all that intellectual effort, we still have not evolved a steady and reliable means of producing this "better" intelligence. We know when the process works and when it does not, but this knowledge does not turn into a formula for greater success.

Why is that? Are we unable to learn from our own successes and failures? Or does the process remain so intangible at core that it eludes us even when we have, on occasion, mastered it? My own view is that we have not yet (after more than 55 years) come up with a good picture in our minds—nor have we successfully enunciated—just what a professional intelligence analyst "looks like," and how we train and develop this analyst across his or her entire career—not just at the outset. Interestingly, we do know what the analyst's ethos is, but we remain fuzzy on the necessary professional underpinnings.

This volume helps us move down the long and difficult road of helping identify how to produce good or better intelligence—by which I mean intelligence that is of use to policymakers and is better than other intelligence by being so used. The authors have—across a range of areas of interest—identified some of the practices that work best to produce—or, more aptly, "to bring about"—good intelligence. Note that the preceding sentence said "some of the practices." Few books could expect to identify all of the practices that work and, as the authors of each chapter would undoubtedly concede, there will always be some variables and intangibles at work in intelligence: vagaries of time to perform collection and analysis; the quality of sources; the quality of the analysts; the nature and personality of the policymakers. Still, it is possible to identify the practices that work and the practices that have to be altered over time as conditions change.

I cannot help but think that if we were to take the various observations and recommendations of these chapters and shape them into a coherent program we would be well on our way to producing better intelligence on a more consistent basis. Of course, we would still face the issue of where that program should exist and how it should be imparted because, for all of the improvements we have made in training and developing analysts, we still do this in vertical, agency-dominated stovepipes. We have a variety of courses that seek to train (or inculcate) people into the broader Community aspects of intelligence, but training remains a series of isolated enterprises. Thus, even if we accept the many good ideas in this book, getting them to all of the people who might benefit from them remains typically problematic.

Finally, it is also important to understand that this book focuses on the issue of analysis. I am admittedly prejudiced in my views, but I believe that analysis is the main goal of any intelligence enterprise: putting informed judgments in front of policymakers to help them make decisions. This is not meant to demean clandestine activities in the field, or the designing and operation of collection systems, or any of the other necessary parts of the broader intelligence function. But, at the end of the day, the most consistent service intelligence provides is analysis, whether it is a one-line warning or a detailed estimate. The Infantry likes to call itself "the Queen of Battle." This is how I feel about analysis in the world of intelligence. This book helps analysis remain firmly placed on her throne.

ABOUT THE AUTHOR

Dr. Russell G. Swenson directs the Center for Strategic Intelligence Research at the Joint Military Intelligence College. His initial exposure to the world of intelligence was as an Air Force linguist in the mid-1960s. He holds undergraduate degrees from the University of Kansas, and graduate degrees in Geography from the University of Wisconsin-Milwaukee. At the JMIC since 1988, he has taught the course on strategic warning from intelligence, as well as thesis research and writing seminars. He also teaches a course on intelligence issues in Latin America. His research interests include the application of analytic methods and the comparative study of intelligence practices, especially in the Western Hemisphere.

INTRODUCTION

Russell G. Swenson
with David T. Moore and Lisa Krizan

This book is the product of studious self-reflection by *currently serving* intelligence professionals, as well as by those who are in a position, with recent experience and continuing contacts, to influence the development of succeeding generations of intelligence personnel. Contributors to this book represent eight of the fourteen organizations that make up the National Foreign Intelligence Community. A positive image of a community of professionals, engaged in public service, and concerned about continuous self-improvement through "best practices," emerges from these pages.

Practitioners anywhere in this Community are professional by any definition of the term. Their work requires extensive education and specialized training, and at their best, personnel exhibit highly innovative approaches to collection and analysis. Differences in focus among the principal Intelligence Community partners are sometimes sharp, but similarities in techniques do exist, particularly at the "working level." Community partners, such as the Central Intelligence Agency (CIA), Defense Intelligence Agency (DIA), the National Security Agency (NSA), and the State Department's Bureau of Intelligence and Research (INR), for example, share responsibilities for national security issues that allow individual collectors, analysts, issue managers and offices to work together on interagency task forces.

However, commonalities may decrease farther afield, for example between the agencies with a strategic focus and those involved in tactical or law-enforcement intelligence. Not the least of these differences is that, with its strategic focus, the Intelligence Community expects to be forward-looking, envisioning future developments and their repercussions, whereas law enforcement intelligence efforts have typically focused on exploiting pattern analysis to link together the extralegal behavior of individuals and organizations with clear and legally acceptable evidence. Some overlap of intelligence applications already occur, especially in the areas of crime and narcotics, where interagency task forces work from both ends of the problem—the predictive and the reactive—so that a facile claim of significant differences between law enforcement and national security intelligence may hold up to scrutiny only in terms of the scale of operations supported rather than professional intelligence techniques employed. [1] We may infer from these observations that the principles of intelligence collection and analysis addressed in this book will apply to intelligence creation in the broadly overlapping cultures of law enforcement and national security intelligence.

---

[1] Two works that document the evolution of criminal or law enforcement intelligence, both in the U.S. and internationally, are 1) *Intelligence 2000: Revising The Basic Elements: A Guide for Intelligence Professionals*, Marilyn Peterson, ed. (n.p.: Law Enforcement Intelligence Unit, California, and International Association of Law Enforcement Intelligence Analysts, 2000), and 2) Don McDowell, *Strategic Intelligence: A Handbook for Practitioners, Managers and Users* (Cooma, NSW, Australia: Istana Enterprises Pty, Ltd, 1998). These books provide evidence of a convergence, in both instructional and professional standards of practice, between law enforcement and national security intelligence.

The concept of a *Community* of professional intelligence collectors and analysts persists, despite the specialized character of much of their work. Further, the National Foreign Intelligence Community does not remain static, as shown by its recent (2001), formal incorporation of the U.S. Coast. The Coast Guard combines its new intelligence focus with its traditional broad responsibilities in law enforcement, in paramilitary operations, and in public safety. As a new, young member, and a bridge between national security and law enforcement spheres, the USCG is in position to help rejuvenate the community by exemplifying the ideal of sharing both information and assessments.

The U.S. Intelligence Community was subject during the 1990s to a congressionally mandated reduction in Intelligence Community personnel levels.[2] This reduction occurred despite numerous small wars and the continuation of international criminal activity during the decade. When dissenters, such as former Director of Central Intelligence James Woolsey, "talked about the proliferators, traffickers, terrorists, and rogue states as the serpents that came in the wake of the slain Soviet dragon, [they were] accused of 'creating threats' to justify an inflated intelligence budget."[3] Even government reports such as that of the United States Commission on National Security (commonly referred to as the Hart-Rudman Report), which warned of catastrophic attacks against the American homeland and a need for vigilance, were dismissed.[4]

Intelligence collectors and analysts have at times been subject to personnel retrenchment, a situation favoring current operations support, and leading to the neglect of individual and corporate succession planning—to capture and pass on institutional and target knowledge. Today, collection and analysis tradecraft remain neglected phenomena—the focus of very few self-studies.[5] Naturally, some literature known to "insiders" is not made available to the general public because of the admonition not to disclose "sources and

[2] John E. McLaughlin, CIA Deputy Director of Intelligence, notes that the reduction was 22 percent. See McLaughlin's "The Changing Nature of CIA Analysis in the Post-Soviet World," remarks as prepared for delivery at the Conference on CIA's Analysis of the Soviet Union, 1947-1991, 9-10 March 2001 (Princeton, NJ: Princeton University, 2001), URL: <http://www.cia.gov/cia/public_affairs/speeches/archives/2001/ddci_speech_03092001.html>, accessed 22 December 2002. Cited hereafter as McLaughlin.

[3] McLaughlin.

[4] U.S. Commission on National Security/21st Century, *New World Coming: American Security in the 21st Century*, The Phase I Report on the Emerging Global Security Environment for the First Quarter of the 21st Century, Supporting Research and Analysis (Washington, DC: GPO, 15 September 1999), 49.

[5] The few works that do address intelligence practices in informed detail have become classics, and are widely cited. They include Sherman Kent's *Strategic Intelligence For American World Policy* (Princeton, NJ: Princeton University Press, 1949); Roger Hilsman, *Strategic Intelligence and National Decisions* (Glencoe, IL: The Free Press, 1956); Washington Platt, *Strategic Intelligence Production: Basic Principles* (New York: Frederick A. Praeger, 1957); Bruce D. Berkowitz and Allen E. Goodman, *Strategic Intelligence for American National Security* (Princeton, NJ: Princeton University Press, 1989); Richards J. Heuer, Jr., *Psychology of Intelligence Analysis* (Washington, DC: Center for the Study of Intelligence, 1999) and Lisa Krizan, *Intelligence Essentials for Everyone*, Occasional Paper Number Six (Washington, DC: Joint Military Intelligence College, 1999).

methods." However, even though collection methods are often arcane, methods of analysis are not very esoteric. Analytic methods used by intelligence analysts are readily available to specialists in the academic world.[6] The commonalities that do exist among collectors and analysts across the Community have rarely been noted in intelligence literature. The essays in this book will help fill that gap, and should illuminate for non-specialists the important role of self-reflection among intelligence professionals who remain in government service.

The contributors to this book share an interest in exploring and explaining intelligence collection and analysis practices.

Pauletta Otis, whose work has acquainted her with both the Intelligence Community and academia, outlines from experience the numerous similarities and differences between communities of academics and intelligence professionals. Her reminder that academics tend to be "contrarian" points up the value of academics having continual interaction with intelligence experts, in support of the Community's ideal, "nonmonastic" (not following the party line) approach to issues.

In the next essay, retired Navy Captain George Satterthwaite recounts how persistence and creativity when coupled with serendipity can contribute to gathering unique information that may thereby yield valuable intelligence. By taking advantage of his responsibilities as Defense Attaché to host official U.S. delegations, he gained access to important facilities in India for insight into Indian nuclear and naval capabilities. Intelligence professionals can readily relate to his spirited interaction with bureaucratic and political colleagues in the U.S. Embassy and the host country.

It may now be true that the value of intelligence to consumers is more dependent on the evaluation of information (grappling with mysteries) than on discovering "secrets."[7] If so, then the evaluation of social trends in various regions might best begin with systematic exploitation of authentic or "grass-roots" reporting from newspapers and other mass media. In the third essay, John Turner, senior Middle East and North Africa analyst at the U.S. European Command's Joint Analysis Center, illustrates his facility with exploiting multilingual electronic news media from North Africa. Translation and reporting by the Foreign Broadcast Information Service from such media is selective rather than comprehensive, and selections are not tailored for individual analysts, who are removed from first-hand screening of the sources. Therefore, language capabilities are indispensable for any country's intelligence personnel who seek insights through indigenous mass media. Language capabilities must mirror those tongues used across the electronic media that represent the target entities. Further, as noted in a recent news

[6] Many if not most analysts have been exposed, by training or experimentation, to such techniques as link analysis, the Delphi technique, and analysis of competing hypotheses. Morgan D. Jones, former CIA analyst, has distilled the less structured techniques that intelligence analysts may employ in *The Thinker's Toolkit: 14 Powerful Techniques for Problem Solving* (New York: Times Business, Random House, 1995 and 1998).

[7] For an "insider's" comparison of secrets" and "mysteries" see John C. Gannon, CIA Deputy Director for Intelligence, speech before the World Affairs Council, 20 March 1996. URL: *http://www.cia.gov/cia/public_affairs/speeches/archives/1996/ddi_speech_032096.html.*

report, the U.S. experience is that non-native, academically trained linguists who have lived abroad typically outperform native linguists in intelligence assignments that depend on language ability.[8] Dr. Turner's essay, with its emphasis on his own familiarity with North African news media reporting, illustrates that point.

Stephen Marrin reflects on his experiences as a new CIA analyst as he addresses whether and how formal training programs can impart the specialized knowledge, skills, and abilities necessary for meaningful intelligence analysis. He examines how the customary activity, processes, and organization of intelligence may have contributed to some failed aspects of intelligence prior to the events of 11 September 2001. He then suggests some specific ways to reinvent certain aspects of the national intelligence mission to allow analysts to bring greater persuasiveness to their value-added information.

U.S. Air Force Lieutenant Colonel Tom Garin examines how dignity and self-respect among professionals may be fostered within an intelligence organization. Garin defines the intelligence corporation in terms of a "learning organization" and then applies external standards from the Baldrige National Quality Program to selected intelligence-producing offices within the Defense Intelligence Agency. This benchmarking study not only identifies best practices, but also shows how such professional standards could be used to identify exemplary offices or individuals across the entire Intelligence Community.

Available literature does not yet address the question of what knowledge, skills and abilities are required, from the point of view of front-line managers, to support and sustain the evolution of intelligence tradecraft. David Moore and Lisa Krizan define a graduated set of criteria to calibrate an individual's suitability for an analytic position. Given the current Intelligence Community hiring surge, the set of core competencies they identify for NSA also provides a guide for the larger Intelligence Community to improve the professional stature of its workforce by defining who the analysts of the present and future ought to be.

The last essay reveals how the U.S. Coast Guard, having only recently joined the Intelligence Community, has already adjusted its organizational structure and its personnel system, expanded its participation in multi-agency initiatives, and developed procedures for more effective management of its unique position between civilian and military worlds. These rapid developments, stimulated by membership in the Community of Intelligence professionals, should enable the Coast Guard to anticipate and meet the requirements of both law enforcement and national security intelligence. As a fresh-faced affiliate of the Intelligence Community, the Coast Guard can inject an uncompromised determination to help the community live up to its name.

The essays collected here only begin to illustrate the potential of self-reflective writing by intelligence practitioners. If a communitarian ethos distinguishes intelligence professionals from their more individualistic and self-absorbed brethren in academia, then self-reflection among intelligence practitioners can also easily become a communal good. Tension between a communitarian and individualistic ethos can resolve itself among

[8] Susan Schmidt and Allan Lengel, "Help Still Wanted: Arabic Linguists," *Washington Post*, 27 December 2002, A23.

intelligence professionals through the strength of their bureaucratic (Weberian), nonmonastic tradition. The essays in this volume illustrate how, through self-reflection, that tension may be resolved. For example, individual professionals can easily spell out connections among these essays that would quickly move the discussion to a classified realm—into their "culture." That culture is typically characterized by fast-moving events and requirements that preclude introspection about the phenomena of intelligence collection and production.

Self-reflection not only allows the various agency sub-cultures to be displayed, as portrayed here, but also allows "insiders" to realize the subtle connections of their individual work to the overall enterprise. As a further illustration of this principle, the intense intellectual effort that characterized earlier eras of intelligence production and that continues as a part of the enduring culture, is evoked by the observations of William Millward, a World War II intelligence analyst at the UK's Bletchley Park:

> [Analysis] means reviewing the known facts, sorting out significant from insignificant, assessing them severally and jointly, and arriving at a conclusion by the exercise of judgment: part induction, part deduction. Absolute intellectual honesty is essential. The process must not be muddied by emotion or prejudice, nor by a desire to please.[9]

National intelligence collection management and intelligence analysis remain inherently government functions, and privatized intelligence—with its prospect of reduced congressional oversight—is even more antagonistic to the communal sharing of information than are the more stringently overseen bureaucratic fiefdoms.[10] In this environment, to "bring intelligence about" from the point of view of the American people requires peeling back some of the thick mantle of secrecy that has shrouded individual initiatives and management approaches—Community best practices—employed in the execution of ordinary and extraordinary tasks. Readers who look closely at the observations set down by the authors here will find a serviceable tool for unwrapping some of the otherwise enigmatic enthusiasms and motivations of government intelligence professionals.

[9] William Millward, "Life in and out of Hut 3," in F.H. Hinsley and Alan Stripp, *Codebreakers: The Inside Story of Bletchley Park* (Oxford, UK: Oxford University Press, 1993), 17.

[10] Across the Intelligence Community, the proportion of private, "contract" employees of all categories now stands at about 30 percent, and is growing. Few of these individuals are "independent" contractors, the great majority being associated with small or large private enterprises. Although most such contractors hold high-level security clearances based upon background investigations, the proprietary interests of their "parent" organizations can be at odds with an ethos of uninhibited sharing of information and perspectives. For an exploration of these issues, see James R. Sutton, *Subversion of a Government Monopoly: The Privatization of Intelligence Services* (n.p.: Research Intelligence Consortium, Inc., 2000). For information about the author, see http://www.trinitydc.edu/academics/depts/ Interdisc/International/Jim_Sutton.htm.

ABOUT THE AUTHOR

Pauletta Otis is Professor of Political Science and International Studies at the University of Southern Colorado. Her Ph.D. was awarded from the Graduate School of International Studies at the University of Denver in 1989. Dr. Otis held the position of Distinguished Visiting Professor of International Security Studies at the Joint Military Intelligence College in 1998 and then was Visiting Scholar for the National Security Education Program 1999, under the auspices of the National Defense University. She continues to teach summer sessions at JMIC and contributes to a number of defense research efforts. Dr. Otis maintains an active speaking schedule and has been guest speaker at a number of prestigious meetings including those held by the National War College, National Intelligence Council, Defense Intelligence Agency, Central Intelligence Agency, National Security Agency, U.S. Marine Corps, the Denver Committee on Foreign Relations, and other private and public venues.

Dr. Otis has special expertise in the study of sub-national violence and combines theoretical (from graduate degrees in Anthropology, Political Science, and International Studies) with operational experience and expertise. She has conducted field research in conflict situations in South Asia, Latin America, the Middle East, and the eastern Mediterranean.

THE INTELLIGENCE PRO AND THE PROFESSOR: TOWARD AN ALCHEMY OF APPLIED ARTS AND SCIENCES

Pauletta Otis

Recent events have led to an increasing realization that all of the resources of the American public must be engaged in support of national security. The U.S. academic community and the U.S. National Foreign Intelligence Community are institutional managers of "information as power." Yet their potential for useful cooperation and collaboration is unrealized and the relationship between the communities continues to be somewhat strained. This relationship has been the topic of discussions for many years in a somewhat benign security environment. With dramatic changes in that environment in late 2001, maximizing resources through enhanced cooperation and collaboration assumes critical importance. How can the Intelligence Community (IC) and the academic community best cooperate in support of national security? What are the inherent risks and challenges?

The theoretical challenge is of primary concern. Basic assumptions about the nature of democracy and the nature of secrecy are foundational to each of the communities' view of itself and of the other. The major theoretical concern for both intelligence and academic communities is the apparent contradiction between secrecy and democratic governance. From the academic's point of view, the U.S. Government's stability and its concern for the common welfare derive from the First Amendment. If a stable democracy depends on an informed public, the public cannot make good decisions without accurate and timely information. Without the "self-correcting" mechanism of free speech, a government tends to be subject to centrifugal forces, to spin on its own axis, and to become an entity quite separate from the citizenry.

Yet, on a practical level, we need to "keep secrets" from U.S. enemies, however they may be defined. A certain level of secrecy is required to protect national interests. How much secrecy is "best" in a democracy is subject to ongoing debate.[11] The pendulum swings over time and in response to perceived threats to national security. Subsequent to 11 September 2001, an acceptance of "more secrecy" has accompanied public support for the IC's enhanced role in homeland security. It may also be assumed that eventually a public reaction to perceptions of "too much" secrecy will move the pendulum back toward an historical center. Compromise between requirements to keep secrets must be balanced with the requirements of free speech inherent in the very definition of democracy. CIA Director Stansfield Turner (1977-1981), when he was at the center of the secrecy maelstrom, simply stated: "Accommodating secrecy in a democracy requires compromises with the theory of full freedom of speech, inquiry, and endeavor."[12] The problems inherent to this balancing act

---

[11] Pat M. Holt, *Secret Intelligence and Public Policy: A Dilemma of Democracy* (Washington, DC: CQ Press, 1995), see especially chapter 1.

[12] Stansfield Turner, *Secrecy and Democracy: the CIA in Transition*. Boston, MA: Houghton Mifflin Company, 1985), 112.

have been apparent in all aspects of contemporary American life, yet nowhere so fraught with difficulty as in the relationship between academia and the national security community. This tension, albeit normal, natural, and expected, is often most apparent and most difficult in the relationship between academe and intelligence professionals.[13]

The special caveat is that patriotism is not at issue: degree of commitment to this country is an individual attribute. Whereas the intelligence professional may work on a daily basis with threats to this country, the academic may work on supporting the values and attitudes necessary to sustain democratic life. One focuses on external threat, the other on the internal maintenance of the democratic system itself.

COMMONALITIES

Both the IC and the academic community work in the world of word-power. Both are populated by dedicated and committed Americans. In most cases, cooperative efforts have yielded the "best" for the United States in terms of public policy and decisionmaking. Yet, at other times, the communities have been at serious odds. The ensuing problems have been of significant concern to the attentive public and detrimental to the common good. These problems emanate not only from the theory of democracy but from competition over the nature of truth and value for the country. They can also be traced to concern about the nature and processes of intelligence gathering.

The IC and the academic community have much in common: both realize that information is power and that power comes in the form of words. These words form the basis of cultural assumptions, common concepts, and grand theory. In terms of information handling minutiae, intelligence specialists and academic scholars do much the same thing. They research, write, explain, and predict with excruciating self-consciousness and realization of the power of words. Intelligence professionals and academics contribute to public discussion in both oral forums and in written format. Intelligence professionals and academics are valued and participant citizens: They attend common religious services, participate in the education of children, contribute to community service organizations, and talk to neighbors. At this level, both are truly in the same "game." In the public domain, both intelligence professionals and academics contribute information, analysis, and opinions. These are read and integrated by the public, by policymakers, and by the "other" community. This common body of public information and analysis is at the core of intelligent decisionmaking in the United States.

For 50-plus years, relations between the IC and academia have wavered between cooperation and competition. The basic tension inherent in keeping "secrets in a democracy" has been played out in specific activities and attitudes. These can be seen at the individual, institutional, and political levels. At the individual and institutional levels, no doubt in part because of the strong influence of Ivy League academics in World War II intelligence

[13] Robert M. Gates, as CIA Deputy Director for Intelligence in 1986, addressed the John F. Kennedy School of Government at Harvard University on the relationship between the IC and academe. His address was published as "CIA and the University," in *Studies in Intelligence* 30, no. 2 (Summer 1986): 27-36.

(especially in the Office of Strategic Services), considerable rapport between academe and government intelligence was maintained.[14] Universities and study centers were also involved in the ongoing relationship between the intelligence and academic communities. Between 1939 and 1961, Yale University was overtly supportive of the IC.[15] Students and faculty were participants in intelligence collection and analysis. Study centers were financially supported and professional journals published. Information was collected and archived (including the Human Relations Area Files). The money was channeled to individuals or to institutions but seemed to raise few concerns.[16] At the political level, the existence of a "community" of intelligence-related agencies and offices has been noted in legislation, suggesting wide acceptance of the idea of government intelligence operations as regularized institutions with special taskings in support of U.S. national security.[17]

CONTINUITY, CHANGE, AND THE DEVELOPMENT OF DIFFERENCES

The "position descriptions" of an intelligence specialist and of an academic are polar opposites: The basic job of an academic is to find information, collect factoids whether they are useful or not–and scatter the information to the winds hoping and praying to make more sense of the ensuing chaos. Intelligence specialists collect similar factoids for very specific productive purposes. Whereas the academic is spreading information, the intelligence professional is collecting, narrowing, and refining data to produce reports, even if at the same time continuing an academic interest in the subject. The academic may learn for the fun of it; the intelligence professional prefers, or learns to be able to actually *do* something with the information. In the long run, the academic must write, produce, and contribute to the body of professional literature, but there is not the pressure for immediate production that the intelligence professional must face. The academic can say "that is interesting"; the intelligence professional must certify that "it is important."

---

[14] For example, see Roger Hilsman's *Strategic Intelligence and National Decisions* (Glencoe, Il: The Free Press, 1956), 7, 10. A Princeton academic, he explores the notion that "scholars could in some respects take the place of spies," and that academics, especially social scientists, could in the IC "find their real home within the formal structure of government."

[15] Norman Holmes Pearson, Yale graduate and former OSS official, suggested that the CIA recruit its younger personnel from universities and urged that each university have informal talent spotters who would forward names of likely candidates. See Robin W. Winks, *Cloak and Gown: Scholars in the Secret War, 1939-1961* (New York: William Morrow Publishing Company, 1987), 315.

[16] Winks, 14-19, notes that Nathan Hale, a Yale graduate, is of special interest as the first "spy" executed for his work. Other noted Yale personages involved with intelligence activities include: Arnold Wolfers, Sherman Kent, Chester B. Kerr, James Angleton, C. Bradford Wells, Norman Holmes Pearson, Dean Acheson and Richard Bissell.

[17] Edward F. Sayle, "The Historical Underpinning of the U.S. Intelligence Community," *International Journal of Intelligence and Counterintelligence* 1, no. 1 (Spring 1986): 1-17.

Another point of conversation and contention is the responsibility for the ultimate use of information power, whether of technical or human origin. Is the individual who has the information and gives it to the "government" responsible for the ultimate use of that information? Referring to scientific advances in weaponry during World War II: Was a scientist who invented a weapon responsible for the ultimate use of that weapon? If the academic-scientist gave information to the government, did the very nature of government absolve him from guilt if it were to be used in a way not foreseeable by the scientist? Did it matter whether the government was a "dictatorship" or a "democracy"? On the human intelligence side: Were doctors and scientists, conducting scientific experiments on human populations in concentration camps and under the direction of government officials, responsible for the use of that information? What if the information eventually saved lives, albeit those of a Fascist regime? During the Vietnam era, the question was raised in another context: Information concerning populations in Laos, Cambodia, and Vietnam, collected by anthropologists, was subsequently used in support of the war effort. What was the ethical and moral responsibility of the information gatherer? Did they "sell out"? And, if so, what did they sell out to? Is final use of HUMINT the combined responsibility of the collector and disseminator? The ensuing and subsequent debates have been acrimonious, difficult, and divisive.

On the West Coast, and during the Cold War, the strain between academics and the IC contributed to a number of very ugly scenes. Distinctions were made between those academics who were "patriotic, loyal, and anti-communist," and those who challenged authority in any context. Simple questioning became a sign of disloyalty. Universities were increasingly supported by public funding, and administrators were increasingly drawn from a professional management pool rather than from the scholarly community, resulting in a view that universities were simply another form of business enterprise. Administrators were often afraid to allow challenges to government on the part of the faculty out of fear of losing funding. The divisiveness of this period cannot be overemphasized in explaining the nature of the contemporary public university. Administrative penalties for individual scholars included blacklisting, failure to get tenure, lack of research support, and even dismissal from teaching positions. The public presentation of "truth" was simple: teaching loyalty to the country was the real job of the teacher/ academic. Anything contrary was a serious and significant challenge to the future of the nation. And, if the public supported the university both financially and with its "children," it in turn should be able to expect loyalty on the part of its faculty employees. The long-term effects of this controversy were devastating: a certain level of self-censorship on the part of academics, serious mistrust between university administrators and faculty, and reluctance of faculty members to cooperate with intelligence agencies. The communities became unnecessarily, but understandably, polarized.[18]

---

[18] Ellen W. Schrecker, *No Ivory Tower: McCarthyism and the Universities* (New York: Oxford University Press, 1986).

A significant problem for both communities is the strangulation that can occur through bureaucratic-institutional rigidities. The academic community is quite aware that real education *could be* much better but that the *status quo* supports the professoriate; that is, change is always a bit dangerous as it usually means a diminishment of academic independence and an enhancement of administrative power. The IC also would admit to bureaucratic complacency in times of peace. Changes incur costs either in the diminution of capability or loss of institutional "territory." Both the intelligence professional and the academic are, to some extent, prisoners of their own bureaucracies and are habitually resistant to change.

There is an attendant problem: Neither of the communities is monolithic, although that stereotype persists. Most academics do not know the difference between the CIA and DIA nor the nature of their specific mandates from Congress, except perhaps in "wartime," when such differences become more widely known through media coverage. Similarly, intelligence professionals often lump all colleges and universities and hence the professoriate into one big resource group. Intelligence professionals make it their business to know their colleagues in other agencies; academics know who is working on "what," the relative integrity of individuals and institutions, and the unwritten division of labor in the university system. This information is buried in the collective consciousness of each community and remains difficult to exhume—hence the persistence of the monolithic stereotype

Each community has a body of common knowledge which it assumes everyone working within the institutional framework knows and accepts. Because common knowledge is "common," it is not self-conscious and most individuals do not even realize that basic assumptions are seldom challenged. For example: the academic community assumes that books are good and thus libraries should have them. Individuals in the IC often assume that books are inherently historical and that current information and intelligence must be "near-real-time" and continually refreshed. There is a distinct attitude of arrogance when these individuals discuss the currency of information with academics. What is not at issue, of course, is that the intelligence professional has to produce and is charged with an indications and warning responsibility mandating inclusion of current information.

Academics are known for jargon and obfuscation; the IC is known for producing acronyms seemingly at leisure. The tribal languages are difficult to learn without a willing translator. Such facilitators may be hard to find because language serves to define the in-group and the out-group and what can or should be communicated within the organization and to outsiders. To illustrate, the academic community believes that the title "doctor" is best reserved for a medical professional and that the title of "professor" connotes sufficient recognition of achievement. However, the military and intelligence communities rigidly and habitually call academics "doctor," sometimes embarrassing both parties. At the same time, the IC has a specific ranking for directors, analysts, collectors, and techies, and for military and civil service personnel. These are totally obscure for the academic working within the community. They don't know the differences and often do not want to take the time to learn.

Rules of interaction for each group differ significantly. Academics are notoriously fractious and democratic. Anyone can challenge anyone on any idea at any time–and do so. Sometimes it is not very polite or courteous even when the comment begins with: "I understand your premise, *but*, have you considered.....?" Bloodletting is the rule rather than the exception. Members of the IC appear to be more polite although "outsiders" may assume that they derive enjoyment from more discreet disagreement. The various forms of interaction are notable when individuals from the IC quietly participate in sections of the International Studies Association or the Political Science Association, or when academics vociferously contribute to conferences held under the auspices of the IC.

Prejudices and stereotypes held by each group toward the other are often very funny and uncomfortably accurate. The intelligence professional hides in a secure building; the academic retreats to the pie-in-the-sky ivory tower. The intelligence professional is not excessively talkative; the academic cannot be bridled. It is assumed that academics and scholars are in never-never land with theory that cannot be proved or disproved. The intelligence professional is said to live in a land of basic facts without understanding the "big picture." When specifically challenged, both sides recognize that one cannot have facts without theory nor theory without supporting evidence. Yet the stereotypes remain and there is misunderstanding and misinformation on both sides and few venues to correct those that cause problems in communication.

There is further the problem of "group-think" on both sides. Each assumes not infrequently that they have a lock on reality and often simply refuse to be open-minded. This occurred during the Vietnam era when the IC felt itself misunderstood and abused, and the academic community believed that its information and personnel were being used by intelligence agencies in ways of which academe did not approve. The complexity of the story is well-known but the mythology remains extant.[19] Part of the mythology is that intelligence agencies will collect information from academics but not return or share information in a collegial manner. On the other side, the assumption on the part of intelligence professionals is that the academics have a bad attitude and misunderstand or undervalue the IC contribution to national well-being. The academic community believes that it is not afflicted with the IC's tunnel vision and can contribute to lateral thinking that supports enhanced problem-solving capabilities.

THE ACADEMIC'S DECISION

The motivations for an academic to work for the IC are, of course, individualistic and mixed. He or she may simply want a "steady" job that pays well–even if only working over the summer break. There can also be an ego boost when intelligence experts value the information and assessment done by an academic in a particular field. The value attached to being "appreciated" for the information and analysis cannot be overstated as there is very little of that inherent in the academic community. It is also possible that an

[19] Note the references to news reports and other material on websites devoted to the use and abuse of intelligence during the Vietnam Era.

academic simply wants a new and important challenge and seeks to contribute to a group effort designed to enhance national security.

A number of problems may emerge if an academic goes to work for the IC, becomes a contractor, or produces information that can be used by that community. He may "go native," that is, become more "intelligence-centric" than the IC needs or desires, all in an attempt to "belong." There is a tendency for self-delusion and thinking that the information contributed is going to "make a difference." Sometimes it does; sometimes it is just part of the package provided for a specific tasking. The academic really has no way of knowing what impact his or her work is having.

There are special areas in which the academic can contribute to the IC. A primary contribution is in the collection of facts and information using sources that the IC is precluded from using. Academics can generally travel more easily than intelligence analysts and can establish human networks across international boundaries that can be very useful especially in times of crisis. Academics generally are trained in the development of analytical frameworks and employ them with a degree of ease and clarity. Many academics contribute a unique ability to critique or evaluate projects based on a wide reading of the literature combined with "on the ground" experience. The good academic is always a perverse thinker–looking to examine the null hypothesis or suggesting alternative explanations. They tend not to accept the "generally accepted explanation." This habit can make them a bit difficult as conversationalists especially if "critique" is translated as "criticism." A good academic scholar will insist on "rigor," as in following the requirement to test basic assumptions, validate criteria used in hypothesis building, monitor the internal validity of hypotheses, and pinpoint the public implications of certain theories. Academic rigor mandates "elegance"; that is, a hypothesis must be important, clear, and predictive. Even in descriptive analysis, an academic insists on looking at a range of possible alternative choices and at the internal coherence of the final product.

There is another caveat: most academics believe that intelligence professionals are better paid and have more job security for doing similar work. This may imply that academics will skew their work in order to get the "big bucks" that the IC is assumed to have sitting in a back room. The serious implication is that there is a potential for academics to give up academic integrity and play to the audience in order to get government contracts. On the other hand, if it is only supplemental income for the professors, the extra income can be very supportive of the academic profession at large. It is worth noting that salaries of academics vary hugely across the spectrum of colleges and universities and in different regions of the country.[20] It must also be noted that if academics are taking up intelligence taskings, they are not generally able at the same time to write for publication in scholarly journals. Participation in conferences is also limited and inter-academic communications suffer as a consequence.

---

[20] Approximately forty percent of all U.S. academic positions are adjunct or part-time. These pay somewhere in the range of $1,500 to $3,000 per class, which roughly translates as $24,000 a year for someone with an advanced, terminal degree.

There are a number of roles that academics can have in the IC: teaching, conducting research, consultation on specific issues, monitoring, evaluating programs, collaborating with other professionals on special projects, and holding conversations on issues of mutual concern. Most of these areas have been exploited to one degree or another. An area that is often overlooked is that of professional development. After all, many professors have spent a great deal of time teaching, testing, and designing learning materials. Not all are good at it–but many have considerable skills that could be tapped. Another specific area is in the teaching of research methodology and specialized writing. Intelligence professionals are sometimes criticized on their ability to effectively and efficiently engage the audience in oral presentations of their ideas and materials. Perhaps specific individuals in the academic community would be helpful in teaching and supporting that skill development.

The ultimate caveat: it is hard to explain to professional colleagues that "I am not a spy." The mystique outlives the reality. It can be overcome with honesty and some degree of good humor.

There are specific benefits to the IC if academics and scholars are employed wisely. One of the often-heard criticisms of the IC is that it has a special susceptibility to "group-think" because analysts seldom have internal challenges. Projects, after all, are group-produced and tend to reduce an individual's unique contribution in favor of the final product. The academic, simply by the nature of the job, challenges the norms, supports individual initiative and creativity, and values novel or unconventional thinking.

SUGGESTIONS FOR MUTUAL SUPPORT AND MUTUAL BENEFIT

For all of the reasons just noted, it is important that the IC encourage the participation of academics. Academics can make significant contributions in creative thinking, rigor of analysis, and professional presentation of products.

But the choice of which academic to invite as a participant and the venue for participation are not givens. The IC might do well to choose individual academics not for their geographic convenience, near to the Washington or New York areas, but for the written scholarly work produced in their "home environment." Some of the work is apparent at professional conferences such as those of the International Studies Association and the Political Science Association. Some academics, however, do not "conference." They do, however, write and produce articles for journals and books for publication. These individuals can be found by reputation in the community, in reading lists, and in lists of current publications provided by commercial book publishers. Another often-neglected academic source is the database developed by University Microfilms International (UMI) of Ann Arbor, Michigan. Its widely available "Dissertation Abstracts International" indexes over 1.5 million dissertations from the U.S. and some other English-speaking countries.[21]

It matters little whether the academic is familiar or comfortable with intelligence or intelligence agencies: what matters most is honest and clear communication. In the

author's first association, I was promised that all materials could and should be "open source" and that I had final say on what information went into the project. Because I was aware of the potential for harm to informants in an ethnic violence situation, this became critical support for my contribution to a specific project.

Think tanks are very peculiar instances of hybridization. What the IC does not often realize is that Rand, Hoover, and Carnegie are assigned specific status by academics. It is assumed that "since they get their money directly from the government," they are somehow tainted. Research is suspect and academic integrity is assumed to have been compromised. Nevertheless, the tanks pay very well and very fine academics contribute substantially to critically needed and specifically targeted research.

Universities are not monolithic. Many will support technical research financed by the U.S. Government, but distance themselves from government "intrusion" in the social sciences. This is understandable but can be challenged if those interested in "public-private" interchange develop or appeal to a board of monitors or research advisors.[22] The IC is not precluded from supporting social-cultural research. There have been any number of works emanating from political science departments on topics relating to democracy and development. Economics departments are enthusiastic contributors to development projects and economic distribution issues. Most universities are giving increased attention to environmental issues including environmental security.[23]

Another touchy but important area is in the potential contribution of information and understanding by visiting foreign students and visiting professors. It is well recognized that using undergraduate students in this sense remains fairly unproductive. There is an ongoing debate about getting information about, tracking, or using graduate students. Certainly the base of internationally focused information available on university cam-

---

[21] The University of Minnesota maintains a database for U.S. Master's theses and Ph.D. dissertations These are abstracted and available through the UMI system. Further information can be found on their respective websites: http://www.lib.umn.edu and http://www.lib.umi.com/dissertations.

[22] Widely used "Institutional Research Boards," for example, could address ethical and other issues even before they arise. For a useful discussion of the role of IRBs, see Bruce L. Berg, *Qualitative Research Methods for the Social Sciences*, 3rd ed. (Boston, MA: Allyn and Bacon, 1998), chapter 3.

[23] Although there is no evidence of specific linkages between the IC and the following examples, these academic authors are often quoted by the IC in support of new models relating intelligence requirements to a broadened definition of security: Jack Snyder, *From Voting to Violence: Democratization and Nationalist Conflict* (New York: W. W. Norton, 2000); Georg Sorensen, *Democracy and Democratization: Processes and Prospects in a Changing World* (Boulder: Westview Press, 1998); James G. March and Johan P. Olsen, Democratic Governance (New York: Free Press, 1995). On environment issues related to security, see *Environmental Conflict*, Paul F. Duiehl and Nils Petter Gleditsch, eds. (Boulder: Westview Press, 2001) and *Ecoviolence: Links among Environment, Population, and Security*, Thomas Homer-Dixon and Jessica Blitt, eds. (Boulder, CO: Rowman & Littlefield Publishers, Inc., 1998).

puses could be more usefully (and publicly) exploited. In the current environment, most universities have been encouraged to check on the legal status of their international students, especially those coming from countries known to support international terrorism. International student offices and university administrators have had mixed reactions. The international students are a source of out-of-state tuition and contribute to the overall diversity of a campus. International student counselors and offices have historically acted as advocates for the guest students. There is some reluctance to take on a "law enforcement" function, however much individuals may support anti-terrorism efforts.

Specific programs have been developed by the CIA and DIA for encouraging academic participation with the IC. These efforts need to be encouraged, regularized, institutionalized, and adequately financed. The Scholars-in-Residence program of the Central Intelligence Agency is well known.[24] The Fulbright Senior Fellowship program, funded through the Department of State, is invaluable. Most informal or formal interaction takes place through individual consulting, sponsorship and organization of topical conferences, funding of individuals for specific research of mutual interest and concern, funding and support for research centers, and informal conversations at any one of the periodic, internationally focused academic conferences. This interaction can be highly productive because both parties tend to focus on international issues of mutual concern, and bring special expertise to bear for creative and constructive problem solving.

CONCLUSION

Academics and intelligence professionals are concerned with much the same set of problems. The approaches to problem solving may differ but certainly the practices inherent in American democratic tradition have constructed the intellectual environment so as to provide common definitions of contemporary threats and challenges. Both communities agree that liberty, democracy, freedom, equality, law, and property are defensible American values. Cooperation between the IC and academics, and specific contributions that academics can make to the production of good intelligence, can and must be further supported. It would be foolish to waste available skills and talent. There is too much at stake.

ABOUT THE AUTHOR

Dr. John Turner is the senior Middle East and North Africa analyst at the U.S. European Command's Joint Analysis Center, where he is responsible for strategic estimates. His past assignments concerned with the Middle East and Africa region include estimative, counterintelligence, and current intelligence analytical postings in the U.S. and Europe. He has traveled widely in the Middle East and Africa. Dr. Turner earned degrees in Near Eastern Languages and Literatures from the University of Michigan and Yale University.

VIA THE INTERNET: NEWS AND INFORMATION FOR THE ANALYST FROM NORTH AFRICAN ELECTRONIC MEDIA

John Turner

The remarkable growth of electronic media over the past decade in Francophone North Africa provides specialists in the region with a wealth of news and other information. This survey and analysis of the French-language media of Algeria, Morocco, and Tunisia examines how these media go about providing information on North African politics, economics, and culture in a way that does take account of expatriates, who make up an important sector of the politically active population. For "outsiders" who specialize in the interpretation of the region, news media offer a "grass-roots"-based prism through which future developments may be anticipated.[1] Observable trends in the North Africa media, when carefully documented and placed in context, validate the contention of various authors, from Robert Steele and Gregory Treverton to Arthur Hulnick, who have addressed the promises and perils of devoting a greater share of intelligence resources to the exploitation open-source information. They have found much more promise than peril.[2]

REGIONAL MEDIA CULTURE

The political context in which North African media have evolved over the past three decades is chiefly one of centralized governments tending toward authoritarianism, be it oligarchical in the case of Algeria, monarchical in the case of Morocco, or presidential in the case of Tunisia. The political institutions of each country developed separately in the post-colonial period and in each country a different media culture exists that has until now clearly defined the role of the broadcast and print media. However, through the 1990s, as Internet access and use spread to the region, the public in each country, as well as the expatriate North African communities in Europe and elsewhere are proving to be a major

---

[1] An early and prescient example of this approach to "futurology" is in John Naisbitt's *Megatrends* (New York: Warner Books, 1982). Naisbitt's approach to trendspotting was to scan thousands of local newspapers in the U.S. and to extrapolate trends unobtrusively from those "grass roots" sources. This approach is explained in pages 8-9 of the book.

[2] For example, see Steele's *On Intelligence: Spies and Secrecy in an Open World* (Fairfax, VA: AFCEA International Press, 2002); Treverton's *Reshaping National Intelligence for an Age of Information* (Cambridge, UK: Cambridge University Press, 2001), chapter Four; Hulnick, "The Downside of Open Source Intelligence," *International Journal of Intelligence and CounterIntelligence* 15, no. 4 (Winter 2002-2003): 565-579.

new political factor.[3] This development results from the web's provision of news, including both analysis and opinion, as well as useful business information. Governments now experience strong competition from non-state run media due in large part to the use by the latter of the Internet.[4]

The political and business elites in Algeria, Morocco, and Tunisia have spearheaded the public demand for information to support their routine decisionmaking. Exposed increasingly over the past four decades to European and other media, North Africans desire that their domestic media mirror standards set elsewhere in the region and the world. It is in the electronic versions of the region's print media that this expectation has been most fully realized. Since the late 1990s a host of daily and weekly periodicals have developed electronic news sites, most backed by their parent print news organizations. Although the discussion here focuses on the French-language dimensions of this phenomenon, the reader should be aware that in each country a rapidly growing Arabic electronic media culture exists as well.

SURVEY OF NORTH AFRICAN ELECTRONIC NEWS MEDIA

Algeria

Algeria's electronic media culture is dominated by Internet versions of the country's French and Arabic-language newspapers. For the former, there are a dozen Algiers-based dailies and one Oran-based daily that cater to audiences in Algeria and Europe (see table below). Electronic versions of Algerian newspapers began in the early 1990s to provide the Algerian community abroad, especially in France, with news.[5] As of late 2002 thirteen dailies[6] are available on the Internet, all regularly maintained and updated daily. Algerian dailies are increasingly user-friendly and most have undergone facelifts as they make a bid for an increasingly sophisticated audience at home and abroad. Generally these

[3] Naturally, this development is recognized by those predisposed to shape public opinion. On the information-media contest between religious and secular forces, see Dale F. Eickelman, "The Coming Transformation in the Muslim World," *Current History* 99, no. 633 (January 2000): 16-20. For further background, see Eickelman's book, *New Media in the Muslim World: The Emerging Public Sphere* (Bloomington, IN: Indiana University Press, 1999).

[4] For discussions of the pre-Internet media in North Africa during the Cold War era, see especially the U.S. Army publications *Algeria: A Country Study*, fourth edition, 1985, 268-271; *Morocco: A Country Study*, fifth edition, 1985, 277-280; and *Tunisia: A Country Study*, third edition, 1986, 249-252. For coverage of post-Internet media developments, see *http://www.hrw.org/advocacy/internet/mena/index.htm*.

[5] See Elias Hanna Elias, *La Presse arabe* (Paris: Maisonneuve & Larose, 1993), 94. The government press monopoly was only ended in 1988. A snapshot of the evolving press culture in Algeria in the early 1990s is given in the fifth edition of *Algeria: A Country Study*, 1994, 218-220.

[6] One of them, *L'Expression*, was dormant for most the month of November 2002, reappearing at the end of the month after a remake (*www.lexpressiondz.com*). Such episodes are common with other electronic dailies in Algeria, which can unexpectedly be down for long periods of time while their web sites are redesigned.

changes have seen progressive upgrades in graphics quality, reliability of links, and web page format. In late 2002 alone, two dailies, *Liberte* and *Le Soir d'Algerie,* have both undergone major changes in the "look and feel" of their web sites.

Algerian French-Language Daily Newspapers on the Internet

In contrast to the wealth of dailies represented in the electronic media, there is a dearth of Algerian weeklies available on the Internet. Some of the daily web sites have "weekend"-oriented articles appearing in their Thursday or Saturday editions (Algerian papers and their electronic counterparts are not issued on Friday). However, only three of them at the time of writing had multimedia "magazine" supplements.[7]

Algeria's government news site is the Algerian Press Service (APS),[8] which has web pages in Arabic, French, English, and Spanish. APS has news offices throughout Algeria and updates its web page of news items daily. Many of the news dailies discussed below use APS reports. However, most have their own network of reporters throughout Algeria and rely upon APS and international wire services for foreign news.

Daily press summaries are provided on two independent web sites. The first is offered by Agence Algerienne d'Information (AAI),[9] which has a detailed daily press review covering the headlines of the nation's French and Arabic language newspapers. A briefer ver-

[7] These were the *Jeune Independant* ("JI Multimedia"), *Le Matin* (*MultiM@tin*), and *La Tribune* ("*La Tribune Multimedia*"). In addition, *Le Matin* had a topical section updated every several weeks.

sion of the country's daily press offering is found on the website of the "Algeria Guide."[10] *El Watan*[11] is one of the oldest of the electronic dailies appearing on the web, and caters to a French-speaking audience at home and abroad. El Watan is widely cited as a news daily of record.

In addition to the French-language dailies noted in the table, one cannot ignore Algeria's leading Arabic language daily, *El Khabar*.[12] Starting in 2001, daily editions of this paper in Arabic have been supplemented by English and French headlines pages.[13] Each consists of a brief summary of the daily print and electronic edition's major stories. Although the English and French sites are similar, the choice of items for summarization from the Arabic original is not all-inclusive. Nevertheless, these pages are important for non-Arabic readers as an insight into the reporting focus of Algeria's largest daily.

Morocco

In contrast to Algeria's thriving daily Internet news culture, Moroccan electronic news media represent a combination of daily and weekly web sites. The daily print news providers and their electronic web sites (see table below) are dominated by four major papers. However, the news culture of Morocco is also marked by a strong showing of news weeklies, many of which are relatively new since the end of the 1990s and the accession of the present monarch, King Mohamed VI, to the throne.

Moroccan French-Language Daily Newspapers on the Internet

Moroccan dailies have been appearing in electronic form since 1998, when the semi-official *Le Matin du Maghreb et du Sahara* began Internet publication. *Le Matin* was later followed by the newspapers of three of the political parties of the center-left Koutla coalition in the parliament. These papers still form the backbone of the electronic daily publi-

cation, joined only by the independent *L'Economiste* and *Le Quotidien du Maroc*. Morocco's news dailies are still largely the domain of its political parties.[14]

Morocco's national news agency is the *Maghreb Arabe Pres*se (MAP),[15] which has web sites in English, French, Arabic, and Spanish. MAP, as well as international wire services, provides domestic news dailies with foreign news and some domestic news items. MAP hosts a French web site that provides a daily press review of nineteen French and Arabic dailies.[16]

Le Matin du Maghreb et du Sahara has the largest print circulation and its web version also dominated the electronic media after its 1998 launch. However, the first web site was extensively overhauled in September 2001, changing from one primarily mirroring the print edition to one with distinctive content that was also distinguished with a distinct name—*Le Matin.ma*[17]—to emphasize its web status.

Tunisia

Tunisia's electronic press remains restricted compared to that in Algeria and Morocco, with the country's Internet activity subject to close government scrutiny. The paucity of news dailies (see table below) and the availability of foreign print media at the present time combine with government controls to produce an electronic media culture that focuses heavily on business and commerce, as well as non-controversial domestic and foreign news items.

MEDIA ISSUES: OBJECTIVITY AND ACCURACY

The political heritage of North Africa and its impact on the region's media culture together raise the inevitable questions of editorial freedom, objectivity and accuracy. The ideal standard for North African publications, as in other countries, is one of adherence to strict standards of reporting and analyzing events in a climate of universal press freedom. However, "red lines'' exist in editorial freedom, objectivity, and accuracy that are perilous to cross. North African media have suffered negative sanctions imposed by government officials as the result of reporting that has broken taboos.[19]

Objectivity is a concern for analysts and researchers in a media culture where most papers, not only those owned by manifestly political groups, but also the independent press, are controlled by interests that have a marked political agenda. Nevertheless, in both Algeria and Morocco a system of checks and balances exists, with daily and weekly print media and their electronic counterparts in vigorous competition for the domestic and foreign market. These publications maintain high standards of journalism, and are normally quite open about their particular biases or journalistic objectives. Such competition and declared interests ensure a degree of confidence in political and economic analysis that allows a high degree of confidence among business and government consumers who seek information for decisionmaking. Tunisia, with its dearth of news dailies and strong government influence in the media, remains problematic for the area specialist seeking in-depth analysis of some events, although most economic and business reporting remains of high quality and supports its citizens' decisionmaking effectively.[20]

Accuracy has historically been less of a concern. A flourishing media culture and rivalry among news dailies and weeklies in Algeria and Morocco ensures a degree of competition that normally means news items are reliable; that is, consistently reported in different publications with a sufficient degree of detail and verification of factual data to make them satisfactory records of events. In such an information-rich climate, attempts by government or private parties to plant stories would be subject to immediate scrutiny and detection by the press. The latter frequently analyzes government reporting on an issue and takes it to task for various shortcomings, thereby ensuring, through the resulting reliability, that validity or accuracy is also addressed.

NORTH AFRICAN MEDIA AS A SOURCE OF INFORMATION

The electronic media in Algeria, Morocco, and Tunisia remain tied to their print media roots. This is an economic necessity, as too few in these countries lack the disposable income to rely on the Internet as their main source of information. Printed newspapers,

[19] Recent problems encountered by journalists include cutoff of advertising support in Tunisia (*El Maoukif*, 21 December 2001), as well as outright government seizure of publications in Morocco (*Al Mostaqil*, 1 May 2002).

[20] For the Arab world as a whole, these observations are supported by Dale F. Eickerman, "The Arab 'Street' and the Middle East's Democracy Deficit,'' *Naval War College Review* 55, no. 4 (Autumn 2002): 39-48.

either daily or weekly, are relatively cheap and widely available, and within the means of most of the region's population. So long as the region's economic problems continue, there will be limits on disposable income that impact the ability of the electronic media to be of practical use to its intended audience.

Databases, and their extent and degree of searchability, remain issues for the researcher. In terms of media-based interpretation of North African countries, there is little consistency in whether or not an electronic daily or weekly has links to past editions, and how easily they can be accessed and searched. The majority of electronic news media still offer no search capability, forcing readers to access past editions one by one in the hope of finding specific news items. Media storage capabilities often limit web sites from offering more than a few months' worth of past issues. Certain publications, such as those of the Moroccan *L'Economiste, La Vie Economique*, and *Maroc Hebdo*, are prominent exceptions. But with most other electronic publications from the region, the researcher's quest is often frustrated by lack of archival depth and broken links. Remedies to the current deficiencies will be slow in coming and dependent on additional data storage availability and improved website management.

Reporting of events, as noted above, is as objective and accurate as that found anywhere in the world. The electronic media in Algeria and Morocco are often the single best source of news for outside researchers who try to interpret the climate of opinion and incipient trends that exist in the interior of these large and increasingly complex countries. Local news is a growth industry in Morocco, but has yet to become well-established in Algeria or Tunisia. However, the steady growth of electronic media and the institutionalization of its culture as a normal supplement to the print world promises that local newspapers will soon be much more available in electronic form via the Internet. Such sites, however, are as likely to be in Arabic as in French, depending upon the local population and the degree to which the outlet has an expatriate readership.

Electronic news media are slowly but certainly being augmented by independent Internet sites. Such sites are still relatively few due to their lacking a solid print media base to finance electronic editions. However, the provisional success of *CasaNet* in Morocco[21] and *Cirta* in Algeria[22] probably indicate a proliferation of these sources.

[21] *www.casanet.net.ma* is the web site address of *Menara: La Portail du Maroc*, hosted by Morocco's largest telecommunications company, Maroc Telecom. Menara previously hosted the Moroccan electronic dailies *Liberation* and *al-Bayane*, but both now have their own independent sites.

[22] *www.cirtaonline.com/news/* has a constantly updated listing of world, national, and local news. Despite its name (Cirta is the old Roman name for the eastern Algerian city of Constantine), the site is national in scope, leaving local news to the Arabic-language daily *an-Nasr* (*www.an-nasr.com*).

It remains uncertain whether electronic news dailies or weeklies will come to dominate the Internet news market in North Africa. Much depends on the fortunes of their parent print media companies, trends in the news-reading public's interests, and the rate of growth of the local economies in North Africa and the amount of disposable income available to the general population to sustain further growth of the electronic media. Until personal computers and affordable Internet access is commonly available, most North Africans will still rely on the print and broadcast media as their primary forms of news information. In this situation, access by the public to the Internet will remain largely confined to the "Internet Cafes" that are burgeoning throughout the region. Such a situation will sustain only modest electronic media growth.

Under these circumstances, it is likely that one of the key factors in the growth of North African electronic media is likely to be the expatriate community in Europe.[23] The latter enjoy sufficient disposable income and have the motivation to make use of the Internet to follow events in their countries of origin, including at the local or community level. The increased interest by European business and government professionals in North African affairs also provides a potential growth market for electronic media. These professionals often seek and indeed require more information beyond the apparent wealth of data currently available. Catering to such audiences—the expatriate and foreign business/government community—will tend to ensure that in the electronic media world French (and possibly English) news availability will dominate, despite likely future gains by Arabic in the print media world in North Africa itself.

OUTLOOK: INCREASED COVERAGE, GREATER DEPTH

In general, North African, electronic French-language news media still follow the lead of their print counterparts. This is due to the limited access of the population to computers and the Internet, and the continued reliance of the public on broadcast and print media. Further, most media advertisers remain wary of investment in Internet sites, a factor that limits them to being sponsored by established media interests, such as the print media. Nevertheless, the growing number of home computers and Internet connections is bringing the first steps of transformation.

For observers of North African affairs, trends in the French-language electronic news media are reassuring for the near future. Area specialists and other interested professionals will have a steadily growing body of information from which they can draw

---

[23] The North African community in Western Europe numbers approximately two million. For details on numbers and other particulars, see Sarah Colinson, *Shore to Shore: The Politics of Migration in Euro-Maghreb Relations* (London: Royal Institute for International Affairs/Middle East Programme, 1996), especially the table on page102; and *Migration aus Nordafrika: Ursachen und Problem*, ed. Michaela Koller (Martinsried, Germany: Ars Una, 2000), especially 8ff. and 60ff.

for a reasonably authentic representation of social trends. If political, economic, and social information remains readily available without the geographic limitations associated with print media distribution, the confidence level in information associated with this region among government and business interests worldwide will continue to improve. The ability of North African intelligence specialists to take advantage of multiple rather than single-source information to provide analysis to decisionmakers will, however, increasingly have to take account of Arabic-language media as well as independent Internet news sites in order to ensure a more complete picture of events.

ABOUT THE AUTHOR

Early in his career, as operations officer on the WWII Fletcher-Class destroyer USS *Benham* (DD796), **CAPT George Satterthwaite** became intrigued by the international aspects of being a U.S. Navy officer. The Benham was about to be transferred to Peru under the Military Assistance Program, and he was to accompany a Peruvian crew to Norfolk for underway training, and then go on to Callao where the re-christened *Villar* was to be the flagship of the Peruvian Navy. But he was transferred instead to the Naval Academy to teach calculus. After a tour on a diesel submarine, he left active service, and joined the inactive reserves. Twenty-two years later, in 1986, he discovered that the Navy was looking for individuals to serve attaché duty in hard-to-fill jobs in the Third World. Peru was on the list, and he soon began training and education to become Navy DATT/ALUSNA (Defense Attaché/American Legation U.S. Naval Attaché) in Lima. As he was about to enter Spanish language training, his assignment to Latin America was cancelled, and he was reassigned to be ALUSNA New Delhi where he served for four years from 1988 to 1992.

Having enjoyed his tour in India immensely, CAPT Satterthwaite asked to be reassigned to another Defense Attaché Office (DAO), and was sent to Jakarta for three years (1993 to 1996). During his last year in Jakarta he remarked to his Navy personnel detailer that he had enjoyed the 10 years of active duty time despite the fact that he did not get to go to Peru. The detailer exclaimed that he was having a very tough time filling the DATT/ALUSNA job in Lima, and asked CAPT Satterthwaite to apply once more. At age 60 CAPT Satterthwaite and his wife entered language training for the third time and, after a few months at the Defense Language Institute, went to Lima for a two-year assignment. UNITAS, the large Western Hemisphere, Navy-to-Navy exercise, was inaugurated in the year CAPT Satterthwaite was originally supposed to go to Peru (1960). In 1998 and 1999 he oversaw the planning and implementation of the 38th and 39th cruises. He ended his career as a Naval Attaché in a ceremony officiated by the Chief of Staff of the Peruvian Navy, who had been on the Villar (ex-Benham) as a junior officer. Also in attendance at that ceremony was CAPT Satterthwaite's relief on the Benham, VADM (Ret) Daniel Mariscal. Coincidentally, VADM Mariscal was a 1954 graduate of the U.S. Naval Academy, and CAPT Satterthwaite's father had been his sponsor.

Between active duty assignments, CAPT Satterthwaite had a varied and diverse career. In 1979, he earned a Ph.D. in Public Administration and later taught at The American University, the Naval War College and the Monterey Institute of International Studies. He was also an operations research analyst at the Johns Hopkins University Applied Physics Laboratory, and has served as a consultant to federal, state, local and tribal governments. He now teaches occasionally at the Defense Resource Management Institute, volunteers his time teaching math in a local high school, and is a member of the Monterey County, California, Civil Grand Jury.

VISIT TO MAZAGON DOCKYARD, BOMBAY

F.G. (George) Satterthwaite, CAPT, USNR (Ret.)

Often there are many interesting places an attaché wants to see in the host country, but sometimes the host government is not willing to grant permission for the visit. Sometimes it is a matter of equity. Sometimes permission is not granted because the host has a memorandum of understanding with another country to forbid others to see mutual development projects. At other times the host just considers the places to be visited too sensitive to allow foreigners to see what they are up to.[1] At still other times denial of permission to visit is due to a "we've never done that before, so why let someone do it now" syndrome. The story related here is an example of that kind of response.

During my tour as DATT in Lima, I struck up a friendship with the Commander of the Peruvian Submarine Force. He had just returned from Germany where he had been the Defense and Naval Attaché. He understood the value of promoting good will with others by permitting foreign attachés to observe military operations of a training nature. He knew his attaché in Washington had been taken aboard U.S. nuclear submarines, and had visited the National Training Center at Fort Irwin. He wanted to reciprocate and offered me an eight-hour training ride on one of the Peruvian submarines. He made this offer on the spur of the moment without checking with his Director of Naval Intelligence. He probably thought, as I did, that because Peru has U.S. submarines, allowing a U.S. Naval Attaché on a U.S.-produced submarine would not be a violation of their security rules. The Admiral's offer was made in the weeks just before tensions between Peru and Ecuador heated up, during the summer of 1998. When I called to find out when the trip was scheduled, the Admiral's aide said that all the subs were on alert and he didn't know when the next training ride would take place. This was a totally expected and reasonable response given the operational situation.

---

[1] Defense Attaché officers are bound by the "Vienna Convention on Diplomatic Relations and Optional Protocols[,] Done at Vienna [Austria] on 18 April 1961, U.N.T.S. Nos. 7310-7312, vol. 500, 95-239 (see copy at URL: *http://www.fletcher.tufts.edu/multi/texts/BH408.txt*). These guidelines allow for accredited embassy officials, including military attachés, to engage in "ascertaining by all lawful means conditions and developments in the receiving State, and reporting thereon to the Government of the sending State (Article 3), and provide for freedom of movement except in specifically denied areas (Article 26). For a thorough overview of the "Defense Attaché System," see the Defense Intelligence Agency's *Communique* 12, no. 5 (September/October 2000).

As soon as the hostilities were brought to a peaceful conclusion on 26 November 1998, I tried to find another date for the promised submarine ride. The Admiral's aide told me they were trying to find a time and he would get back to me soon. He kept putting me off. As my tour wound down and my relief came to Lima for an orientation to the environment and to the job, I planned a reception and invited the Submarine Commander, among others whom my relief would need to know after he relieved me. The Admiral told me at that time that the visit was a "go," and that it would happen in the final week of my tour. During the last week of my tour the Foreign Liaison Officer took me out to lunch and he told me that the Director of Naval Intelligence (DNI) had countermanded the submarine Admiral's kind offer to let me ride on a Peruvian submarine. The reason given was it

would be counter to the national security interests of Peru. The Admiral was totally embarrassed as was the Foreign Liaison Officer, and the Peruvian Navy did not get to show the flag to a friend. The idea of reciprocity did not seem to enter the DNI's mind. Building a good service-to-service relationship moves ahead when friendly attachés are allowed to see how the host services train and operate.

How does an attaché allay either national security concerns or wrong thinking on the part of host-country foreign intelligence officials? In my experience, it is useful to take advantage of visits by "high rollers" to the country. A high roller is a flag or equivalent-level civilian who comes either invited by the host or self-invited by the U.S. Government. Generally, combatant command commanders self-invite themselves once every year or so to the countries in their Area of Responsibility. Fleet commanders of forward-deployed ships also like to visit countries in their operations area that have ports or navies. Self-invited visits generally result in gaining access to military units, which the attaché may have had difficulty visiting on his own. Superior to the self-invited visit is the visit sponsored by the host. Counterpart visits by chiefs of service fall under this heading. Here the host country is usually trying to put a best foot forward to impress the visitor with the capabilities of the host military and may be more amenable to showing off new capabilities and units.

Because the attaché is in a position to recommend an itinerary in both the invited and self-invited visits to the invitee as well as the host, he or she can influence the visit by recommending interesting places for that visitor to see. The only times I was able to see India's Mazagon Dockyard was when the U.S. Chief of Naval Operations (CNO) visited on two different occasions (host-invited visits), and when the staff of the Senate Select Committee on Intelligence (on a self-invited visit) traveled to India to investigate high-tech developments there. The Government of India accepted both of the CNO visits to the dockyard to see submarine developments as natural requests, because both CNOs were submarine officers (ADM Trost and ADM Kelso). I accompanied both CNOs on these visits and had a firsthand look at the Indian Navy's first submarine construction project. There were no repercussions in making these two visits. In fact, the Indian Navy asked me afterward what the CNO thought about their capability to build submarines. They were looking for acceptance as a modern and capable navy from the chief of the world's most modern navy. It was the self-invited visit by the Senate Select Committee on Intelligence staff to Mazagon Dockyard that gave me heartburn.

Several months before the Gulf War it was announced during the embassy's country team meeting that three members of the staff of the Senate Select Committee on Intelligence planned to visit India to see firsthand evidence of India's shipbuilding, aircraft building, atomic research, and space research programs. The staff members were senior U.S. Government employees, at least one of whom was a senior executive civil service or, in military terms, a flag-level visitor. Typically in U.S. embassies around the world, visits by congressional members or staff are under the auspices of the Political Section. This was the case for the Senate Select Committee Staff visit. A control officer from the Political Section was assigned the task of coordinating the visit. His job was to find out what the Staff wanted to accomplish in India, and then present a proposed program agenda to

the Foreign Ministry expressing the desires of the self-invitees. After informal acceptance of the proposal, the control officer drafted a diplomatic note and passed it around the embassy for coordination. It was at this point that I learned the visitors would be traveling to Bombay to see the Mazagon Dockyard and Bhaba Atomic Research Laboratory. From Bombay they would travel to the South India version of Silicon Valley at Bangalore, and visit Hindustan Aeronautics Ltd, and the Indian Space Research Organization (ISRO).

Author talks with an Indian Navy captain on board a third-party vessel.
This and other photos courtesy of the author.

I called on the control officer and found he was not overly excited about his responsibilities. He didn't want to travel with the visitors and complained of having too many other responsibilities. Also, the Department of State budget was very tight that year, and the Political Counselor didn't know where the money for travel was going to come from. I immediately interpreted the control officer's protests as a plea to pass the baton of handling this group to someone else. I told him I would be more than happy to take the burden from him. My boss and his agreed to the switch, and I drafted a change to the diplomatic note indicating I would be the new control officer. I did not realize at that time that to propose something to the Indian Foreign Ministry that was a little different from their expectations would make them attribute suspicious intentions to me. I'm sure the old India hands in the embassy, like the Deputy Chief of Mission, had experience with the mindset of Indian bureaucrats, but they did not advise me about the potential for Indian xenophobia to be translated into casting a pall over my bona fides.

I went about coordinating the visit by contacting the visitors and making arrangements for their travel and transportation within India. They arrived in country a week later and

we consolidated the plans for the trip to Bombay and Bangalore. Early on a Monday morning we departed from Indira Ghandi International Airport on an Indian Airlines flight to Bombay. Until this point everything was going as planned. Upon arrival in Bombay we hired a cab and took the 25-kilometer ride to the Taj Intercontinental Hotel, past the two million people in the city's slums and over the series of interconnected islands that make up Greater Bombay. We checked into the very posh Taj Intercontinental Hotel, which overlooks the Gateway to India, a memorial to the visit of King George V completed early in the 20th century. I asked for my usual room on the 14th floor, because besides overlooking the *Gateway of India*, it has a panoramic view of Bombay harbor. Fortunately, the room was vacant, and it was assigned to me. After checking in and unloading my suitcase, I peered out the window to see what there was to see in the harbor.

I always looked forward to trips to Bombay because my favorite restaurant there was the Nanking. It was a Chinese restaurant specializing in seafood dishes at very reasonable prices. It was on the ground floor in the same building as the Royal Bombay Yacht Club, and it was only a short walk from the hotel. Their crab with lobster sauce was especially delicious.

The Gateway to India and naval facilities in Bombay.

Author and son visiting with a Hindu holyman at a curio shop in Bombay.

The service in the Nanking was superb. My meal of crab with lobster sauce lived up to expectations, and after a cup of green tea I left the restaurant.

Later that day we visited the Bhaba Atomic Research Center located about mid-way between the hotel and Mazagon Dockyard. We were given the regular visiting-fireman type of tour. We did not observe any advanced research projects, but we did see a reactor used for medical isotope development and were given a watered-down briefing covering the entire research program. Even though we weren't shown the whole nine yards, so to speak, the staffers were impressed at the level of technical sophistication and knowledge of the researchers at the lab. Because their mission was to gauge overall technical competence and not specific programs, the visit to the Bhaba Atomic Research Center was successful.

The next morning we were escorted to the Dockyard, and got a windshield tour of the production facilities by company car. We also saw the work in progress on Soviet-designed destroyers and fast patrol boats. Modular construction of the destroyer was very impressive, and we were also given a status report on the production schedule. Submarine construction was left off the tour, but the chief executive officer of all the Indian-owned shipyards briefed us. He told us of the highlights and shortcomings of the entire Indian shipbuilding industry (military and commercial). All in all, the entire visit to Bombay was more than I had hoped for. One more night in teeming Bombay and we would be off to Bangalore in the morning.

We took the morning Indian Airlines flight to Bangalore, aboard an Airbus 320, of the same type that had crashed a year or so earlier due to a faulty fly-by-wire system. We were fortunate this time. The plane was on time and the flight uneventful.

Bangalore is a much less hectic city than Bombay. It also is populated with a large middle class of educated professionals. Unlike Bombay with some very rich and millions of poverty-stricken citizens, Bangalore is more homogeneous in terms of the standard of living. It is also the hub of technical innovation in India. Many computer firms, to include Hindustan Aeronautics Ltd. and the Indian Space Research Organization (ISRO) are the main centers of technology there. Because of the high density of well-educated and sophisticated people in Bangalore, one finds more Western style retail business establishments there as well. Many of the professional class were educated in the UK or the U.S. and have acquired tastes for Western food and clothing. The *sari* is still commonly worn; hence adoption of Western clothing style is limited to the male population. Bangalore is located in Karnataka State in South India and the local language is Kanada. Kanada, like other South Indian languages, is very different in sound, vocabulary and grammar from the interrelated languages of the North (Hindi, Punjabi, Marathi, Bengali, Bihari, and the like). Hindi speakers cannot understand Kanada speakers and vice versa, so communication between them is usually in English.

We checked into the Taj West End hotel, a member of the same chain as the Taj Intercontinental in Bombay and Taj Village in Goa. It is a one-story series of motel-like suites, and the layout and amenities have a Southern California look about them. We had nothing official on the agenda this day, so we lounged around the pool that afternoon and shared sea stories.

After a breakfast of very strong coffee, *somvar* and *idli* (spicy chutney and mushy rice), a traditional South Indian dish, we met our car and driver which had been prearranged by the Ministry of External Affairs (Foreign Ministry), and headed off to ISRO and Hindustan Aeronautics Ltd.

Our visit to ISRO was interesting. The Indian Government has a very sophisticated research program directed at putting satellites in stationary orbit above India. We learned, for example, that they had the capability to locate areas in India where ground water was prevalent and also where the vegetation was rapidly dying. This information, if used properly, could support the management of scarce potable water and forest resources. The Indian mindset, however, appeared to be focused on the technology itself and not on solving critical environmental problems. There was no effort to integrate the technology with the problems of the Home Ministry (Interior Ministry). It seemed that the Indians felt a lot of pride about being a member of the club of nations who have the ability to develop very sophisticated technology.

Next we visited Hindustan Aeronautics Ltd. (HAL). During WW II the predecessor to HAL had been a facility built by the U.S. to repair and assemble aircraft, which were being used in the China-Burma-India Theater of the war. After the war the Indian Govern-

ment took it over and converted the facility to an aircraft production facility. At the time of our visit they were building or conducting concept design on British Tornadoes under license from the UK, small Bell-type helicopters of indigenous design, and a new light combat aircraft, also of indigenous design. We toured the plant and were given a short briefing on future plans. I was especially interested in HAL because it was there that the LM 2500 General Electric gas turbine engines would be fabricated under license to be installed in the Indian Taruntul seagoing patrol craft. East would meet West in India when the U.S. LM2500 would power the Soviet-designed Taruntul! That project was mentioned in the brief, but the international agreements had not yet been signed so no production activity had been started. After a luncheon with the public affairs folks at HAL we departed for the airport for a flight back to New Delhi.

From my point of view spending DAO travel funds on this trip was a good investment. I was able to visit places by piggy-backing or "strap-hanging" on the visit of the Senate staffers—places that I would unlikely have been able to visit on my own, except perhaps for HAL. After the staffers departed, I busily documented the trip and fired off the resulting report to headquarters. About one week later the real fun began. I was looking forward to the next project, wondering what could top the trip to Bombay and Bangalore, when I was called into the Deputy Chief of Mission (DCM's) office. The DCM told me that the Joint Secretary for the Americas Division of the Ministry of Foreign Affairs had formally requested that I meet with him to explain my role in the Bombay and Bangalore trip. I asked what this was all about, and the DCM said he didn't have a clue. The change to the diplomatic note spelled out my role in the visit, and since the Government of India had approved the visit, he could not figure out why such a high-ranking official would summon me to his office. A Joint Secretary is equivalent in rank to an Assistant Secretary of State. The incumbent was in charge of international relations with Mexico, Canada, and the U.S. He had formerly served as the minister counselor (similar to a DCM) in the Indian Embassy in Washington and presumably knew how the U.S. Government was organized and operated. I had met him briefly at a fourth of July party, so I was not walking in on a complete stranger. My recollection was that he thoroughly enjoyed his tour in Washington, and his family was eager to return. I made an appointment to see the Joint Secretary the following week.

There is life after naval service in India.

On the appointed day I took the route to the foreign ministry that passes by all the apartments set aside for members of Parliament. Since Parliament was in session, there was much activity in the area. Clothes just washed were being hung out to dry and some Parliamentarians dressed in *dhotis* were gathered outside their apartments having morning *chai*. The Foreign Ministry was located in South Block, as was Naval Headquarters and the Ministry of Defense, except that the entry to the Foreign Ministry was on the opposite side of the fortress-like building from the Navy entrance. Upon entering, guests were asked to sign in and show their carnet (diplomatic I.D.), and then asked to wait in a musty but elegant anteroom until their point of contact could be reached. After about fifteen minutes, and still puzzled by the purpose of the summons, I was escorted to the Joint Secretary's office.

After a few introductory remarks about the cold winter weather in New Delhi and a cup of *chai*, I was bluntly asked why I was doing the work of the CIA, whose task it was to handle visitors from the U.S. National Foreign Intelligence Community? I retorted that Senate staffers are not from the Intelligence Community. They only conduct oversight with respect to the Community. In addition, the staffers mainly wanted to visit military production facilities here in India, and the military was definitely the bailiwick of the DAO. The Joint Secretary said, "Yes, I know how it works in Washington, but how do I answer the Parliament, whose members will presume you work for the CIA?" "Tell the truth," I said. He retorted, without further explanation, that this would put him in a very difficult position. I explained that what I did was a natural and reasonable thing to do given my responsibilities as a military attaché. I wondered at that point if I was going to

be expelled from India because of the Parliament's perception that I was doing something inconsistent with my diplomatic status as a military attaché. I kept thinking to myself, "How can we be having this conversation, when they (the Government of India) officially and in writing gave us permission to make the trip? This question could have been raised before the official notification of approval, and the Joint Secretary would not be in this 'difficult position.'"

Author with makeshift head covering for visiting a Hindu temple.

The issue was not resolved during the meeting. I suppose the Joint Secretary was reacting to questions from Parliament members, and had to go through the motions of calling me in and upbraiding me. I chalked it up to some communist sympathizer either in the Foreign or Defense Ministry who probably put the idea of my not being a "real" attaché into the bonnet of some receptive and Soviet-sympathizing Parliamentarian.

The price I paid for visiting some high-tech centers in India was that I was painted with a brush of suspicion. In my mind it was worth the embarrassment of being chewed out by the foreign ministry. I was not declared *persona non grata* and did not have to uproot my family. The U.S. Government was not embarrassed by the episode. We had followed the prescribed process of submitting a diplomatic note covering the trip and therefore the Government of India could only give me a verbal demarche instead of expulsion. The experience enlightened me about the complexity of Indian attitudes toward American diplomats. At one level it was all right to let U.S. officials see their facilities because of the Indian enjoyment of being thought of as avant-garde

or modern. At another there was still the lingering animosity and suspicion of Westerners promoted by the long-standing competition for the "hearts and minds" of the Indians by the U.S. and USSR. It would take some time to undo the effects of the Cold War that was waged hotly in the Third World.

ABOUT THE AUTHOR

Stephen Marrin is a graduate student specializing in intelligence studies at the University of Virginia, and he developed the ideas for this paper as part of his Master's thesis assessing the impact of the CIA's Kent School on analytic quality. He has also participated in CIA's analytic process in three different capacities: in 1996 and 1997 as a leadership analyst for CIA's Office of Near East, South Asia, and Africa; in 1998 as a project assistant for a group in the Office of Transnational Issues; and in 1999 and 2000 as a team leader for a contractor supplying analytical support to the Office of Transnational Issues. As required, this paper has been reviewed by CIA's Publication Review Board, which has no security objection to its dissemination. Their review does not confirm the accuracy of the information nor does it endorse the author's views.

IMPROVING CIA ANALYSIS BY OVERCOMING INSTITUTIONAL OBSTACLES

Stephen Marrin

The accuracy of CIA intelligence analysis depends in part upon an individual analyst's expertise, yet programs implemented to increase this expertise may not be sufficient to increase the accuracy of either an individual's analysis or the institution's output as a whole. Improving analytic accuracy by increasing the expertise of the analyst is not easy to achieve. Even if expertise development programs were to result in greater regional expertise, language capability, or an improved application of methodological tools, the production process itself still takes place within an institutional context that sets parameters for this expertise. The agency's bureaucratic processes and structure can impede an analyst's acquisition and application of additional expertise, preventing the full realization of the potential inherent in expertise development programs. Therefore, any new reform or program intended to improve analytic accuracy by increasing the expertise of its analysts should be supplemented with complementary reforms to bureaucratic processes — and perhaps even organizational structure — so as to increase the likelihood that individual or institutional improvement will occur.

The interplay between analyst and institution within the Intelligence Community remains poorly studied. As Columbia University's Robert Jervis has observed, "perhaps the intelligence community has paid too [little attention] ...to how the community's internal structure and norms might be altered to enable intelligence to be worth listening to."[1] CIA's intelligence production may be subject to improvement, but making that a reality requires a sophisticated understanding of how an analyst operates within the Directorate for Intelligence's [DI's] institutional context. However, empirical verification of this hypothesis is impossible since, as Jervis notes, "[r]igorous measures of the quality of intelligence are lacking" and are insurmountably difficult to create.[2] Under these circumstances, this essay is a conceptual "what-if" exploration into the interplay between the acquisition and application of expertise on three levels: that of the individual, bureaucratic processes, and organizational structure.

THE GOAL: IMPROVING CIA'S ANALYSIS

Improving the accuracy of CIA's finished intelligence products could make an immediate and direct improvement to national security policymaking as well as reduce the frequency and severity of intelligence failures. The CIA's DI—like other intelligence

[2] Jervis, 30

agencies — ideally provides policymakers with "timely, accurate, and objective" finished intelligence analysis tailored to the needs of the national security policymaker.[3] In the author's experience and observation, a DI analyst interprets the international environment through an information-processing methodology approximating the scientific method to convert raw intelligence data into finished analysis. The traditional "intelligence cycle" describes how an analyst integrates information collected by numerous entities and disseminates this information to policymakers. As William Colby—former Director of Central Intelligence (DCI) and veteran operations officer — notes, "at the center of the intelligence machine lies the analyst, and he is the fellow to whom all the information goes so that he can review it and think about it and determine what it means.[4] Although this model depicts the process in sequential terms, more accurately the analyst is engaged in never-ending conversations with collectors and policymakers over the status of international events and their implications for U.S. policy. As part of this process, intelligence analysts "take the usually fragmentary and inconclusive evidence gathered by the collectors and processors, study it, and write it up in short reports or long studies that meaningfully synthesize and interpret the findings," according to intelligence scholar Loch Johnson.[5]

Intelligence failures of every stripe from the trivial to the vitally important occur every day for a variety of reasons, including the mis-prioritization of collection systems, hasty analysis, and inappropriately applied assumptions. In the mid-1970s Richard Betts effectively settled the academic question of causes of failure by arguing that intelligence failures will be inevitable due to many inherent limitations in the analytic process.[6] Administrators at the Joint Military Intelligence College note that "analysis is subject to many pitfalls — biases, stereotypes, mirror-imaging, simplistic thinking, confusion between cause and effect, bureaucratic politics, group-think, and a host of other human failings."[7] Yet most intelligence failures do not lead to direct negative consequences for the U.S. primarily because the stakes of everyday policymaking are not high, and errors in fact and interpretation can be corrected as the iterative process between intelligence

and policy develops. As a result, most failures or inaccuracies are eventually corrected and usually never even noticed. However, sometimes intelligence failure is accompanied by either great policymaker surprise or serious negative consequences for U.S. national security, or both.

The CIA's May 1998 failure to warn American policymakers of India's intentions to test nuclear weapons is an illustration of both kinds of failure. This lapse — widely criticized by foreign policy experts and the press — highlighted intelligence limitations such as the DI's inability to add together all indications of a possible nuclear test and warn top policymakers. According to New York Times correspondent Tim Weiner, these indicators included "the announced intentions of the new Hindu nationalist government to make nuclear weapons part of its arsenal, the published pronouncements of India's atomic weapons commissioner, who said...that he was ready to test if political leaders gave the go-ahead, and ...missile tests by Pakistan that all but dared New Delhi to respond."[8] CIA's inability to integrate these indicators — a failure of analysis — led to charges of "lack of critical thinking and analytic rigor."[9] Admiral David Jeremiah—who headed the official investigation into the failure—concluded that intelligence failed to provide warning in part because analysts "had a mindset that said everybody else is going to work like we work," otherwise known as mirror-imaging.[10] He then "recommended hiring more analysts, improving their training and increasing contact with outside experts to challenge conventional wisdom," according to The Wall Street Journal's Carla Robbins.[11]

CIA's search for ways to improve analytic accuracy and prevent intelligence failure—if successful—could have a positive impact on national security policymaking. The CIA is arguably the centerpiece of the United States' fourteen-agency intelligence community (IC) and "has primary responsibility for all-source intelligence analysis in the [IC] and the preparation of finished national intelligence for the President and his top policymakers," according to former CIA Inspector General Fred Hitz.[12] If CIA analysis does have this kind of central role in influencing policy, improving its accuracy should provide policymakers with the opportunity to create or implement policies that more effectively protect national security and advance national interests.

THE METHOD: INCREASING ANALYTIC EXPERTISE

Improving the capabilities and knowledge of the individual CIA analyst through programs reflecting Admiral Jeremiah's recommendation, is one way to improve the accuracy of intelligence analysis. An analyst's expertise, defined as "the skill of an expert," [13] is a crucial component for the production of accurate intelligence analysis. "In the lexicon of US intelligence professionals, 'analysis' refers to the interpretation by experts of unevaluated ['raw'] information collected by the [IC]," according to Loch Johnson.[14] The presumption is the more "expert" an analyst is the more accurate the resulting interpretation will be. In May 2000, DCI George Tenet described the importance of an analyst's expertise in this manner:

> In our [DI] it is not enough just to make the right call. That takes luck. You have to make the right call for the right reasons. That takes expertise. It is expertise—built up through study and experience—that combines with relevance and rigor to produce something that is very important: insight....[O]ur analysts blend a scholar's mastery of detail with a reporter's sense of urgency and clarity. At its best, the result is insight. And it is insight that wins the confidence of our customers and makes them want to read our publications and listen to our briefings."[15]

Analytic expertise is a multi-faceted concept because CIA uses a complex web of analytic specialties to produce multi-disciplinary analysis. Not hired directly by the CIA or even the DI, most analysts are hired by the individual DI offices and assigned to "groups" that cover specific geographic areas, and are then assigned a functional specialty—"discipline" or "occupation" in DI terminology—such as political, military, economic, leadership, or scientific, technical, and weapons intelligence, according to CIA's website.[16] An analyst's expertise can vary depending on his or her relative degree of regional knowledge, familiarity with disciplinary theory, and with intelligence methods in general:

- Regional expertise is essentially area studies: a combination of the geography, history, sociology, and political structures of a defined geographic region. The DI's regional offices are responsible for an analyst's regional expertise and develop it by providing access to language training, regional familiarization through university courses, or in-house seminars.

[16] On the CIA website, see "Intelligence Disciplines" at URL: *http://www.odci.gov/cia/di/work/disciplines.html*; also see on the CIA website, "Directorate of Intelligence Organizational Components, Council of Intelligence Occupations," URL: *http://www.cia.gov/cia/di/mission/cioc.html*, accessed October 2001.

- Disciplinary expertise relates to the theory and practice that underlies the individual analytic occupations. For example, economic, military, political and leadership analysis are built on a bed of theory derived from the academic disciplines of economics, military science, political science, and political psychology, respectively. Disciplinary expertise can be acquired through previous academic coursework, on-the-job experience, or supplementary training.

For the most part each CIA analyst possesses a very small area of direct responsibility defined by a combination of regional area and discipline as they work in country teams with analysts of other disciplines and interact with other regional or disciplinary specialists as the need arises. CIA's small analytic niches create specialists, but their specialties must be re-integrated in order to provide high-level policymakers with a bigger picture that is more accurate and balanced than that arising from the limited perspective or knowledge of the niche analyst. This process of re-integration—known as "coordination" in DI parlance—allows analysts of all kinds to weigh in with their niche expertise on pieces of finished intelligence before they are disseminated. According to CIA analyst Frank Watanabe: "We coordinate to ensure a corporate product and to bring the substantive expertise of others to bear."[17] Accordingly, the bureaucratic norm is for an analyst to make every effort to coordinate a draft with other analysts in related regional or disciplinary accounts prior to submitting the draft to management for editing and dissemination. As a result, whereas the expertise of the primary drafter of the piece usually has primary influence on the accuracy of the final piece, the coordination process exerts a strong influence as well.

Insufficient analytic expertise can cause inaccuracies in intelligence analysis. Robert Jervis points out that "a grav[e] danger lies in not having sufficient expertise about an area or a problem to detect and interpret important trends and developments. To make up for such deficiency, analysts tend to impose on the information the concepts, models, and beliefs that they have derived elsewhere."[18] In addition, in 1991 former DCI Stansfield Turner noted that "[a]nother reason for many of the analytic shortcomings is that our analytical agencies do not have an adequate grasp of the cultures of many countries with which we must deal."[19] Seven years later the CIA failed to provide policymakers with warning of India's nuclear tests for this very reason. To bolster CIA's weaknesses, in 1991 Turner suggested that analysts should be provided with "a better opportunity to attend academic institutions, participate in professional conferences, travel and live abroad, acquire language skills and thus become true experts in their areas."[20] Yet in

[20] Turner, 164.

1998 former CIA officer Robert Steele observed that "[t]he average analyst has 2 to 5 years' experience. They haven't been to the countries they're analyzing. They don't have the language, the historical knowledge, the in-country residence time or the respect of their private-sector peers," as reported by Tim Weiner.[21]

CIA has recently implemented programs to increase analytic expertise. In 2000, then-Deputy Director for Intelligence (DDI) and current Deputy Director of Central Intelligence (DDCI) John McLaughlin created the Sherman Kent School for Intelligence Analysis, which was "designed to give new employees a rigorous, 26-week overview of intelligence analysis" [22] as well as provide training in CIA's analytic disciplines to officers of all levels. In addition, McLaughlin said that CIA is "going all out to achieve greater analytic depth. We are providing incentives for analysts to stay on their accounts longer. We are affording our analysts greater opportunities to travel and to broaden their experience. Because we claim no monopoly on wisdom, we are bringing in outside experts for short tours as scholars-in-residence. We also are encouraging our analysts to expand their contacts with specialists elsewhere in government, in the private sector and in academia."[23]

Increasing expertise may not be sufficient to produce accuracy or prevent failure. As Jervis notes, "experts will [not] necessarily get the right answers. Indeed, the parochialism of those who know all the facts about a particular country that they consider to be unique, but lack the conceptual tools for making sense of much of what they see, is well known."[24] In addition, "[e]ven if the organizational problems...and perceptual impediments to accurate perception were remedied or removed, we could not expect an enormous increase in our ability to predict events" because "(t)he impediments to understanding our world are so great that... intelligence will often reach incorrect conclusions."[25] That is because human cognitive limitations require analysts to simplify reality through the analytic process, but reality simplified is no longer reality. As a result, "even experts can be wrong because their expertise is based on rules which are at best blunt approximations of reality. In the end any analytic judgment will be an approximation of the real world and therefore subject to some amount of error"[26] and analytic inaccuracies—and sometimes intelligence failure—will be

inevitable. Therefore, although increasing expertise is a goal, it cannot be the only goal for increasing DI capabilities.

Nevertheless, the DI leadership has created multiple expertise development initiatives to counter perceptions of analytic inadequacy and increase the DI's core capability — its analytic expertise. The unanswered question is whether the analyst can acquire and apply relevant expertise within the institutional constraints of the DI.

FIRST INTERVENING FACTOR: BUREAUCRATIC PROCESSES

Bureaucratic processes can impede the acquisition or application of expertise gained in expertise development programs, thereby limiting any potential improvement in overall analytic accuracy. The DI is a bureaucracy, and like every bureaucracy creates "standard operating procedures" (SOPs) which are necessary for efficient functioning but over time usually prove to be rigid in implementation.[27] As former DDI Doug MacEachin noted in 1994: "We have all been a part of what has been good and of what needs changing. Some of the practices needing change came into being as the unforeseen result of efforts undertaken for sound constructive reasons, judged by participants at the time to have been fully valid and usually aimed at correcting deficiencies of the time. But collectively, with time and bureaucratic evolution, they turned out to be counterproductive."[28] Some of the DI's SOPs prevent analysts from applying the tradecraft standards and other forms of expertise learned elsewhere. Jack Davis, a former DI officer and analytic methodologist, observed that "examples of what MacEachin would label as poorly substantiated analysis are still seen (after training). Clearly, ongoing vigilance is needed to keep such analysis from finding its way into DI products."[29] Such vigilance includes assessing the bureaucratic context for obstacles preventing tradecraft application.

Analysts must have the opportunity to apply newly acquired expertise back at their desks in the DI for any improvement to result. However, if analysts do not have the opportunity to apply this expertise, it will likely wither for lack of practice. The DI produces many types of finished intelligence — some reportorial, some analytical, and some estimative—to meet policymakers' varying needs for information. In addition to daily updates on developments worldwide, policymakers and their staffs also use information and analyses when crafting policy and monitoring its implementation. Obstacles to the development of expertise appear when shorter product types are emphasized over longer more

[27] If bureaucracies stultify good ideas by turning them into "standard operating procedures" regardless of situation — as Graham Allison's organizational process model in his *Essence of Decision* implies — then a bureaucracy is forever in a state of flux, somewhere along the pendulum from one bureaucratized extreme to the other.

research-oriented ones. Short turnaround products—including daily updates known as "current" intelligence — have at times been emphasized over other products for their greater relevancy to policymakers, but this emphasis at the same time has reduced the expertise of the DI writ large because they require different kinds of mental operations that reduce the scope and scale of an analyst's research and knowledge. Robert Jervis once observed that "the informal norms and incentives of the intelligence community often form what Charles Perrow has called 'an error-inducing system.' That is, interlocking and supporting habits of the community systematically decrease the likelihood that careful and penetrating intelligence analyses will be produced and therefore make errors extremely likely."[30] Bureaucratic processes can contribute to the creation of this kind of "error-inducing system."

The Swinging Pendulum

For much of the DI's history, analysts acquired expertise by writing long reports. As former CIA officer Arthur Hulnick notes: "a great deal of research was being done, but ...much of it was done to enable the analyst to speak authoritatively on a current issue, rather than for publication."[31] Loch Johnson agrees, saying that "[t]he preparation of longer reports...is important, too, as ... a vital learning experience for analysts."[32] He adds that "[I]ntellectually most satisfying to the intelligence analyst is the full-blown research project, for it allows more room for the tracing of nuances. ... Under the Reagan administration, the [DI] established a research program...[in which] each of the ten [DI] offices...was told to redouble its efforts to produce solid research papers. In one nine-month period, more than 900 such reports were in progress... .[A]s Gates has claimed, 'the CIA is the only place where long-range research on national security issues is being done—two, five, ten, twenty years down the road. The Department of State Planning Staff conducts this kind of research only sporadically.'"[33]

By the early 1990s, however, long papers had become bureaucratized. In a 1993 article, former analyst Jay Young argued that "the needs of the policy-maker too often get lost in the time-consuming, self-absorbed and corrosive intelligence research production process. The DI's research program is run with the same rigid attention to production quotas as any five-year plan in the old USSR. ... This fixation on numerical production leads managers to keep analysts working away on papers whose relevance may be increasingly questionable. ... In short, too much of the Agency's longer-term research is untimely, on subjects of marginal importance and chock-full of fuzzy judgments." [34] He went on to

[30] Jervis, 34.

advocate a reduction in the number of long papers published each year. In short, although longer papers helped develop analytic expertise, bureaucratic tendencies had made their production increasingly irrelevant to policymakers.

In response to such criticisms, DI managers dictated that relevancy required shorter papers. In 1994, then-DDI Doug MacEachin limited "most DI analytical papers ... to 3 to 7 pages, including graphics and illustrations."[35] Shorter reports made the DI's analytical output more useful for policymakers, but analysts acquired less expertise on each topic. As a result, while the papers were more targeted, they contained fewer insights for the policymaker. Predictably, complaints then arose that the DI lacked the expertise necessary to do quality analysis. According to former DI analyst John Gentry in 1995:

> For reasons that heavily reflect its changing internal culture, CIA has begun to think much more myopically. It even claims now that it is emphasizing ''tactical'' projects and largely eliminated ''strategic'' work. In the DI, these terms are new ones for what formerly were ''current intelligence'' and ''research,'' respectively... The change is major and is formal policy...In other words, CIA has given up its former mission of trying to develop the analytic expertise and the information assets to forecast another Pearl Harbor in favor of collecting information to serve the analytic priority of drafting the short, pithy pieces for the National Intelligence Daily (NID) and other current intelligence publications...This change is enormous — and it is enormously irresponsible. ...[T]he failure to devote resources to long-term collection and to the development and maintenance of analytical expertise risks major surprises — and major intelligence failures — in the future.[36]

By 1997, DI management had admitted that the pendulum had swung too far and they were making efforts to address the decreased level of expertise. In 1997, then-DDI John McLaughlin noted that the DI's recent "impressive record of supporting the current intelligence needs of senior policymakers" made "an enormous claim on our personnel and resources" and the DI was "trying to balance the need for current support against the need to look ahead."[37] Since then the DI has emphasized acquisition of expertise, and funded opportunities for analysts to gain it by arguing that "[a]nother priority for intelligence analysis is to deliver a product that adds context and meaning to the raw intelligence. ...

One of the ways to stay relevant is to build and maintain subject matter expertise, continuity, and depth within the analytical ranks."[38]

Losing Expertise to Gain Relevance

The swing of the pendulum that emphasizes policymaker relevance over analytic depth causes the DI to produce a large amount of current intelligence that prevents the acquisition and application of analytic expertise. Many analysts are facile data interpreters able to integrate large volumes of new information with existing knowledge, and interpret—based on underlying conceptual constructs — the significance of the new data in terms of its implications for U.S. foreign policymaking. This process provides policymakers with exactly what they are looking for from intelligence analysis. However, if provided with minimal time in which to integrate and process the information, the intelligence analyst by necessity cuts corners. When the DI emphasizes intelligence "on-demand," analysts meet the much shorter deadlines by reducing the scope and scale of their research as well as sidestepping the more laborious tradecraft procedures by not rigorously scrutinizing assumptions or comparing working hypotheses to competing explanations. Many times current intelligence analysis consists of a single hypothesis — derived within the first hour of the tasking — that the analyst intuitively believes provides the best explanation for the data. Current intelligence as a product has a lesser chance of being accurate because it lacks the self-conscious rigor that tradecraft entails even though it is the best that can be done under the press of quick deadlines.

The production of a single piece of current intelligence has limited effect on expertise because it draws on the knowledge and tools that an analyst has developed through training and prior analysis. However, if over time the analyst does not have the time to think, learn, or integrate new information with old to create new understandings, knowledge of facts and events may increase but the ability to interpret these events accurately decreases.

In a production environment attuned to the policymaker's current need for information, analysts will fail to apply the newly acquired expertise and instead will fall back to providing intuitive rather than structured analysis. Intelligence scholar Robert Folker observed that in his interviews of intelligence analysts a "repeated complaint was the analyst's lack of time to devote to thoughtful intelligence analysis. In a separate interview at CIA it was revealed that [intelligence analysts]... spend little time or effort conducting analysis."[39] Therefore, the effectiveness of expertise development programs in improving analytic accuracy may depend in part on whether the CIA is able to redress the overemphasis on short-term analysis. Balancing the swinging pendulum is easier to recom-

[38] McLaughlin, 18.

[39] Robert D. Folker, *Intelligence Analysis in Theater Joint Intelligence Centers: An Experiment in Applying Structured Methods*, Occasional Paper Number Seven (Washington, DC: Joint Military Intelligence College, January 2000), 12.

mend than to do since production of both extremes—long-term research and current intelligence support—may be necessary.

A Structural Fix?

If the DI remains true to form, at some time in the future the pendulum will swing too far toward knowledge-creation, papers will become longer and less relevant to policymakers. Perhaps there is a way to diagnose more accurately the cause of this swing and find a middle-ground that balances the trade-offs. The answer, however, does not lie in directives from the top that emphasize the utility or desirableness of one product type over another. These will likely just be encapsulated into the DI's SOPs and move the pendulum too far in the opposite direction. Instead, if CIA were to bifurcate its intelligence production system to specialize both in long-term research and current intelligence support, it would side-step the trade-offs between timeliness and accuracy that ultimately cause the pendulum to swing, and make the best use of any expertise-development program. Underlying this suggestion is a more strategic and nuanced approach to human resources management than CIA currently uses.

Just as there are different kinds of intelligence products requiring different levels of analytic ability, individual analysts possess varying cognitive strengths and weaknesses. As a senior DI analyst noted in an internal computer discussion in 1997, there may be two types of cognitive preferences — not "mutually exclusive"—that differentiate one kind of analyst from another: "Some people are better at...a broad range of issues, areas, and disciplines. These make the best current intelligence analysts because they generally are quick to learn an account. ... In simple terms, these are the people who are good at crafting a coherent story from a jumble of seemingly disconnected parts. ... Becoming an expert at this kind of analysis requires a great deal of experience. ... An expert of this type needs to continuously cast a net over a greater range of evidence and then relate it." He then goes on to add that it is better if this kind of analyst has experience on multiple accounts. Then he contrasts this expert generalist to "the other type of expert analyst...who concentrates on learning as much as possible about their chosen subject, area, or discipline. These are our specialists. They do the basic research, build our corporate knowledge base, and concentrate on depth rather than breadth. In the old days in the DDI, managers used to call these analysts the investors. They put money in the bank account which the current intelligence analysts draw out to spend. ... University study, technical training, language proficiency, and several years on an account are a necessity for developing the type of analytical expertise we need for our specialists."[40]

The DI appears to be remarkably blind to differentiation in both analysis and analysts, perhaps because it assigns tasks to "analysts" and equates the output with "analysis." As a result, "[w]e do not and never have used the term 'analysis' rigorously in the [IC]" according to Robert Bovey, formerly a special assistant to a DCI.[41] Robert Jervis

[40] CIA officer, "Two Types of Expert Analyst," DI Discussion Database, 28 March 1997.

illustrated the problems of equating the two in 1988 by arguing that "most political analysis would better be described as political reporting" and that instead of following an analytical approach "the analyst is expected to summarize the recent reports from the field—"cable-gisting." ... [T]he reporting style is not analytical—there are few attempts to dig much beneath the surface of events, to look beyond the next few weeks, to consider alternative explanations for the events, or to carefully marshal evidence that could support alternative views."[42] Jervis correctly differentiated the analytical intelligence product from its non-analytic cousin, but failed to distinguish between the analysts best suited for each. The DI — instead of differentiating between analysts — uses a one-size-fits-all recruitment, placement, training, and promotion strategy, and for the most part views analysts as interchangeable. As a result it has perennially had difficulty creating an appropriate mix of analytic abilities and skills for intelligence production when an issue or crisis develops. In particular, over time the shift in expertise corresponding to a preference for longer papers or shorter more current pieces is especially noticeable.

An intelligence production system bifurcated by product type would likely eliminate many of the problems inherent in the current system. In the early 1950s CIA intelligence production was organized by product type. The Office of Research and Reports produced basic intelligence, the Office of National Estimates provided forward-looking estimates, and the Office of Current Intelligence "produce[d] the President's daily intelligence publication," [43] according to the Agency's website. Resurrecting an Office of Current Intelligence to handle immediate requests and an Office of Research and Reports to do longer-term analytic papers could provide a self-selection mechanism useful for targeting an individual's cognitive strengths at the policymakers' intelligence needs. This structure would not promote the loss of expertise because different kinds of expertise would be applied to appropriate product types. However, this organizational structure would also require trade-offs-examined below—that would reduce regional expertise on the margins at the same time as it would allow the experts to increase theirs.

SECOND INTERVENING FACTOR: ORGANIZATIONAL STRUCTURE

The DI's organizational structure also influences which kind of analyst expertise is acquired and applied in finished intelligence products. Political scientist Thomas Hammond argues that organizational structure impacts analytic output. He employs information-flow models to demonstrate that—given the same information—one group of intelligence analysts organized by discipline would produce different analytic output than another group organized by region. He also concludes that it is impossible to

[41] Robert Bovey, "The Quality of Intelligence Analysis." *American Intelligence Journal* 3, no. 4 (Winter 1980-81): 7.

[42] Jervis, 34-35.

[43] CIA website, "Key Events in DI History," URL: *http://www.cia.gov/cia/di/history/*, accessed October 2001.

design a structure that does not impact output.[44] If we accept his argument, then organizational structure always affects internal information flows, and likely outputs as well. Theoretically, therefore, an organizational structure divided along disciplinary lines will accentuate learning of political, economic, military, or leadership methodologies through constant, interactive contact and awareness of the projects of other analysts.

However, regional or country knowledge is sacrificed due to the lack of such contact. In an office structured along geographic lines, the emphasis will be reversed. The 1998 India intelligence failure provides a good illustration of how organization can affect expertise. Prior to the 1996 creation of the National Imagery and Mapping Agency, imagery analysts had been distributed, by affiliation at least, throughout the Intelligence Community.[45] According to former CIA analyst Melvin Goodman, "the consolidation of all analysis of satellite imagery in (NIMA)...contributed to the intelligence failure. By placing all analysis of imagery inside the Department of Defense...there would be a minimum of the critical cross-discipline analysis required for difficult regional problems such as the political and military frictions in South Asia."[46] This episode may be considered an illustration of how trade-offs in expertise inherent in organizational structure can affect the DI as well.

Over the past 50 years the DI has been structured by product type, by discipline, and by region. From approximately the early 1960s to 1981, the DI was structured primarily by discipline with political, economic, military, and leadership offices each subdivided by geography. In 1981 "(a) (DI)-wide reorganization...shuffled most analysts and created geographically based, or "regional" offices out of the previous organization."[47] According to former CIA officer Arthur Hulnick: "These [new] offices combined political, economic, military, and other kinds of research under "one roof," thus making more detailed analytic research feasible. After some grumbling, the new offices began to turn out the in-depth products consumers had been seeking, while still providing current intelligence materials."[48] This integration of analytic disciplines in regional offices provided a more productive interpretation of the forces at work within a target country or region but also negatively affected the DI's ability to maintain disciplinary knowledge.

The 1995 dismantling of the DI's Office of Leadership Analysis (LDA) provides a good case study into the trade-offs between disciplinary and regional expertise resulting from differing organizational arrangements.[49] Since at least 1963 the CIA has consolidated biographic information on foreign leaders, and over time the value of leadership analysis as a complement to political, economic, and military analysis became evident.[50]

Analysis grounded in the theory of political psychology provided insight into a leader's behavior above and beyond the limited biographic scope of a leadership profile.[51] LDA was thus created to develop and consolidate the discipline of leadership analysis and put it on a near-equal basis with the other established analytic disciplines. However, in 1994, then-DDI Doug MacEachin reorganized LDA — the only disciplinary office left — out of existence as part of "downsizing the DI."[52] Political factors may have played a part in this decision. The Clinton Administration's Haiti policy was greatly complicated by partisan opposition in the wake of a leaked leadership profile produced by LDA that questioned the psychological stability of Jean Bertrand Aristide.[53] In any case, LDA's elimination had an impact on the expertise of the DI's leadership analysts.

The regional offices swallowed LDA as its component units were assigned to the relevant regional office. Some regional offices kept leadership analysts together as a team so as to maintain the disciplinary knowledge developed in LDA. Other offices broke leadership teams apart and assigned individual analysts to join multi-disciplinary country teams. The distribution of what had previously been centralized knowledge of analytic tools, specialized product formats, and disciplinary theory throughout the DI meant that new leadership analysts were not well trained in their discipline. These new analysts relied solely on the fast-dissipating knowledge of the handful of former LDA officers who happened to be assigned to their team or issue. In addition, actual physical co-location did not occur for months — and in some cases years — due to lack of space in CIA's overcrowded headquarters building. As a result of being "out of sight, out of mind," leadership analysts were frequently not informed of ongoing projects, briefings, and meetings, and such incidents had a negative impact on the finished analytical product. When leadership analysts were not included in briefings, the DI risked failing to keep its consumers fully informed of both leadership dynamics and changes within the country or region. In addition, products published and disseminated without coordination at times contained factual errors such as the wrong names or positions for foreign government officials, or distortions in analysis due to the lack of leadership analyst input. However, once re-organization occurred, regional counterpart analysts became team members, and after a shaking-out period began to incorporate leadership analyst contributions into their products more easily. In fact, the close interaction with other members of the regional team led to a better incorporation of leadership analysis into regional products than had occurred during the heyday

[49] The information herein on LDA is derived from personal experience as a leadership analyst from 1996 to 1998.

of LDA. Therefore, the elimination of a leadership analysis-based office resulted in both increased incorporation of leadership analysis and insight into the regional teams' products, and decreased corporate knowledge and expertise in leadership analysis as a discipline. The same occurred for the other disciplines when their respective offices were eliminated in 1981.

PUTTING THE PIECES TOGETHER AGAIN

By the mid-1990s DI analysts were realizing that while multi-disciplinary analysis on country teams made for better integration of disciplines, it also led to the dissipation of disciplinary knowledge. Former LDA analysts' efforts to sustain their hold on disciplinary knowledge triggered similar efforts by political, economic and military analysts to both sustain and reconstruct occupational-specific knowledge. Without the framework of structural organization to bind each discipline together, over time they had each grown apart.

To rectify this loss of disciplinary expertise, in 1997 the DI created the "senior-level" Council of Intelligence Occupations (CIOC) with the initial intent of disciplinary "workforce strategic planning...in the areas of recruitment, assignments, and training" as well as "identify[ing] core skills and standards for expertise in the [DI]."[54] In practice, CIOC became a home for senior analysts interested in learning and teaching their discipline's methodologies. They "establish[ed] a professional development program for all DI employees that provides explicit proficiency criteria at each level so that everyone can see the knowledge, skills, and experiences required for advancement within each occupation or across occupations."[55] All this was done—according to the CIA website — "so that the DI has the expertise needed to provide value-added all-source analysis to its customers."[56] CIOC emphasized disciplinary training as a method to achieve this goal. As the CIA's website notes, "(t)he Council views learning and skills development as an essential part of work and the means whereby employees can respond to changes in customer priorities and the external environment."[57] In 2000, CIOC was disbanded although its training functions have been incorporated into the DI's Kent School and its other knowledge has been distributed elsewhere within the DI.

There may be no easy solution to the expertise trade-offs inherent in organizational structure. By definition, the structure will create synergies in the areas emphasized but the opportunity cost of doing so means losing the synergies in other areas. At bottom this

is a prioritization issue: the organizational structure should reflect the dynamic that the DI leadership believes will most directly benefit its policymaker consumers. Establishing secondary institutions like CIOC or disciplinary training through the Kent School to bolster the lost expertise may be the only way to preserve knowledge that otherwise would be lost.

TO THE FUTURE

Expertise-development programs that create the potential to improve overall analytic accuracy—such as formal training in methodologies, regions, disciplines, or languages, or informal training resulting from greater overseas experience—do not provide much in the way of improvement if in fact the DI's business practices prevent application of this hard-earned expertise. CIA's leaders should continue to pursue ways to increase analyst expertise, for they could contribute to increased analytic accuracy. Yet at the same time the DI must adapt its practices to leverage the potential improvements of these programs if the CIA is to provide its policymaking customers with the intelligence they need now and in the future. The creation of a bifurcated production process might remove an impediment preventing acquisition and application of expertise, but other reforms may be necessary as well.

The CIA was created in the wake of the Japanese attack on Pearl Harbor to coordinate and integrate intelligence information and provide strategic warning should any foe of the United States choose to attack. With respect to the September 2001 attacks on the U.S.—it is still too soon to determine whether the CIA's failure to provide specific warning lay in organizational inefficiencies, collection gaps, analytic missteps, or in some combination of the three. Regardless, improvements in intelligence analysis must occur so as to provide policymakers with warning of any potential future attacks while preventing surprises on issues of national security importance. Managing the DI so that it can produce accurate intelligence will require an accurate assessment of the DI's current capabilities, an understanding of its limitations, and creative approaches to overcome them. Current DI business practices entail tradeoffs that prevent full actualization of the DI's potential. Perhaps through serious study the constraints that the DI's working environment imposes on analytic expertise will be understood and overcome. As Robert Jervis declares, "(w)e will never be able to do as well as we would like, but this does not mean that we cannot do better than we are doing now."[58]

ABOUT THE AUTHOR

Lt Col Tom Garin, an Air Force officer assigned to the National Reconnaissance Office (NRO), arrived at the Joint Military Intelligence College in September 1999 to occupy the General Thomas S. Moorman, Jr. Chair for National Reconnaissance Systems. He has taught graduate-level core and elective courses on missiles and space systems, structured techniques for intelligence analysis, and research methodologies, as well as an undergraduate core course on space systems. Prior to this post, Lt Col Garin was Chief, Organizational Development at the NRO. There, he used a balanced scorecard approach to link human resource policies with the overall NRO mission. He also worked part-time for Vice President Gore's National Performance Review on a performance measurement benchmarking study team to help government agencies prepare for the Government Performance and Results Act. In addition, he completed special projects as directed by the Assistant Secretary of the Air Force for Space.

Lt Col Garin received a B.S. in Operations Research (OR) from the United States Air Force Academy in 1982, a M.S. in OR from the Air Force Institute of Technology in March 1990, and a Master of Public Administration from the University of Southern California (USC) in May 2001. He is currently in the Doctorate of Public Administration program at USC.

APPRAISING BEST PRACTICES IN DEFENSE INTELLIGENCE ANALYSIS

Thomas A. Garin, Lt Col, USAF

An adaptable organization is one that has the capacity for internal change in response to external conditions. To be adaptable, organizations must be able to learn. Organizations can learn by monitoring their environment, relating this information to internal norms, detecting any deviations from these norms, and correcting discrepancies. The National Foreign Intelligence Community at large learns by collecting necessary information, analyzing the information, and disseminating it to users who in turn hold the option to influence collection decisions. A telling aspect of any knowledge organization is the way in which it manages its information.

Knowledge management can equip intelligence organizations for the fast-paced, high-technology information age. By building upon the best aspects of total quality management, and observing the criteria for performance excellence adopted for the Baldrige National Quality Program, managers can theoretically lead professionals to work together effectively as a group in a situation in which their dealings with one another affect their common welfare. In this paper, Baldrige criteria guide an "insider's" exploration of how a set of senior intelligence officers of the Defense Intelligence Agency do intelligence analysis.[1]

STUDY DESIGN

The DIA is expected to ensure the satisfaction of the full range of foreign military and military-related intelligence requirements of defense organizations, UN Coalition Forces, and non-defense consumers, as appropriate. Specifically, DIA supports: (1) joint military operations in peacetime, crisis, contingency, and combat; (2) service weapons acquisition; and (3) defense policymaking. In the past fifteen years, several analysis and production units within DIA have received prestigious awards demonstrating the confidence and appreciation that senior U.S. leaders have in the agency's performance. On the basis of these observations, a case could be made that DIA has become a world-class organization for meeting U.S. military intelligence requirements. Clearly, the DIA is a worthy organization to examine for evidence of how quality intelligence analysis can be carried out.

---

[1] The three essential characteristics of operations research are (1) systems orientation, (2) use of interdisciplinary teams, and (3) adaptation of the scientific method. The Baldrige criteria provide a similar function for assessing information organizations. From a systems perspective, the Baldrige criteria focus on a leadership triad and a results triad. Activity by leadership affects results and the results, in turn, affect the future activity of leadership. From a team perspective, the Baldrige criteria focus on the multiple lens of leadership, the customers or consumers, and the analysts to gain a complete understanding of its operations. Lastly, the Baldrige criteria focus on information and analysis, emphasizing a fact-based, scientific approach, to serve as a foundation for the performance management system.

A Typical Office

A typical analysis office consists of a manager, the senior intelligence officer (SIO), analysts, liaison officers, and administration/technical support staff. The manager handles a set of processes common to many organizations such as planning, organizing, staffing, directing, coordinating, reporting, and budgeting. The SIO is a senior analyst, a subject matter expert on a grand scale, and is responsible for the content of the analytical product. A typical SIO approves all finished intelligence products, coordinates budget to contract external studies, and is the unit's chief training officer. Analysts tend to be subject matter experts and are accustomed to using technology to support analysis. Liaison officers connect the analysis office either to operational forces in the field or to other organizations in the Intelligence Community. The administration/technical support staff provide a variety of functions such as disseminating the finished intelligence product, providing graphic support, and arranging travel.

Consumer Groups

Analysts produce intelligence for a number of different consumer groups.[2] These consumer groups include: (1) civilian and military policymakers; (2) military planners and executors; (3) acquisition personnel responsible for force modernization; (4) diplomatic operators; and (5) intelligence operators. Consumer groups specific to DIA analysts include (1) DIA leadership such as the Director, DIA, and the Director of Intelligence (DI); (2) Pentagon senior leadership such as Generals on the Joint Staff, other Generals in the Pentagon, and senior civilians; and (3) senior leadership in the field such as the Combatant Commanders.

Participants

This intelligence analysis benchmarking study is the result of a class project for the Joint Military Intelligence College's graduate-level course ANA 635, "Structured Techniques for Intelligence Analysts." This course helps students understand and apply descriptive and quantitative methodologies to intelligence analysis. Students were from the U.S. Air Force, U.S. Army, U.S. Navy, National Reconnaissance Office, National Imagery and Mapping Agency, and Defense Intelligence Agency. The study team worked

---

[2] A useful distinction may be drawn between "consumers" and "customers" of intelligence. Customers are those who must "pay" for the intelligence service by providing liaison officers or participating in the intelligence process in a way that drains away part of their own organization's resources. Consumers are those who are entitled to receive either standard or tailored analytic products, including briefings, but who do not find it necessary to obligate any of their own resources to its production. DIA offices typically do not recognize this distinction, and individual analysts are known to scoff at the notion that anyone for whom they provide an analytic product is a "customer" because of a perception that those who use a product are "professionals" in a sense that transcends the representation of value in dollar terms.

with five analytic units within DIA that have demonstrated excellence. The SIOs and others who met with the research team had a combined total of over 100 years of experience in intelligence analysis or related areas.

Process

The team followed established benchmarking procedures in conducting this study, which included on-site visits and interviews with members of each unit. The study team adopted a "systems" perspective that isolated the concepts of leadership, strategic planning, consumer focus, information and analysis, people and resources, process management, and mission accomplishment. Taken together, these seven elements define an organization (or a unit within a larger organization), its operations, and its performance. The information and analysis category is especially critical to the effective management of an information organization like DIA.

Exemplary Intelligence Offices

Based on their experiences, members of the JMIC faculty recommended a number of offices in the Defense Intelligence Agency as suitable interview venues for this project. The students in a structured analytic techniques class chose a subset of the organizations based on their interest in the organization. The class size limited the number of organizations that could be included in the study. Also, once officials became aware of the project and the nature of the information required, certain offices deselected themselves from the project based on their estimated lack of ability to contribute in a meaningful way. Other organizations were not available to meet with us during our limited schedule, the last few weeks of the spring quarter.

The study team visited a total number of five analysis-related organizations. Three of the organizations reside in the Directorate for Intelligence (DI). The J-2 representative who was interviewed was from a fairly small office within a much larger J-2 analysis office. He had experience in other DIA analysis offices. The JMIC respondent represented a relatively small number of faculty members with past analysis experience. Of the three DI offices, the TWC is a relatively large analysis office. The OICC, on the other hand, is a relatively small analysis-related shop that draws from the analysts within the DI to meet its mission requirements in a crisis situation. Like the OICC, the OSJ-2 is a relatively small analysis shop.

1. **Directorate for Intelligence (J2):** JCS/J-2 provides indications and warning, crisis and current intelligence support to the Office of the Secretary of Defense (OSD), the Chairman of the Joint Chiefs of Staff (JCS), Joint Staff offices, and to the Unified Commands. The J2 represents intelligence requirements of the Unified Commands, writes joint intelligence doctrine, and directs intelligence, surveillance, and reconnaissance-based assessments for the Joint Requirements Oversight Council, and the Joint Staff Director-led Joint Warfighter Capabilities Assessment teams that perform detailed assessments of programmatic alternatives, tradeoffs, risks, and effectiveness.

2. **Joint Military Intelligence College (JMIC):** The College educates military and civilian intelligence professionals and conducts and disseminates intelligence-related research.

Directorate for Intelligence Production (DI): This division manages the production of military intelligence throughout the General Defense Intelligence Program. Its products respond to intelligence needs of the OSD, JCS, Unified Commands, military services, and other U.S. government agencies. Specifically, offices for which information is developed here are:

3. **Office for Counterterrorism Analysis (TWC):** Supports the Transnational Warfare Group's efforts to detect, characterize, and assess vulnerabilities of adversary capabilities for emergent counterterrorism opportunities. TWC manages and produces all-source-intelligence in support of warfighter, policy, and acquisition communities.

4. **Operational Intelligence Coordination Center (OICC):** Exists as the focal point for crisis and contingency intelligence production within the DI. In this capacity, the OICC operates around the clock and supports the timely production and dissemination of all-source intelligence for DIA's strategic, operational, and tactical-level consumers. This effort includes the management of all intelligence taskings, requests for information, and personnel augmentation requests.

5. **Operational Environment Analysis Division (OSJ-2):** Initiates, oversees, and coordinates all-source military geographic (terrain, cultural and demographic) intelligence analysis and production required to support crisis, operational, and contingency planning efforts of the National Command Authorities (Secretaries of Defense and State), the JCS, Unified Commands, and deployed forces.

THE EVALUATION CRITERIA

The Malcolm Baldrige National Quality Improvement Act of 1987, Public Law 100-107, provides for the establishment and conduct of a national quality improvement program under which awards are given to organizations that practice effective quality management. The Act established the Malcolm Baldrige National Quality Award. In implementing this Act, the National Institute of Standards and Technology makes available guidelines and criteria designed for use by business, education and health care organizations for self-evaluation and improvement of their competitive positions.[3] In this paper, the NIST criteria are applied to DIA, under the premise that a U.S. government organization, through its component offices, could benefit from a systematic evaluation of its "competitive" position; namely, its ability to develop and maintain agility in a change-intensive environment.

---

[3] For background information, please see the website at URL: http://www.quality.nist.gov/.

LEADERSHIP

Leaders influence others to accomplish a mission by providing purpose, direction, and motivation. Baldrige leadership criteria apply to how the analysis organization's leader assigns tasks, interacts with analysts, and provides feedback. Within these three aspects of leader-analyst relationship, there appears to be a tension between initiative on the part of the analyst and direction on the part of the leader.

Task Assignment

Initiative. In many offices, analysis is self-generated. The office leader assigns each analyst to an area of the world and constantly pushes for finished products. The analyst is expected to act on his own initiative, do the analysis, and produce articles. In this scheme, there really is no clear top-down tasking process. One subject observed that leaders need to do a better job of prioritizing analysts' work because, even as analysts assemble data to put in databases, create briefings and produce finished intelligence products, they often write on relatively insignificant items. Their workload is usually events-driven. Consumers call in to their office and request certain information. The analysts attempt to tell the consumer what they don't already know. Their work may not always reflect the consumer's interests. To counter this tendency, some subjects maintain, managers need to incorporate a perspective on vital national interests into their analysts' tasks.

Another subject identified two ways in which analysis tasks are self-generated. In one, the analyst submits a formal proposal to do general research and, if approved, then does the work. In the second, the analyst submits a more structured proposal to study a region of the world by looking forward perhaps about 10 years. If approved, the analyst in this case identifies problems, examines them, and synthesizes them into most important issues. A problem and its attendant issues could become the basis for a National Intelligence Estimate (NIE).[4]

One subject noted that in a crisis situation, the analyst who answers the phone gets the job. For example, if the phone call comes at 1600 hours on Friday, then the analyst who has answered the phone would work with the consumer through the weekend if necessary. The study team thought that it might be difficult getting an individual to answer the phone on Friday afternoon. The subject, however, assured us that that was not the case. Indicative of the personal sense of responsibility and initiative felt by analysts, he asserted that they would actually want to get the phone call regardless of the time.

The self-generated analysis may have certain implications. First, the analysts may be doing analysis that serves the personal interest of the analyst, but does not meet a military leader's or other policymaker's requirements. Second, the analyst may be focusing atten-

[4] It is not uncommon for one of the National Intelligence Officers, who are the senior Intelligence Community experts on discrete topics, and who coordinate the production of NIEs, to visit with an individual analyst, or with small groups of analysts, to discuss such problems and issues.

tion on analysis projects that are the easiest or quickest to publish, satisfying a need of the analysis office, rather than producing analysis that is most beneficial to the Intelligence Community. Third, the analyst may focus on easier problems that reside in the short-term instead of tougher future-oriented problems in order to give the appearance of being more productive by producing more intelligence.

Directive. Each office leader tends to have a different method for assigning analysis tasks. In one office, the division chief ultimately assigns all tasks, regardless of the way the request comes into the subordinate office. Tasks come into an office through a "world-wide" collection management system, through internal DIA processes, through informal telephone calls from consumers, and through person-to-person memoranda. This practice may at times introduce some confusion in the office. For example, the leader may have a problem deciding whom to task. It may be appropriate to task the in-house analyst working in that area of the world, a member of a crisis response team, or a terrorist analyst.

There are certain implications when a leader directs an analyst to work a certain issue or problem. First, the leader may not be able to assign the "best" analyst because of workload. The best analyst may simply have too many projects on his or her plate or may have some other reason for making himself or herself unavailable. Second, the leader may assign a project to the wrong individual. The leader may not know who the right analyst is for a certain type of problem or issue. Third, the leader, by being too directive, may stifle the analysts' own creativity or initiative by keeping the analyst too busy.

Leader and Analyst Interaction

Initiative. Most interview subjects agreed that leaders from inside or outside their office do not interfere with the analyst's work. They provide oversight only when the analyst asks for it because analysts do not like to be micro-managed. Each manager considers his or her analysts subject matter experts. They may ask the analyst, "are you finished yet?" or "do you need help on A/B/C?" For additional support, analysts often appeal to other experts as needed.

The SIO for an office gets involved only if an analyst brings an issue or question to him. Sometimes, the SIO walks around the office, talks to the analysts, and looks for ways to help obtain certain information. The SIO gets formally involved in the analytic process, however, when the analyst has created the final product. Usually, it has been coordinated through the analyst's peers before it gets to the SIO. The SIO makes any substantive reformatting corrections before the final product can leave the office.

Directive. Usually during a crisis situation, there is face-to-face interaction between an office leader and analysts from the moment the requirement appears until it is met. One subject agreed that there should be a constant exchange of information between the leader and the analyst even during routine analysis. Some leaders are better at it than others. The lower level managers in their office worked directly with the analysts. Usually, they assign an analyst a project, discuss with them how to do it, and continually ask them how they are doing. Another subject described the production process this way: the analyst

produces, the boss does a sanity-check review; the analyst coordinates his or her work with other staffs, and they suggest changes.

Feedback

Initiative. The interaction between leadership and the analyst during feedback sessions varies from office to office. It usually follows a similar pattern: the analyst produces his or her findings, managers review the work; analysts make the recommended changes, and analysts coordinate the work with appropriate offices. In some cases, the analyst decides who should coordinate on his or her analysis. Competition between offices impedes the coordination process. One subject regrets that neither top-down guidance nor tools exist to support the coordination process.

One subject said all input from leaders and peers comes after the analysis is done. As a result, the usual case is for the assessment in the final product to be conceptually close to the analyst's own findings. Once the feedback process concludes, analysts are free to post their finished products on the electronic "broadcast" media. It is usually the case that one person from an office will post products on Intelink.[5] One office included in this study posts approximately 100 products per year on Intelink. An analyst may also send a copy directly to the consumer, or may inform specific consumers of its URL. As feasible, the product will be "downgraded" to a lower classification level by obscuring sources or methods to enable it to reach a wider audience on different electronic systems.

In one office, analysts put together products on an ad hoc basis to answer requirements from consumers. Finished products are normally briefings with supplemental documents—like maps or targeting materials—published either on the shop's website or forwarded to the consumer by email or hard copy. Another method of answering a requirement is to post the answer back into the production requirements system. In one office, leaders do not actively provide formal feedback to the analyst who puts the package together. Informally, however, the shop's leader will likely be tracking the progress the analyst is making in completing the tasking by checking the finished product before it is published in any format.

Directive. After completing the analysis, the analyst will normally present his or her information to a team chief or SIO for coordination. After considering the revisions, the SIO will give the analyst permission to send written findings forward. Because this information may appear unaltered in the U.S. President's read book, an SIO does not hesitate to "wordsmith. This feedback may be frustrating and humiliating for the analyst. The SIO may direct the analyst to fix the logical development of an argument or to present more and better data. Some analysts will simply rework their product and resubmit it to the SIO. Others, however, will discuss the comments with the SIO. The SIO typically prefers the latter method because the analyst will usually understand the comments better and

[5] Intelink is the Community's intranet, hosting "value-added" intelligence products.

will learn more from the experience. Almost all of the products go to their consumers; only rarely will a product be killed within the analyst's office.

Leaders tend to squelch any negative commentary on U.S. information operations (IO) issues. Their attitudes reflect an Intelligence Community-wide aversion to discussing IO problems associated with the U.S. or "blue" force. Intelligence analysts are free to discuss "red" force issues, but only military operations officers or "operators" are free to discuss "blue" force issues. As a result, decisionmakers must learn to seek information about the "blue" force from one source and information about the "red" force from another. They must combine the information themselves in order to get a full picture of the situation.

One subject suggested that ideally the analyst can encourage short, regular feedback sessions from the manager on an informal basis. For example, if the boss wanted a briefing for a future meeting, the analyst could give him some draft charts well ahead of time and expect nearly immediate feedback. In practice, however, the boss often edits only the final charts and returns them to the analyst who is forced under pressure of time to make the necessary changes. Interview subjects frequently alluded to this problem, and opine that such feedback issues remain a problem. Interview subjects nevertheless offered the following examples of good, direct feedback. First, an individual who was quite good at making changes would eliminate unnecessary words, shortening the report and making the wording much tighter. The analysts expressed appreciation of this feedback because of the value added to the product. In the second example, a manager was very good at grooming new managers. He would receive an analyst's report, then hand it to another analyst to review and comment. In this way, subjects noted, he was developing new leaders.

Comments

Good leadership demands high quality products to inform warfighters and policymakers. Leaders need analysis to answer tough questions. At the same time, managers need to keep in mind important questions about the analysis process itself:

- Are military leaders able to do their job better because of their analyst's product?
- Are the benefits of doing the analysis outweighing the costs?
- Are we doing risk analysis? That is, are we attempting to understand the balance between threat and vulnerabilities by examining local trade-offs?

Good leadership ensures a value-added coordination process. Analysts often find the coordination process tough. One subject said that before the first draft, the analyst's job was the best job. After the first draft, however, the analyst's job was difficult. Another subject called into question the coordination process because of the low quality of finished products posted in the database. Another subject said the coordination process is a humbling experience for the analyst because it is tough to get back your paper marked up with corrections. One subject said a co-worker tested the system. He worked really hard on one project and sent it forward. Next time, he slapped something together and sent it forward.

He noticed that it didn't make any difference either way. He was devastated. There was no motivation to excel. From these testimonials, one could conclude that unsystematized (non-standard) coordination may hinder the work of analysts.

Good leadership theoretically removes such barriers to effective use of analytical resources by providing leading-edge administrative and computer support; quick-turn-around graphics support for urgent tasks; and hassle-free travel support. One subject compared DIA administrative support unfavorably with what he grew to expect when he worked for the Central Intelligence Agency. He could drop something off at 5PM for graphics support and pick it up when he got to work in the morning. When he traveled, his proactive travel office would remove some of the hassles associated with traveling. He would tell someone in the travel office where he needed to go. They would call him back a short time later with all the information he needed to know about the trip. Then, when he got back from his trip, he told them what he did and they reimbursed him. There were no required travel reports and no receipts. In fact, they told him to get rid of all his receipts. In case he was caught; it would be better for no one else to know where he had been! One reason the DIA may be different is the fact that the CIA focuses more on covert operations than the DIA. Another reason is that DIA, a DoD organization, has stricter accountability rules and regulations than the CIA. As a result, the DIA analysts must do a better job of documenting their trip for accountability purposes. It would probably not be possible for the DIA to adopt the CIA process without some changes in the laws that govern travel accountability.

Good leadership intervenes to handle sensitive, political aspects of a job. Leaders may be able to supply the needed leverage or "muscle." For example, a limited number of analysts may be qualified to handle issues in a crisis situation. A trade-off may need to be negotiated between support for the warfighter and support for senior policymakers in the Pentagon, all within the Department of Defense. Further, leaders may need to intervene to facilitate interaction between the analyst and consumers in order to ensure that analysts anticipate and meet their consumers' priorities.

Summary

Leadership is a critical aspect in determining the success of the intelligence analysis process. Leadership demands high-quality products, ensures a value-added coordination process, removes technical or administrative barriers, and intervenes when needed. Some leaders assign tasks directly to the analysts. Others rely on the Senior Intelligence Officer (SIO) to assign tasks or rely on the initiative of the analysts themselves to seek out the right problems and analyze them. Leadership tends to provide little or no interaction during the analysis process except if and when the analyst seeks it. Analysts do not like to be micro-managed. In a crisis situation however, the leader takes a more direct and hands-on approach. Although feedback varied from office to office, ideally the analyst should seek short, regular feedback on an informal basis with the office leader.

STRATEGIC PLANNING

Baldrige criteria compel an examination of how an analysis office prepares for future challenges, records its institutional history, and uses academic or professional sources. Within the category of future challenges, a distinction may be made between *capability* and *issue* challenges. Future *capability* challenges deal with the people and process issues. Future *issue* challenges, on the other hand, are country- or target-dependent. These challenges deal specifically with the emerging threat to U.S. interests. Although none of the offices has a written, formal strategic plan, in most, leaders claimed to have thought about strategic planning issues and were working toward a future vision. Their daily mission though was to "get the right information to the right people at the right time."

Future Challenges

Capability Challenges. Organizational capability centers on people and processes. For those subjects who indicated that they have thought about the future in strategic planning terms, leaders recognized that the commitment of their people to an organizational ideal is a necessary ingredient for success. In practice, then, organizational capabilities must support strategic planning. Analysis organizations need to consider their staff capabilities and ensure that staffs have the necessary knowledge, skills, and tools for success. Our study subjects generally favored a team approach for intelligence analysis. Leaders wanted analysts to consult with experts and coordinate with stakeholders before sending the final product to consumers.

Most office representatives said they had just the right mix of people for their mission. In one instance, an office had been given an abundance of people and other resources. However, if some other offices only had a few more people or more resources, then they too would be able to do much more for their consumers. Since they were already meeting their mission requirements, they did not expect to have additional people bestowed on them. In fact, office leaders reported that they had to fight annually to maintain their personnel resources, as many capabilities are fungible from one office to another. One office among those examined expected to hire several more entry-level people. An advantage of this approach is that new people tend to be more computer-literate than older staff members. An unsurprising tradeoff is that new people also tend to be less well-educated, in a professional sense, in their specialty. Another subject said there was no real future planning for their office personnel. The objective was to get analysts through identified training requirements so they could produce reports in order to fill databases.

Since none of the subjects claimed to use a formal strategic planning process, our study team could not discuss the process with them in detail. A generic strategic planning process, however, should include (1) doing advanced planning, (2) performing an environmental scan based on external and internal information, (3) setting a strategic direction using the vision statement, (4) translating the strategic direction into action via an implementation plan, and (5) making a performance evaluation. A performance evaluation or assessment should include (1) defining goals, (2) describing success, (3) set-

ting targets, (4) measuring performance, and (5) adjusting goals based on performance. The DIA has a formal process to do strategic planning, but it was not clear to the study team how the organizational strategic planning process might be linked to the lower levels of the organization.

Issue Challenges. Concern about issues centers on the mission of each analysis office. Evidence from this study indicates that an SIO often thinks about future issues. For example, he may hire external contractors to investigate an area of interest. One office recently commissioned a study to look out 5-10 years and make recommendations on a specific issue. Those recommendations addressed the question of what they needed to do now in order to prepare themselves for the envisioned future. One subject stressed the extant ability of his office to remain flexible and to evolve thoughtfully, guided by its own resources and instincts. As evidence in support of such confidence, he noted the office's demonstrated ability to anticipate warfighter needs. Another subject asserted that his office simply follows issues (in the widest "all-source" sense) as they are developing so when they are called to support a requirement, they are aware of what is going on and may have some work completed already.

One subject offered an example of an office in CIA that he was invited to join a few years ago. It was a new organization and analysts joined it by invitation only. Analysts regarded it as a fun place to work because they had an opportunity to be innovative. The office wanted to look at the world in a new way. One type of project associated with this office was a study of demographic changes and political instability within the major cities of a certain foreign country. He said they wrote five case study documents covering these places of interest in considerable detail. Such detail on individual cities was unusual for an Intelligence Community product, and at the same time greatly appreciated by consumers. According to our subject, this office no longer exists in the CIA. When offering it as an example of good intelligence, he implied that it may be worthwhile for DIA to stand up an office like the former CIA office to deal with today's complex issues.

Institutional History

Most subjects said they did not have a written institutional history. There exist no formal analyses of their office's strengths or weaknesses. The office does rely, then, on retaining experienced individuals for its corporate memory.[6] Some offices maintain briefings about their office's operations as a surrogate for a written institutional history. Anyone assigned to an analytic unit is expected to set about building connections and learning operations and systems. Only one subject said they had formed a history office to record significant events for their office, beginning in the late 1990s. Even this admirable initiative, however, with its focus on events, rather that process itself, would fail to capture the nuances of truly useful and recoverable institutional history.[7]

Academic or Professional Sources

In the interviews, office leaders tended to support academic training, attendance at professional conferences and conventions as experiences useful to the development of professional expertise. However, there exist at the office level no guides or plans for such professionalization opportunities.[8] Within an office, professionalization appears to be driven from the bottom up. If an analyst learns about a class or other certifiable learning opportunity, the agency's training center resources can assist with financial support, assuming office politics and workload do not intervene. Interviews revealed that little

---

[6] DIA does operate a mentoring program to ensure that some corporate memory is passed to younger analysts. Facilitated mentoring can cut on-the-job training time by up to half and may be a key factor in the retention of entry-level hires. However, participation in the mentoring program is relatively small compared to the entire workforce. Even if some employees enter into a mentoring relationship, there is no guarantee that the process will be successful. Potential pitfalls include: unrealistic expectations, supervisor unsupportive, relationship derails, shortage of good mentors, differences (style, ethnicity, gender, age) interfere, and relationship is a poor fit. Although U.S. Government and Department of Defense regulations do require that agency, and by extension, office products and communications be preserved as official records, the combined procedural and target knowledge required to create actionable intelligence typically escapes being recorded in the impersonal domain of such records.

[7] One exception to this rule is the Agency's *Military and Geographic Intelligence Cookbook*. The Joint Military Intelligence College also offers an exception to this state of affairs, with its publications *Writing with Intelligence* (August 1995), *Briefing with Intelligence* (August 1997) and *Research: Design and Methods* (September 2000), which capture the combined experience of student and faculty interaction in teaching and learning about intelligence studies.

[8] Career development is a continuous career-long process of self-assessment and planning that helps employees integrate their career goals with their organization's mission and needs. The DIA Career Development System (CDS) is designed to assist employees in career planning and development. Components of the CDS include: entry level development program, designed to train and develop entry-level employees, and the career service program, designed to enhance DIA's work environment and improve employee productivity.

emphasis is likely to emanate from office or division managers. Most requests are driven by personal interest and are authorized so long as funds exist to support it.

Each analysis office uses academic and professional sources in a different way. One office hires contractors to provide them with computer support. Another office employs over 100 contractors and academics to perform tasks in an external research program. In this case, according to interview testimony, analysts are able to integrate the outside research into their daily operations only with some difficulty. For example, analysts in this unit had to learn how to integrate data on cyber-terrorism and IO into counterterrorism analysis. Representatives from one office visited Unified Command Joint Intelligence Centers to learn to do this better. Another office used the *Military and Geographic Intelligence Cookbook* (MAGIC) to inform their analysts of "everything they needed to know to do their job." If the analysts had not used a specific tool in a while, then they consulted MAGIC to refresh their memory.

Richards J. Heuer, Jr., a senior CIA analyst, has tried to acquaint analysts at that agency with methodological developments in socio-political analysis that were being developed and tested in the academic world. He had to keep at it for more than a decade to be heard.[9] He has often met with strong resistance. Only a few academics willingly come to the agency to talk with the analysts. "Factions," an analytical tool developed at CIA for systematic analysis of political instability, is a good example of research and development (R&D) work done in collaboration with members of the academic community.[10] In the 1980s there was no particular pressure or encouragement across the Community to use structured analytic methods. Analysts gathered the facts, looked at them in their uniquely "logical" way, and came to some conclusions. Some DIA analysts use structured techniques to do intelligence analysis. The subjects we spoke to, however, described their analytical process as gathering facts, examining them logically and drawing some conclusions. More emphasis on structured techniques at DIA may be appropriate.

Summary

Although none of our subjects had a written, formal strategic plan, most of them had thought about strategic planning issues and were working toward a future common vision

[9] Finally, on 20 June 2000, at the inauguration of CIA's Sherman Kent School, which features a curriculum for new analysts, Heuer's campaign reached a pinnacle of acceptance by the agency, evidenced by his book's, *Psychology of Intelligence Analysis* (Washington, DC: Center for the Study of Intelligence, 1999), being the focus of remarks by invited speakers. Another senior CIA analyst, Morgan Jones, had a few years earlier published a compact summary of "Fourteen Powerful Techniques for Problem Solving," some of them having been developed exclusively by agency analysts, in *The Thinker's Toolkit* (New York: Random House, Times Books, 1995), reprinted in a slightly revised edition in 1998 by Random House's Times Business division..

[10] Stanley A. Feder, "Factions and Policon: New Ways to Analyze Politics,'' reprinted from CIA's *Studies in Intelligence in* H. Bradford Westerfield's *Inside CIA's Private World* (New Haven, CT: Yale University Press, 1995), 274-292.

among the personnel in their office. Office leadership is often engaged with senior leadership about future issues. Managers know the direction they want to go in and recognize the need to support a strategic plan. Furthermore, a focus on important future issues such as which country is most problematic clearly makes an analysis shop proactive and saves time in crisis situations.

Theoretically, the strategic management process includes (1) advanced planning; (2) an environmental scan that includes a review of internal and external information; (3) setting a strategic direction; (4) translating the strategic direction into action; and (5) evaluating performance. Consumers, stakeholders, and subjects influence the process by stating their requirements, receiving products and services, and providing feedback. Information and analysis influence each step of the process by providing management with important information, data, and feedback.

Most of our subjects relied on the corporate memory of senior analysts instead of maintaining a recorded institutional history. As senior analysts approach retirement age and leave government service, analysis offices will lose a great deal of expertise. Some offices maintained a written office history or had on file significant briefings about their office's operations. All of our subjects used academic or professional sources to develop their capabilities as needed. They also knew what commercial tools were available to help them to do more for their consumers.

CONSUMER FOCUS

The Baldrige criteria applicable to a consumer focus suit the DIA case very well. As an information organization, this agency is obligated, through its analysis units, to discern consumers' requirements. A key question for this study is whether relationships with consumers tend to be *ad hoc* or the result of a deliberate strategy.

Consumer Requirements

Consumers make their requirements known through a formal production database, telephone calls, individual initiatives, by e-mail, and through personal visits. They make their initial requirements known primarily on an *ad hoc* basis. The most meaningful requirements are informal because the analyst gets to talk directly to the consumer. Subsequently, the analyst can help the consumer refine the formal request in the Community's intelligence production database. Some consumers make telephone calls to analysts that require an answer in two hours or less. This can make the analyst's job very stressful. Consumers use emails, on the other hand, as a secondary contact medium and mostly for follow-up activities. On occasion, a consumer will come to the analyst's office to maximize the opportunity to gain a very specific pre-deployment, contextual understanding of target information. One subject noted that although most analytic tasks are management-driven, there are also many self-generated products. The latter could have a positive effect, especially in promoting analyst self-esteem, so long as the self-generated products are of interest to the entire Community. In one case made known to the study team, an office leader asked analysts simply to produce products for their databases. As a result,

analysts chose subjects that they could write about more easily in order to meet their deadlines, rather than picking topics that represent the "tough questions" and that would be most useful to the Community in general.

Consumer and Analyst Interaction

The different frames of reference that one might expect to characterize any interaction between analysts and consumers are on vivid display in anecdotes related by most interview subjects. Much of the time, consumers appear to shy away from direct interaction with an analyst. On occasion, the consumer's rank is too far above that of the analyst to allow an analyst to directly approach an individual consumer, especially in an organization like DIA, often still characterized by a culture that finds meaning in and derives behavioral clues from a hierarchy of authority. Occasionally, however, informal interaction does occur, to include face-to-face conversations or telephone calls to enhance clarity of requirements. One subject noted that his contact with consumers is mainly personal and direct. This analyst works with consumers to build training products that look as much as possible like the real world. Toward that end, an analyst might attend survival school as a student, rather than as a VIP, in order to absorb and then re-create more realistically some part of that training environment. On issues related to training, analysts tend to go to wherever their consumers are located. There, they interact directly and build products together. Consumers also come to DIA. For example, one analyst recounted his experience with a Navy SEAL who sat next to the analyst during the production process. In another example, one analyst worked closely with an Air Force consumer on a downed pilot evacuation and recovery area study.

Some subjects claimed to have little or no interaction with consumers. One subject said there was some consumer support at the analyst-to-analyst level and through informal channels. As a general rule, however, there is no regular contact with a consumer. Therefore, the role of consumer often is represented by whoever becomes a reader of a particular publication.[11] Production tasking usually passes through bureaucratic levels at both the producer and consumer ends, which reinforces pre-existing tendencies keeping analysts and consumers away from each other. Suddenly, an answer to a formal or informal request simply appears. A general absence of feedback from consumers characterizes the intelligence production process in the offices included in this study. Any interaction with consumers that does occur happens on an *ad hoc* basis.

---

[11] Because most products are published electronically on systems such as Intelink, it is possible for the agency to track in considerable detail the organizations and even particular analysts that access and explore particular documents. In practice, however, this is rarely done at the level of detail that allows an analyst to be certain who the consumer really may be. Even if one accepts the concept that within the Department of Defense, information becomes actionable intelligence mainly through the briefing process, it is wise to remember that cognitive processes do depend ultimately on purposeful information-seeking activity, which can hypothetically be tracked in such detail as to inform intelligence producers exactly who their true consumers really are.

Feedback

Analysts provide finished products to their consumers in a variety of ways: through the formal production requirements management database, in hard copy, posted to a website, or by email. Sometimes, depending on the size of the electronic file, analysts post a product on a "hidden" URL. Then, they call a known consumer to let them know where they have posted the product. Once the consumer has the product, the analyst can delete it from the system. Feedback appears in many forms. In one office, informal feedback predominates through personal contact with the consumers. Another office obtains consumer feedback either via the office web site's "feedback" button, or via a verbal response from the consumer that the product met or did not meet the need. Hard copies automatically include a publication office's formal feedback form. All products do not get this form. One subject said a team in their division uses a questionnaire to find out if their consumers liked their product. One office maintains a sizable travel budget so analysts may travel to their consumer's office regularly.

Sometimes analysts are told when they did a good job. They are also told when they could have done better, a phenomenon that has become more common with the advent of impersonal electronic communication. Consumers can be very specific. Analysts provide briefings to their consumers and they attend briefings by consumers. They may get a phone call saying either "great job," or that the Admiral wants to know why the analyst came to a certain conclusion. Sometimes, the analyst writes for a specific individual. The individual consumer almost always responds positively in this scenario. If the product goes directly from the analytic office to an individual, then there are not many levels of review. In such a case, reviewers will include a (1) branch chief, (2) the DIA Office of Research, and (3) the Division Chief. If, however, the analysis office broadcasts the product, then the review process can reach extremes of review and coordination.

Marketing a product can attain great importance. An analyst typically does not want his or her finished product to sit on the table in the J-2's office. The usual desire is for the information to reach much lower levels, where the material remains actionable information, which may only later become actionable *intelligence*. They do this by using different means of communication. For example, they publish their results using different media such as in the *Military Intelligence Digest*, which features strategic or operational assessments; the general finished intelligence database, known as Intelink; serialized DIA publications, and informal contacts with consumers around the world. The analyst who writes the product can market it by mailing hard copies, by telling people where to find it on Intelink or by responding to specific requests by sending email attachments or making a personal phone call.

Summary

Building relationships with consumers tends to be more *ad hoc* than the result of a deliberate strategy. Although consumer feedback varies from office to office, most of the subjects said that "working-level" consumers support their intelligence analysis process. Some got feedback from an office web site. Others got it through verbal interaction. If

funding is available, then analysts visit their consumers often to learn about their requirements and get feedback about past performance. Often these consumers will visit the shop to let them know what they need and to describe how particular, related products have been used in similar situations in the past.

Likewise, the way consumers make their requirements known varies from office to office. Consumers continuously provide information as they themselves move along in the analysis process.[12] Analysts preferred a phone call from the consumer first so they could coach the consumer through the process of documenting their needs in the COLISEUM database. Once the analyst completes the product, they market their work. Analysts used different methods to make their products available, improve their chances of getting their information to the appropriate consumers, and ensure consumers have an opportunity to use their product.

INFORMATION AND ANALYSIS

Information and analysis criteria address the question of how well DIA offices are meeting challenges in this core functional area, and reveal whether a meaningful approach is being taken by the organization for measuring product quality. Representatives of most of the analysis offices indicated that they are meeting the requirements embodied in these criteria. Informal means for measuring analysis performance included counting products, meeting production schedules, regularly updating databases, answering key consumer-oriented questions, and gauging performance based on "perception."

Meeting Current Analytic Challenges

Specific indicators of success that were quickly asserted by interview subjects included the following:

1. Positive comments or lack of negative comments from consumers;
2. Evidence of consumer use of intelligence products;
3. Knowledge of the number of terrorist attacks averted;
4. A downward trend in the number of requests for information (RFI);
5. Evidence of improvement of analysts' capabilities based on accumulated experience.

---

[12] DIA has begun serious promotion of collaborative intelligence production across the defense intelligence agencies, military service intelligence production facilities and among Unified Command Joint Intelligence Centers through the Joint Intelligence Virtual Architecture Program (JIVA). This program allows individual analysts from across the defense intelligence community to rapidly find, access, and use trusted information of all types and classification, without knowing its location or format, and to do their jobs easier, faster and better. JIVA provides a virtual, interactive environment for the development and exchange of responsive, tailored all-source Intelligence and value-added analysis.

Subjects easily enumerated evidence associated with each of these indicators. For example, if consumers are satisfied with the analyst's work, then they provide positive feedback via any number of methods. The amount of positive feedback, however, is usually meager. Not surprisingly, a tendency exists for a dissatisfied consumer to be more vocal. A lack of negative comments from consumers is therefore considered a positive indicator of success. Consumers never want DIA to stop sending them daily intelligence products. Even if routine DIA assessments are only placeholders, the consumer still expresses a demand for the products because one article could change everything.

Whether the consumer uses the intelligence product is another indicator of success. Analysts do need to know how many consumers read DIA products and find them useful. In actuality, a production office is only rarely able to gauge the use and impact of either particular products, or the office's overall production. Ideally, the office's products are suited for use without modification, as formal or informal coordination is expected to contribute meaningfully to the production of each item. The concept of usability depends on being able to measure whether information embodied in the office's products are "actionable." Measurement of actionability is never easy because often no recordable action is required, and the producer faces the difficult task of determining whether the product has simply influenced the way a consumer views an important issue. No one from among the offices under study here claims to have an answer to this difficult issue.

Likewise, a great indicator of success would be the number of terrorist attacks averted. It is rare, however, for DIA to learn about a terrorist cell whose members talk about an act of terrorism, prepare the attack, and then stop as a result of DIA's informing the specific target or the larger public. With continued capabilities to collect information without the target's knowledge, measurement of such occurrences is certainly feasible. With increased emphasis on collaborative counterterrorism analysis, some of the best minds in the Intelligence Community are now addressing this very problem.

DIA analysts often find themselves responding to formal Requests for Information (RFIs) from consumers. Another positive measurement standard, then, although an indirect one with the potential for unknown intervening variables, is a downward trend in the number of RFIs. Analysts do assume they are doing something right if the number of RFIs from active consumers are declining in number. Of course, if only a few RFIs make up this measurement, then some means of weighting the breadth of the requests needs to be considered. Over the course of a year, however, the substantial number of RFIs would allow the laws of probability to operate in support of attaching meaning to a statistically significant decline in overall RFI numbers. Nevertheless, at least among the offices in this study, no such statistically based measurement is practiced.

A different type of indicator of success is the level of improvement in analyst savvy, given the accumulation of experience. An office's SIO is in a good position to determine whether the analyst is making improvement. Comments from the SIOs contacted in the course of this study indicate that they examine the analyst's work with a critical eye to determine whether the analyst is growing in the job. If it is determined that the analyst is in fact getting better at doing analysis, then the SIO rewards the analyst with more work

and more challenging jobs. The SIO also rewards the analysts with an appropriate performance review. If however, the analyst does not show improvement in the current task, then the SIO working with the analyst and manager will attempt to diagnose the problem and provide appropriate training to improve proficiency in doing analysis.

One indicator of success that is not appropriate is that associated with a specific forecast of events. One subject noted that one must be cautious in making such a forecast, and then watching to see if the projection is correct. Office representatives observe that this approach does not constitute a good indicator of success because it may be misleading to track, as analysts have the opportunity to continually reshape their forecasts and analysts and professionals do not like the idea of being graded on their own judgment calls. To illustrate, one time an analyst wrote a paper on Kenya. The prediction was that Kenya would be stable over the next five years. In the third year, however, a destabilizing coup was attempted. The analyst had failed to account for a coup attempt, but since the coup failed, the analyst's judgment was confirmed—he was correct. But were the analyst and his product really successful?

A Standard Approach to Measuring Quality

No subject claimed to have plans to implement any kind of standard approach to measure analytic quality. One subject said he was not opposed to some standard for measuring quality. He has not, however, seen a useful measure for it. In another office, analysts "just publish in order to keep their database filled." Little or no attention is given to quality. Either the product meets the requirement or it doesn't. Another subject said even if he thought measuring analytic quality was a good idea, no one in his office would do it. Managers in his office, however, are examining ways to do things more effectively without destroying the office's "can-do" ethos.

Comments

All of the subjects said they had no formal performance measurements, but neither did they employ informal means. To justify this situation, one subject said intelligence analysis is purely subjective. There are no numbers to count. If analysts meet their production schedule, then they are considered to be successful. If analysts get all of their work done, then they have met the minimum success requirement. If analysts get all of their work done and they are also able to get *ad hoc* work done too, then they are considered more successful. No one interviewed would accept the idea that there may exist valid quantitative measures of analytical success.

Managers of intelligence analysis are ambivalent about managing for results. Though interested in demonstrating success, they are uneasy about being held accountable for poor organizational performance. There are severe problems in measuring performance in practice: (1) problems in getting agreement on what good performance means for intelligence analysis; (2) intelligence analysis goals are unreasonable compared with available resources; (3) key performance indicators are unavailable or too costly to collect; and (4) management is unwilling to make necessary changes to improve intelligence analysis.

Informal evaluation of analytical quality of course does occur. In many cases, an office SIO is expected to contribute to an analyst's performance evaluation. For example, the SIO might show the division chief examples of the analyst's work and point out what is good about it, what is a problem or an opportunity for improvement, and whether the analyst has learned from experience. Office leaders appear to be most interested in how many products the analyst finished, even though this crude measure is not supplemented with any method for independently weighting the relative value of those products.

One subject noted that his office does track certain indicators of quality, such as whether the consumer liked the product. A subsidiary indicator lies in evidence of whether the consumer responded to the product. Did anyone else want a copy of the product? Some have developed a measure of the significance of the problems they analyze. For example, an imminent terrorism problem, compared to a future military planning problem is more significant and would fit on of the high end of their measurement scale. The SIO or division chief for this office would maintain a matrix of products by author and subject.

One subject prefers using the term "gauge" instead of "measure" because "measure" assumes some sort of reasoned technique. Often, there is a bit of a "gut check" in any office with respect to how well managers perceive their office to be meeting its mission. Most of the measurement comes in the form of *ad hoc* consumer feedback. A well-executed mission, like a successful noncombatant evacuation operation (NEO) for instance, tells the office that they are doing a good job.

Summary

Informal means for measuring analysis performance included counting products, meeting production schedule, updating databases, answering key consumer-oriented questions, and gauging performance based on perception. Two common ways for analysts to know if they are meeting their consumer's needs are by a lack of negative feedback and by an increase in product use. Our subjects do not keep track of forecast accuracy because it is too difficult to track. Instead analysts individually keep a mental checklist on any forecasts they make and how the situation developed over time. Although none of our subjects planned to implement any standard approach to measure analytic quality in the near future, they continue to examine ways to do analysis more effectively without destroying their organization's "can do" ethos.

PEOPLE AND RESOURCES

The people and resources category offers criteria to examine the knowledge, skills, and experiences of the analysts and the availability of analysts' tools. Leaders can improve the quality of a product by promoting greater expertise among the intelligence analysts and by inducing analysts to take advantage of information found in open sources. Study subjects said they need analysts who think across interdisciplinary boundaries and they prefer analysts who have military operations experience.

Most of our subjects assert that they are well-qualified to perform their mission. One office was gaining personnel resources quickly because their issue is very visible. In the recent past, the boss would train the new analysts. Today, however, the office that has grown so rapidly finds that even the bosses are all new. They appear to need a formal training program targeted at the office level, rather than merely at individuals.[13] Another office whose personnel resources were static considered itself successful because they are meeting their requirements. They could be better if they had better tools and if they had a few more people in the office. They note that static personnel resourcing makes them less successful than they could be, but not unsuccessful. Another office claimed to be understaffed. To make matters worse, they suggest that they have the "wrong" people in management positions. Even within the small sample of offices in this study, there appeared some examples of high-interest areas where analysts whose experience had been gained in other functional areas are now "parked" pending retirement. This is clearly a poor management practice. It is the result of an archaic government personnel system and is common practice throughout government.

Knowledge, Skills, and Experience

According to representatives of the five offices in DIA, analysts bring with them or develop certain skills to help them perform their analysis and at the same time they must develop an awareness of how certain analytic pitfalls may influence their work. The analytic skills include: (1) technical or topical expertise; (2) knowledge of the target, sources, and analytic techniques; (3) ability to search and organize data; (4) ability to synthesize data or use inductive reasoning; and (5) ability to express ideas. The analytic pitfalls include: (1) personal biases or inexperience; (2) lack of data or access to data; (3) asking the wrong question;[14] (4) misunderstanding data; (5) flaws in logic; (6) no review or evaluation process; (7) denial and deception by the target; (8) politicization or non-objectivity; (9) groupthink; and (10) mirror imaging.

A synthesis of interviews conducted for this study suggests that analysts need to learn how to think across disciplinary boundaries. As a general rule, analysts do not learn to think across disciplinary boundaries in school. One subject suggested that analysts could take (remedial) philosophy courses in order to learn how to think across disciplinary boundaries. Another subject suggested that cross-disciplinary education continued in their

---

[13] Joint Military Intelligence Training Center courses are designed for students who have no experience or have limited previous experience in intelligence at the joint, combined, or national levels and have job-related requirements for knowledge of intelligence at the national or strategic levels.

[14] The problem of asking the wrong, or the right, question is especially noticeable in strategic analysis, the type of analysis produced by DIA in support of the Chairman of the JCS and the National Command Authorities. This problem has been addressed succinctly and with examples in Patrick J. Haney, "Soccer Fields and Submarines in Cuba: The Politics of Problem Definition," *Naval War College Review* 50, no. 4 (Augumn 1997): 67-84.

shop because personnel possess deep knowledge in history, political science, and economics. These people also had computer skills, and 5 to 25 years of intelligence analysis experience each. One subject added that the people in their office who started DIA employment in the 1980s had fewer computer skills, but knew more about their subject matter. Younger people tend to be gifted at using digits to display information. Their elders claim that they lack the skills necessary to infuse meaning into the displays.

One subject said they have area specialists, social scientists, former military personnel, former law enforcement agents, active-duty military professionals, and reservists with long active-duty backgrounds. They like having an office filled with people who have the different perspectives. They have senior people with lots of experience. Then there is a big drop-off in experience among the lower level staff members. One problem frequently voiced is that new hires top out in four years at the GS-13 level, then they have to move out of the office to continue advancing in their career. A consensus exists among office managers that any office struggles to maintain their analysis capability as people move to better jobs for promotion. Having people who are career intelligence officers, especially if they also possess a military operations background, is commonly cited as a key to a quality staff.

Tools

Subjects of this study reported using a variety of common tools to accomplish their missions. These tools included:

- COLISEUM (Community On-Line Intelligence System for End Users and Managers--an intelligence production requirements database);
- JWICS (Joint Worldwide Intelligence Communications System--featuring Intelink, the Community's finished intelligence database), Websafe (a message handling system) and VTC (Video Teleconferencing) to communicate with consumers;
- SIPRNET (Secret Internet Protocol Router Network);
- OSIS (Open Source Information System), and NIPRNet (Non-classified Internet Protocol Router Network);
- DITDS (Defense Intelligence Threat Data System);
- DIA and DODIIS (DoD Intelligence Information System) e-mail.

Analysts use a variety of techniques and tools to produce intelligence. Techniques include pattern analysis, systems analysis, quantitative analysis, modeling, and inductive reasoning. Analysts use tools specific to their form of analysis. These tools include the following:

- *The Analyst's Notebook*, featuring visual investigative analysis software that assists analysts by uncovering, interpreting, and displaying complex information in easily understood chart form. It includes a link notebook for link analysis and a case notebook for time-event analysis.
- *Hugin Expert* is artificial intelligence software based on Bayesian analysis. Bayesian analysis is a compact model for representing reasoning under uncertainty.

- *ESRI* (Environmental Systems Research Institute) GIS (Geographic Information System) is a core set of application tools for organizing and analyzing geographic information. *ArcView* includes powerful visualization tools to create maps.

Summary

Analysts need to be able to think across interdisciplinary boundaries and have military operations experience. Senior analysts tend to be subject matter experts. Newer analysts, however, tend to be more computer literate. Our subjects liked having staffs with a diverse mix of experiences. They recommended tools such as the analyst's notebook which features time-event analysis and link-analysis; *Hugin Expert* which features Bayesian network analysis; and *ESRI GIS* which contains ARC-View. They also use numerous intelligence-related classified databases and other open sources.

PROCESS MANAGEMENT

Process management criteria apply to information handling, intelligence analysis, and collaboration. Processes associated with the dissemination of information and intelligence are beyond the scope of this study, but in this area, the advent of online publication and the loosening of "need to know" rules governing access to sensitive information have relieved some classic dissemination bottlenecks.[15] Good analysts are commonly characterized by DIA officials as "focused freethinkers." Other commonly acknowledged maxims are that the analysis process is a highly competitive process, and that analysts rush to be first to publish vital intelligence findings. At the same time, analysts must work together by collaborating with other analysts to ensure accuracy.

None of our subjects said they observed a formal or structured process in doing intelligence analysis. One subject summed up this approach as simply "sitting down and going to work." A second subject claimed to use an informal and semi-structured, term research process. In this mode, the analyst first has an idea related to their "account." They discuss with their team chief the problem they are interested in solving. If they get permission, then they do the research. Another subject added that, likewise, he does not have a "hardwired" approach, yet applies a routine to the process. One subject said his office has a process that only remains in the mind of each of the office's analysts. It is, in the estimation of this subject, an application of the scientific method or at least a disciplined thought process. In this scheme, managers give the analyst a problem, and the analyst does research to determine what they have and what they need. If there is time, he or she will request collection of certain data. The analyst reviews the data and answers the question. Sometimes, the analyst will get feedback (either good job or please do better next time). Typically across the offices examined here, there is no standardized way of conducting

[15] Modification of the "need to know" principle as it applies to information systems has been accompanied by the use of effective counterintelligence tools that allow detailed tracking of actions taken by individual analysts in the handling of sensitive information.

analysis. This situation may be a tacit response to the philosophy expressed by office leaders that they try to encourage "out-of-the-box" thinking.

Information Handling

Analysts do their own fieldwork to gather any information beyond that from routinely available, written sources. One SIO emphasized that his analysts "gather" information, they do not "collect" it. For example, they do not have diplomatic immunity when they are visiting other countries; they must get specific permission from the country to be there. Standard Community information is derived from imagery, signals, human resources, "open" sources, and other technical means. The kind of information that analysts use is problem-dependent. They may use operations-support products such as maps, imagery, and target materials. Some analysts tend to use information from the source with which they feel most comfortable. For example, some like using signals information and rely solely on it. Office leaders typically try to accustom analysts to using multiple sources of information including the Internet.

Analysts report that they try to lay down the steps of their analysis in a logical way. For example, they use several paths to move from general information to more specific information. Some analysts write their papers as if they were doing research in a graduate school. Others write products that look like newspaper articles. Analysts tend to protect their sources in a manner similar to the way newspaper reporters protect the identity of their sources. They use a general description to protect the identity of the informant. For example, a writer may attribute a quote to a high level authority in a specific DoD organization such as the Pentagon. The reader may judge for him or herself whether the source is reliable, but is unable to precisely identify the source.

Intelligence Analysis Process

The analysis process includes (1) problem identification; (2) data gathering; (3) analysis, synthesis, collaboration, and examination of alternative propositions using all sources of data; and (4) direct support to consumers with briefings and publications. In the end, analysts make an assessment of what the data probably mean or what the data could mean. General Colin Powell (USA, Ret.) sums up his expectations as a consumer of intelligence in this way: "Tell me what you know, what you don't know, and what you think—in that order." In this oft-quoted dictum, he suggests that analysts can best convey what is known about the problem, evaluate the completeness of their knowledge, and interpret its meaning. It remains unclear whether the same guidance is as suitable for written products as for oral briefings. In the course of analysis, whether presented in written or oral format, it is important for the analyst to answer for himself certain key questions:

1. What do you know about the issue?
2. What is a logical, sequential way to present the facts?
3. What conclusions or implications can be drawn from these facts?

Analysts generally find it distasteful to coordinate their products with members outside of their team. Nonetheless, when the "corporate" analysis process works as it can, all of the teams contribute to the analyst's final product and, as a result, the analyst produces a superior product. Managers do want analysts to exchange information with each other. They have a distaste for competition among analysts. The analysts' rationale for resisting widespread coordination is that they consider themselves subject matter experts.

Beyond the thicket of coordination and collaboration, the analysis process becomes tough to execute when the office finds that several consumers demand attention all at once. When this occurs, the office's cradle-to-grave, face-to-face, and surge-flexible process becomes overwhelmed. One subject acknowledged that the tension between higher and lower echelon consumers and the tension between two or more concurrent contingencies gave them the most concern. Consumers typically ask the office's leaders to intervene when they believe the office is not meeting their requirements. As a result, the analyst can expect to have to shift priorities and perform many tasks under a great deal of stress.

Collaboration and Competition

Collaboration. If analysts choose not to collaborate with other Community experts, then the SIO may force them to do so during the coordination and review process. Managers want analysts to verify the validity of all of their information in a manner similar to the way that they feel compelled to check and verify human-resource information. They also need to confirm source reliability, be able to articulate the method they used to derive the information, and to confirm the information's contextual accuracy.

Competition. Collaboration among intelligence analysts is always a problem because analysts, like many school children, tend to be competitive with each other. The acknowledged lack of coordination within DIA is not a new or exceptional phenomenon. New analysts may not know who to talk to on a particular subject or where to go to get useful information. A more senior mentor or manager can usually provide the analysts with that kind of information, but the exchange of information between analysts doesn't normally happen in the unsupervised work environment. Analysts are very competitive within the office and especially with other agencies in the IC. There is a strong desire to publish first, a tendency that inhibits full disclosure to competing analysts. Other intelligence agencies usually have more resources than DIA and can report an item more quickly than DIA. From another perspective, one subject reflected on how analysis was done at the CIA many years ago. He said CIA analysts would initiate collaboration when necessary and had occasional meetings to share information. They had mixed luck with people external to their organization. Academics sometimes refused to talk to them. One time an ambassador was reluctant to talk with them. Overall, he concludes that there was very little collaboration "back then." He provided two examples:

First, all cross-office work was called "collaboration-by-staple." One person would write the first half of the paper and the other person from a different office wrote the second half. A person from a neutral third office would edit the entire paper. Then they would

staple it together and send it out. A more truly collaborative work environment would have made it easier for the analysts to bounce ideas off of each other and test their assumptions. Back then, everything was much more competitive even than today.

Second, message traffic came into the office mainly in paper format, rather than the electronic format of today. One clever analyst would come into the office each day much earlier than anyone else. He would review the message traffic, take the good papers, and then produce analysis on interesting topics that he would present later in the morning to his office leaders. Others in the office would be left to report on the remaining message traffic that was less interesting. In this subject's view, the office leaders unfortunately let this go on without intervention.

Summary

Good analysts are "focused freethinkers." Nevertheless, "out-of-the-box"-type thinking needs to be tempered by using an informal, disciplined thought process and collaborating with other analysts The scientific method is a streamlined process that ensures the analyst doesn't wander too far. Use of information is problem-dependent. There is, however, a general consensus among our subjects that analysts should use everything they can get their hands on. Analysts also need to assess the reliability of their sources and at the same time, protect the identity of sensitive sources. Collaboration tends to vary by organization and by issue. Collaboration tends to be better between analysts within DIA than between analysts from different parent organizations such as between CIA and DIA. There tends to be a competitive nature among analysts to be the first to publish their product.

MISSION ACCOMPLISHMENT

The mission accomplishment category examines the analyst's definition of success, and proceeds to secure an estimate of the percentage of time analysts believe they are successful.

Definition of Success

All of our subjects agreed that success is a difficult concept to define. Our subjects did, however, agree that it might be possible. First, success is positive feedback from consumers. If they do not provide explicit positive feedback, then the analysis shop can look for indirect indicators. For example, if the consumers keep coming back for more analysis, then analysts consider their products successful. Another informal way of measuring success was to count complaints.

Second, an intelligence analysis success occurs when a unit that is known to depend on DIA products completes its military operation successfully. If, however, there is loss of life during a mission, then the analysts are greatly disturbed. Their product may have in some way contributed to the lack of success for the military operation.

Third, success is obtaining an expanding budget and a growing workforce. These developments indicate that the topic focus is perceived as interesting by agency leadership. One subject labeled this type of success as "bureaucratic success."

Fourth, success to some analysts means that evidence indicates that they are able to look at things in the open sources and link them in ways others could not envision. The analyst would observe a situation, notice a trend, and take a position on a tough issue. The following descriptions are examples of good analysis written during the 1980s:

- The analyst's bosses didn't want a paper on the future of Lebanon written because it was a tough issue. When the analyst completed the paper, the director of the agency wanted to see it. The bosses fought among themselves to see who would take it to him. After reading it, the director wanted 20 copies to give to the Secretary of State.
- An analyst identified a high level of tension among the cultural groups living in Yugoslavia. The analyst reasoned that strong suppression was holding these cultures in check. When Tito dies, the analyst warned, "Look Out!" This example indicates that estimative studies should not be dismissed out of hand.[16]
- An analyst identified problems in African cities because of a certain mix of people living there. The paper predicted that similar problems would happen in suburbs as the suburbs began to get the same mix of people. As it turned out, the analyst was correct.

Fifth, a representative from one office defined success as a function of terrorist attacks. If no terrorist attacks happened, then they would consider themselves successful. However, terrorist attacks could potentially happen anytime, and if one happens, then the shop would consider itself unsuccessful.

Sixth, analysts in general put out a lot of paper and products in support of military "force protection," and to support the senior intelligence officers (J-2s) of the JCS and of the Unified Commands. DIA analysts consider themselves successful if their consumers change their behavior by doing things differently as a result of information provided.

Percent Successful

Study subjects clearly struggled to answer the question of how often they are successful. One subject said he had no answer: "Sometimes you will never know whether or not you were successful." He could confirm in any given case that no negative response had come from stakeholders, yet he could not be sure that the consumers considered their products successful. One subject said success for his office was at 90 percent. However, he could not elaborate.

---

[16] Perhaps the clearest exposition of how estimative intelligence can be accomplished in a way to discourage the work's being easily dismissed is provided by Isaac Ben-Israel in "Philosophy and Methodology of Intelligence: The Logic of Estimate Process," *Intelligence and National Security* 4, no. 4 (October 1989): 660-718.

One subject said that by his personal definition, all analyses were successful. His criterion for success was to go beyond the status quo, to clearly articulate views to real consumers, and to establish a feedback loop on utility of products. He admitted there was no readily accepted measure and no guidance concerning success. One way for an analyst to be successful was to get his work published. At least that would get his boss off his back for a certain amount of time! Still another subject said all products were in some sense successful. To be successful, he continued, it is important for someone to look at the products. One possible way to measure success is to count the number of electronic hits on a particular document on a database. If consumers are asking questions, then analysts can feel they are being helpful. An informal summary metric, then, is the measure of information flow out of the office.

Summary

Intelligence analysis supports DoD organizations and warfighter operations. Mission success is positive feedback from consumers or a successful completion of military operations. Bureaucratic success, on the other hand, results in more money to spend and more analysts to do the job. Analysts consider themselves successful if their consumers changed their behavior based on the information they provided to them. For example, successful analysts warn unit commanders of a possible terrorist attack and as a result of their work, the commander takes the appropriate steps to improve unit force protection.

STRATEGIES FOR SUCCESSFUL INTELLIGENCE ANALYSIS

"What is good intelligence analysis?"

Good or useful intelligence analysis may be best defined by its opposite. Bad intelligence does not specify what the threat is or how it will manifest itself. For example, the analyst may conclude there will be a 50 percent chance of a chemical weapons attack against the U.S. in the next 10 years. That conclusion is not meaningful or helpful to planners and users of intelligence.[17] In another example, the analyst may conclude that all ports are dangerous to U.S. ships. This analysis is impractical because ships have to use ports occasionally.

In positive terms, good intelligence analysis enlightens commanders or consumers. It doesn't necessarily have formal probabilities. Instead it communicates to the commander some level of likelihood. For example, if the commander implements plan X, then a terrorist group in this location is likely to react in the following manner. This information is

---

[17] Richards Heuer, 155, reproduces a table illustrating the different numerical probabilities that intelligence analysts and consumers associate with common word descriptions of probability. The message is that neither form of presentation expresses probability in a reliable fashion. The table appeared originally in Sherman Kent, "Words of Estimated Probability," in Donald P. Steury, ed., *Sherman Kent and the Board of National Estimates: Collected Essays* (CIA: Center for the Study of Intelligence, 1994), 133-137.

valuable to the commander because it gives him or her the opportunity to change plans based on the analysis. It enlightens the commander of the current situation. Good intelligence analysis takes a position on an issue. Some current intelligence products fail to say anything of substance because they use normative words such as "would," "could," "should," "will likely," "might, "may," and "can be." These products have limited value to the consumer. A remaining question is "How can intelligence products be made more useful?"

Good analysts use quantitative data when appropriate. Over time there has been a rise in the use of statistics in intelligence products. One subject observed that many years ago analysts rarely used statistics in their analysis. Then, some analysts used statistics, but they didn't write about it in their papers. He recognized statements made in the paper that would require use of a certain structured technique. He would call the author(s) to inquire about the technique. Usually, he was right. The author(s) had used the technique. After a while, some authors put the data in the appendix of their paper so others might replicate their work. Then, analysts began to put their statistical analysis in the text portion of their papers. These products became more like academic research papers than they had been in the past. Analysts tend to respond favorably to any form of rigor in intelligence products.

Richard K. Betts says intelligence failures are most often caused by decisionmakers who consume the products of intelligence service. The use of intelligence depends less on the bureaucracy than on intellect. Therefore, one can only get modest improvement by altering the analytic system.[18] Jay T. Young, on the other hand, sees barriers to more effective analysis that could be corrected by managerial, personnel, and training reform. He believes that an overhaul of the U.S. intelligence community's analysis effort can improve its effectiveness while reducing its overall size and cost.[19]

In government work, the applied nature of intelligence production would seem to offer the opportunity to develop and apply consistent measures of productivity and quality, just because the products are indeed used by specific consumers. If this is true, then there is room to bring "operations research" into play as well as the Baldrige criteria, to encourage the development and collection of carefully codified, surrogate measures of productivity and quality. Successful use of these tools does not remove from the manager the task of decisionmaking but rather it requires of him or her rather different kinds of decisions. In other words, using operations research tools provides managers with extra insight into their particular subject and hence leads them into much more difficult but fruitful areas. Consultants with scholarly backgrounds could come into the intelligence analysis work environment and make vast improvement to the intelligence analysis capability using such tools to assist them, in the author's opinion.

QUESTIONS FOR FUTURE RESEARCH

Our subjects offered the following questions for future study:

1. Does DIA prepare analysts for their work by acquainting them with the use of analytic tools? Does DIA provide adequate analysis training?

2. What are the implications of the substantial difference between the ideal way for doing analysis and the way DIA analysts actually do it? For example, data are often contradictory and vague. They do not point in any particular direction. Yet the analyst knows he must draw conclusions at the end of the study. Can anyone conclude anything from such data?

3. If you could have any tool (real or imaginary) to help do your analysis better, what would that tool be? For example, some people like having fancy graphics in their papers or as part of their analysis.

4. What attitudes characterize DIA analysts? Do DIA analysts have a tendency to be more receptive to collaboration, or more competitive than government analysts in other agencies?

NOT AN END, BUT A BEGINNING

This report does not represent the end of the intelligence analysis benchmarking study; rather it creates a platform for a wide range of beginnings. The approaches identified in this report will come to life by being shared, debated, and implemented in the context of Department of Defense and Intelligence Community realities. Then, where appropriate, they may be used and expanded upon. Intelligence analysts throughout the intelligence community can establish their own analysis networks and working groups to share their own best practices and lessons learned with each other.

	Benchmarking Offices				
	1	2	3	4	5
1. Does your office leadership support analysis process?	Y/N	Y	Y	Y	Y/N
Usually leader assigns tasks		Y	Y		
Usually analysts perform self-generated tasks	Y		Y		Y
Analysts usually respond to crises			Y	Y	
Little or no interaction during analysis process	Y	Y			Y
Some interaction if asked			Y	Y	
Tend to put products on electronic media	Y	Y			
Tend to put products in many different forms			Y	Y	Y
Formal feedback and coordination process at end	Y	Y	Y		Y
Informal feedback prior to finished product				Y	Y
2. Does your office have a written strategic plan?	N	N	N	N	N
Able to meet future capability challenges	N	Y	Y	Y/N	Y
Able to meet future issues challenges	N	Y	Y	Y/N	Y
Recorded lessons learned	N	N	Y/N	Y/N	N

	Benchmarking Offices				
	1	2	3	4	5
Use academic or professional sources	Y	Y	Y	Y	Y
3. Do your consumers support the analysis process?	Y/N	Y	Y	Y	Y
Requirements through COLISEUM & phone calls	Y	Y	Y	Y	Y
Little or no interaction during the analysis process	Y		Y		Y
Some informal interaction if appropriate		Y		Y	
Electronic publications and/or hard copies	Y	Y		Y	Y
Use multiple methods to market products			Y		
Little or no formal feedback	Y	Y	Y/N	Y/N	Y/N
4. Do you measure your analysis performance?	N	N	N	N	N
Lack of negative feedback from consumers			Y	Y	
Consumers find product useful			Y	Y	
Analysts show improvement over time		Y			
Don't track forecast accuracy					Y
Use or plan to use standard metrics	N	N	N	N	N
5. Do you have the right people and resources?	Y/N	Y	Y	Y	Y
Need to think across interdisciplinary boundaries	Y				
Need balance between computer skills & being SME		Y			Y
Need diverse mix of experiences			Y		Y
Need military operations experiences				Y	
Want analysts to develop and use toolbox	Y	Y	Y	Y	Y
6. Do you have a formal process for doing analysis?	N	N	N	N	N
Does informal process inhibit good analysis?	Y	Y/N	N	Y/N	
Use all information you can get		Y			
Use creativity to make-up for resource shortages	Y				
Use open-source data more	Y	Y	Y		
Information use is problem dependent			Y	Y	
Assess reliability of sources					Y
Do your analysts collaborate with other analysts?	N	Y/N	Y/N	Y	Y/N
7. Does your office make a positive contribution?	Y	Y	Y	Y	Y
Use consumer feedback		Y		Y	Y
Contribute to mission accomplishment		Y		Y	
Expand budget and grow workforce	Y				
Consumer changes behavior based on analysis			Y		
Successful most of time	Y	Y	Y	Y	

Responses to Interview Questions, by Office.

The purpose of the matrix is to summarize what was learned during the interviews. The author constructed the matrix after the interviews took place. All of the responses in a single column are directly related back to a specific interviewee. If the respondent referenced a specific item in his response and indicated yes or no to that item, then that response is recorded on the line related to that item in the matrix. If the box is blank, then the respondent did not refer to that item in his response. In other words, the author is uncertain what the respondent would say concerning the item in the matrix. The interviewer asked each subject the first question in the series of items directly. As a result, each box for the first question in the series of items is complete. No item in the matrix has a completely blank line because someone had to refer to the item in his response in order to get the item listed in the matrix. The matrix provides a frequency count of items mentioned in response to the topic being discussed.

ABOUT THE AUTHORS

David T. Moore is a senior technical leader at the National Security Agency. During 18 years of Intelligence Community service he has completed a variety of assignments in the Washington, DC area and overseas. These assignments enabled Mr. Moore to earn credentials in technical communications analysis, intelligence analysis, and intelligence research. He has created and taught intelligence analysis courses for NSA's National Cryptological School as well as for other government agencies. His most recent assignment was in the Art and Science of Analysis organization where his work focused on improving methodologies for intelligence analysis. He holds a B.A. in sociology/anthropology from Washington and Lee University and an M.S. in Strategic Intelligence from the Joint Military Intelligence College.

Lisa Krizan is a senior technical leader at the National Security Agency. A self-described "intelligence brat," she was introduced to the field by her father, Col. Allen J. Montecino, Jr., USAF, retired. Through diverse experience in intelligence support and production assignments, Ms. Krizan has earned credentials in technical communications analysis, intelligence research, and foreign language analysis, and has created and taught intelligence analysis courses for the National Cryptologic School. She received a B.S. degree in Business and Management from the University of Maryland and an M.S. in Strategic Intelligence from the Joint Military Intelligence College. Her master's thesis, "Benchmarking the Intelligence Process for the Private Sector" was the result of combining her studies in best business practices with her Intelligence Community work. Ms. Krizan is also the author of *Intelligence Essentials for Everyone*, published in June 1999 by the JMIC as Occasional Paper Number Six.

Mr. Moore and Ms. Krizan's current work on core competencies arose from their continuing advocacy for best practices in intelligence analysis, as members of the Art and Science of Analysis organization.

CORE COMPETENCIES FOR INTELLIGENCE ANALYSIS AT THE NATIONAL SECURITY AGENCY

David T. Moore and Lisa Krizan

Seekers of Wisdom first need sound intelligence.

— Heraclitus[1]

What makes an intelligence analyst successful in the profession? This question strikes at the heart of the National Foreign Intelligence Community's mission to provide actionable information to national leaders and decisionmakers. The imperative to answer this question stems from two types of pressures, external and internal. Externally, the component agencies face a world that demands responsiveness, agility, and flexibility. [2] Internally, they are charged with transforming outdated Cold War organizational structure, mentality, and methods. [3] This paper argues that, at least at the National Security Agency, identifying core analytic competencies that can be translated into managerial strategies is the surest way to ensure that intelligence analysts are successful.

As a member of the Intelligence Community (IC), the National Security Agency (NSA) is now pursuing an ambitious campaign to modernize its intelligence production mission and to mold its workforce accordingly.[4] Part of the modernization campaign is a new organizational model that places all intelligence analysts under the purview of an analytic deployment service. In this paradigm, individual analysts are assigned to specific production lines based on the capabilities of the former and the needs of the latter. However, for this model to work, staffers need to know what assets the analysts in the work force possess. Similarly, when intelligence agencies use precious few hiring allocations to bring in new intelligence analysts, they must maximize those opportunities, and only hire qualified personnel. But what is a qualified intelligence analyst?

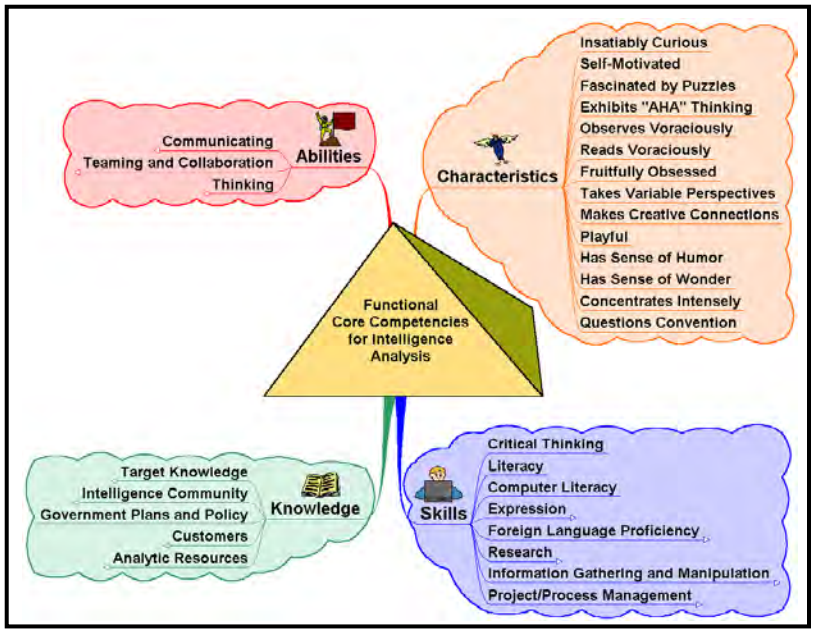
[3] George W. Bush, "National Security Presidential Directive 5," 9 May 2001. This directive instructs the Director of Central Intelligence to conduct a comprehensive review of U.S. intelligence. The order gives the DCI a broad mandate to "challenge the status quo."

[4] See URL: *http://www.nsa.gov/releases/nsa_new_enterprise_team_recommendations.pdf*, 1 October 1999, 16, accessed 3 November 2001. In this document, it is implicit that the Director, NSA recognizes that the agency's responsibility for the "production of signals intelligence" extends beyond "technical analysis of data" to "all-source" analysis of the context and implications of those data, especially but not exclusively for use within the agency itself.

In this paper the authors propose a set of functional core competencies for intelligence analysis, shown in the figure below, which provides a starting point for answering fundamental questions about the nature of ideal intelligence professionals, and how analysts who share these ideals can go about doing their work. Keeping in mind the complex nature of the threats to U.S. national security, we argue that the strategy for deploying intelligence analysts and for carrying out intelligence production must become more rigorous to keep pace with 21st Century foes, and to defeat them.



Functional core competencies for intelligence analysis..

The authors began exploring the art and science of intelligence analysis at their agency as part of a corporate initiative to add rigor to its analytic practice. Comments presented here on analytic thinking, its associated culture and processes, and its related technologies reflect conversations with intelligence experts both within and outside of government, and observation of analysts considered by their peers to be successful. We realized that definitions and descriptions of common characteristics, skills, knowledge, and abilities required for successful intelligence analysis were lacking, not only within our own agency but across the field of intelligence. We developed a set of functional core competencies for intelligence analysis that seem to apply across the intelligence profession in the government setting, not just for the types of analysis done at NSA. Our work has been reviewed by personnel in our agency as well as by individuals outside government, including academic experts on intelligence and

intelligence analysis.[5] They have made helpful suggestions for our model of functional core competencies.

Sherman Kent, who helped shape the national peacetime intelligence community, argues that intelligence requires its own literature. According to Kent, a key purpose of this literature is to advance the discipline of intelligence. Kent believed "[as] long as this discipline lacks a literature, its method, its vocabulary, its body of doctrine, and even its fundamental theory run the risk of never reaching full maturity."[6] Through the publication of articles on analysis and subsequent discussion, "original synthesis of all that has gone before" occurs.[7] In keeping with Kent's mandate to develop an intelligence literature that provokes discussion and further methodological development, we seek comment and further discussion among scholars of intelligence studies.

DEFINITIONS AND CONTEXT

> *Intelligence refers to information that meets the stated or understood needs of policymakers.... All intelligence is information; not all information is intelligence.*
>
> *— Mark Lowenthal*[8]

Intelligence is timely, actionable information that helps policymakers, decisionmakers, and military leaders perform their national security functions. The intelligence business itself depends on professional competencies, what John Gannon, former Chairman of the National Intelligence Council, refers to as "skills and expertise." He notes that "this means people—people in whom we will need to invest more to deal with the array of complex challenges we face over the next generation."[9] Analysis is the process by which

people transform information into intelligence. Ultimately, analysis leads to synthesis and effective persuasion, or, less pointedly, estimation.[10] It does so by breaking down large problems into a number of smaller ones, involving "close examination of related items of information to determine the extent to which they confirm, supplement, or contradict each other and thus to establish probabilities and relationships."[11]

Since the advent of the Information Age, "[collecting] information is less of a problem and verifying is more of one."[12] Thus the role of analysis becomes more vital as the supply of information available to consumers from every type of source, proven and unproven, multiplies exponentially. Intelligence analysts are more than merely another information source, more than collectors and couriers of information to consumers. Further,

> [the] images that are sometimes evoked of policymakers surfing the Net themselves, in direct touch with their own information sources, are very misleading. Most of the time, as [policymakers'] access to information multiplies, their need for processing, if not analysis, will go up. If collection is easier, selection will be harder.[13]

At its best, the results of intelligence analysis provide just the right information permitting national leaders "to make wise decisions—all presented with accuracy, timeliness, and clarity."[14] The intelligence provided must "contain hard-hitting, focused analysis relevant to current policy issues....Therefore, analysis of raw information has the most impact on the decisionmaker and [therefore] producing high-quality analytical product should be the highest priority for intelligence agencies."[15]

Intelligence is judged, then, on its usefulness. But what criteria define "useful?" Amos Kovacs asserts that useful intelligence makes a "difference" to policymakers.[16] There is also an expectation that intelligence should be unbiased, although analysts with concerns

about outcomes do influence the product by selecting which inputs to analyze.[17] Finally, as Michael Turner points out, analysts "from below" now join senior government officials in "setting the analytical agenda."[18] All policymakers and their subordinates are free to reject intelligence findings, no matter how persuasively argued they may be.

To say that policymakers may dismiss intelligence that doesn't support their presuppositions and policy objectives is to tell only half the story. There may be numerous reasons why policymakers do not accept intelligence. Gregory Treverton, former Vice-Chair of the National Intelligence Council, indicates that intelligence is ignored both when it brings inconvenient news and when it offers nothing new. In writing about the U.S. policy failures of the first Bush administration during the Balkan crisis, Treverton wonders, "If, in retrospect, the intelligence seems on the mark, did the policy failure derive from intelligence unheeded, or was the intelligence heeded but either not new or not really actionable?"[19]

Treverton adds that intelligence must anticipate the needs of policy. "By the time policy knows what it needs to know, it is usually too late for intelligence to respond by developing new sources or cranking up its analytic capacity."[20] A former policymaker himself, he asserts that intelligence is useful to policy at three stages during the life of an issue:

- If the policymakers are prescient, when the issue is just beginning; however there is likely to be little intelligence on the issue at that point.
- When the issue is "ripe for decision." Here policymakers want intelligence that permits alternatives to be considered; however, intelligence often is only able to provide background information necessary for understanding the issue.
- When the policymakers have made up their minds on the issue, but only if intelligence supports their view. They will be uninterested or even hostile when it does not support their view.[21]

These limitations notwithstanding, Treverton suggests that policymakers can and should establish a symbiotic relationship with the intelligence analysts who advise them:

> [If] you call them in, face to face, they will understand how much you know, and you'll have a chance to calibrate them. You'll learn more in fifteen minutes than you'd have imagined. And you'll also begin to target those analysts to your concerns and your sense of the issue.[22]

[20] Treverton, 179.

[21] Treverton, 183-185.

Similarly, the analyst has responsibilities to the policymaker. In commenting on this relationship, Sherman Kent asserts

> [intelligence] performs a service function. Its job is to see that the doers are generally well informed; its job is to stand behind them with a book opened at the right page to call their attention to the stubborn fact they may be neglecting, and—at their request—to analyze alternative courses without indicating choice.[23]

In Kent's view, the intelligence analyst is required to ensure, tenaciously, that policymakers view those "right" pages, even when they may not wish to do so.

MEASURING SUCCESS IN INTELLIGENCE ANALYSIS

> *Intelligence must be measured to be valued, so let us take the initiative and ask our management, [and] the users, to evaluate us and our products.*
>
> *— Jan P. Herring*[24]

Any observer can expect that a successful intelligence analyst will have certain personal characteristics that tend to foster dedication to the work and quality of results. Such an analyst will also have specific abilities, skills, and knowledge to perform intelligence work. Finally such an analyst will have productive relationships with consumers. But how can success in intelligence analysis be measured?

Measures of success have been based on job performance, including numbers of reports issued; volumes of raw data processed; or degree of consumer reliance on, or satisfaction with, products or services. However, these are measurements of outcome, only one facet of success. When analysis follows a rigorous process that allows an analyst to "add value" to information, and that results in timely, actionable intelligence used by consumers, then it may be judged successful. Thus, an assessment of success may be made by balancing measures of two basic criteria: intelligence process (processing and adding value to information) and intelligence product (meeting consumer needs). As depicted in the figure below, each can keep the other in balance, curbing any tendency toward "analysis paralysis"[25] on one side, and countering an assembly-line mindset on the other.

An intelligence evaluation scheme.

Intelligence Process

Successful intelligence analysis is a holistic process involving both "art" and "science." Intuitive abilities, inherent aptitudes, rigorously applied skills, and acquired knowledge together enable analysts to work problems in a multidimensional manner, thereby avoiding the pitfalls of both scientism and adventurism. The former occurs when scientific methodology is excessively relied upon to reveal the "truth"; the latter occurs when "inspiration [is] unsupported by rigorous analysis."[26]

[25] One potential pitfall of the analytic profession is the tendency to pursue analysis for its own sake, continually seeking more information, becoming locked into analysis and failing to reach conclusions. Rigorous methodology that emphasizes adding value to information and making it actionable for a specific consumer can break the cycle of such paralysis.

[26] Steven R. Mann, "Chaos Theory and Strategic Thought," *Parameters* 22, no. 3 (Autumn 1992): 67. Quoted in MSgt Robert D. Folker, Jr., *Intelligence Analysis in Theater Joint Intelligence Centers: An Experiment in Applying Structured Methods*, Occasional Paper Number Seven (Washington DC: Joint Military Intelligence College, 2000), 13.

A vital contributor to the analytic process is a spirit of competition, both within an intelligence-producing agency and especially between intelligence agencies. There is a tendency for analysts working together to develop a common mindset. This trap occurs typically when analysts fail to question their assumptions about their role in the intelligence process and about the target. The Council on Foreign Relations' independent task force on the future of U.S. intelligence recommends that "competitive or redundant analysis be encouraged" precisely for these reasons.[27]

Successful analysis adds value—to the information itself, to institutional knowledge, to fellow intelligence professionals, to the process, and to the institution or unit itself—in terms of reputation and the degree to which good analytic practices endure despite changes in target, consumer, and personnel. Successful analysts are those whose work, whenever possible goes to the level of making judgments or estimating. The analysts' risks in doing so are carefully calculated, for successful analysts rely on critical thinking. Nor do successful analysts settle for the first answer their analysis reveals. Rather they employ rigorous methods to push beyond the obvious conclusions. However, tendencies toward arrogance in trend-spotting analysis are tempered by self-awareness of biases and assumptions, strengths and weaknesses. And most importantly, successful analysts collaborate at every opportunity. Such measures ensure that analytic results, even if controversial, remain grounded in reality.

What role does management play in ensuring analytic success? First and foremost, management effectively uses financial and political capital to ensure that analysts have access to consumers, and to the resources they require to answer those consumers' intelligence needs. This includes the organization of the work itself, allocation of materiel and personnel, and coordination with consumers and other producers. When management is successful, the analyst has the necessary tools and the correct information for successful intelligence analysis. Good morale among analytic personnel becomes an indicator of effective management. A good understanding of the unit's mission and the analysts' own satisfaction with his or her performance naturally produces a feeling of empowerment and a belief that the organization places great value on analytic talent.

Intelligence Product

The products of successful analysis convey intelligence that meets or anticipates the consumer's needs; these products reveal analytic conclusions, not the methods used to derive them. Intelligence products are successful if they arm the decisionmaker, policymaker or military leader with the information and context—the answers—needed to win on his or her playing field. Such intelligence enables consumers to be more effective by making them smarter than they were before, smarter than the people they play with, and smarter than those they play against. Successful intelligence enables consumers to outwit

---

[27] Council on Foreign Relations, *Making Intelligence Smarter: The Future of U.S. Intelligence: A Report of an Independent Task Force*, 11, URL: *http://www.fas.org/irp/efr.html*, accessed 4 June 2001.

opponents, protect U.S. persons, bring aid to the nation's allies, or to judge levels of trust. It does so by revealing decision points, actions or choices available to a consumer, and the implications of choosing one over another.

Yet, consumers rarely acknowledge explicitly the role that good intelligence plays in their own success. While they may be quick to bring intelligence failures to the attention of the producing organization, consumers do not always give feedback on successful outcomes enabled by intelligence. Thus intelligence analysts and their management historically have looked within the production organization for ways to measure success, falling into the trap of "bean-counting." But there is a better way.

Readiness: Intelligence systems must be responsive to existing and contingent intelligence requirements of consumers at all levels.

Timeliness: Intelligence must be delivered while the content is still actionable under the consumer's circumstances.

Accuracy: All sources and data must be evaluated for the possibility of technical error, misperception, and hostile efforts to mislead.

Objectivity: All judgments must be evaluated for the possibility of deliberate distortions and manipulations due to self-interest.

Usability: All intelligence output must be in a form that facilitates ready comprehension and immediate application. Intelligence products must be compatible with the consumer's capabilities for receiving, manipulating, protecting, and storing the product.

Relevance: Information must be selected and organized for its applicability to a consumer's requirements, with potential consequences and significance of the information made explicit to the consumer's circumstances.

Measures of success for intelligence products[28]

Six "underlying ideas or core values" for intelligence analysis, identified by William Brei for operational-level intelligence, and shown in the figure above, establish the analyst's "essential work processes."[29] Since they are defined in terms of the consumer, they also can be used as a checklist to rate the quality of products provided to the consumer. Brei asserts that they "provide specific qualitative objectives for managers and leaders, and a framework for standards against which intelligence services should be judged."[30] While qualitative feedback from consumers aids evaluation of some of these objectives, the absence of consumer input does not prevent their being used in self-evaluation.

---

[28] William S. Brei, Captain, USAF, *Getting Intelligence Right: The Power of Logical Procedure*, Occasional Paper Number Two (Washington DC: Joint Military Intelligence College, 1996), 6.

[29] Brei, 6.

[30] Brei, 5.

The principles of Readiness and Timeliness evaluate the intelligence service's basic ability to perform intelligence production. These two principles are limiting factors affecting what the producer can do to "achieve accurate data, objective judgments, usable formats, and relevant products."[31] Once production Readiness and Timeliness are evaluated, the other four of Brei's fundamental principles then can be arranged in a checklist or a series of questions about intelligence products. Typical questions might include:

- Was the reported intelligence accurate? (*Accuracy*)
- Are there any distortions in the reported judgments? (*Objectivity*)
- Is the reported intelligence actionable? Does it facilitate ready comprehension? (*Usability*)
- Does it support the consumer's mission? Is it applicable to the consumer's requirements? Has its significance been made explicit? (*Relevance*)

These four principles also overlap, and poor quality in one can affect the quality of another. Brei asserts that accurate data provide the foundation for subsequent objective judgments, and the expression of objective judgments in a usable form provides much of the basis of a relevant product. Thus, unverified data cannot only cost an intelligence product its Accuracy, but also damage its Relevance to the customer.[32]

Although Brei's principles do not require consumer input in the evaluation of intelligence, the process of measuring the effectiveness of a product is enhanced with consumer participation. Brei suggests: "[L]isten to their complaints."[33] However, this does not guarantee that the responses will address the product of interest. Rather, the analyst needs to ask directly for specific feedback from the consumer. This is most effective if the analysts and managers have collaborative relationships with consumers. Lacking such relationships, producers may attach survey questions to intelligence products, prompting consumers to respond regarding the utility of the service provided. Admittedly, this elicitation may be disturbing, as consumers are more likely to respond when they are unhappy with the product than when they are pleased. Further, regardless of the assessment of worth or value, some consumers will never respond.

Brei's principles provide a means for evaluating a given intelligence product based on the meaning it conveys and the value of that intelligence to the consumer. His approach, when combined with an "insider's" view of the intelligence production process, analytic methods and personnel management practices, makes a comprehensive evaluation of intelligence analysis appear possible. In the sections to follow, the concept of core competencies for intelligence analysis is developed, from which may emerge some useful suggestions for operationalizing the concept of an "art and science" of intelligence analysis.

[33] Brei, 5.

CHARACTERISTICS OF SUCCESSFUL INTELLIGENCE ANALYSTS

> A sophisticated intelligence analyst is one who is steeped in the history and culture of a region, has lifelong interest in the area, and approaches the study of the region as a professional responsibility, and probably as an avocation as well.
>
> *— Ronald D. Garst and Max L. Gross*[34]

Who are the most successful intelligence analysts? What makes them successful? In setting forth the functional core competencies for successful intelligence analysis we observe there are characteristics which, while not necessary for successful intelligence analysis per se, do seem to be associated with analysts considered to be the most successful at their trade.[35] It should be noted, however, that not all successful analysts exhibit all these characteristics. The characteristics highlighted in the graphic below are a representative superset, and while individual analysts do seem to share certain characteristics, they do not share all of them in equal measure.

Probably the most indispensable characteristics of successful intelligence analysts are high self-motivation and insatiable curiosity. Analysts want to know everything they can about the objects under their scrutiny. Reading and observing voraciously, they ferret out every possible piece of information and demonstrate a sense of wonder about what they discover. As new fragments appear, novel connections are discovered between the new and older information as a result of intense concentration leading to epiphanous moments of "aha" thinking. The most successful analysts tend to enjoy their work—"It's play, not work." Indeed, they often will stay late at the office to pursue a thorny problem or an engaging line of reasoning.

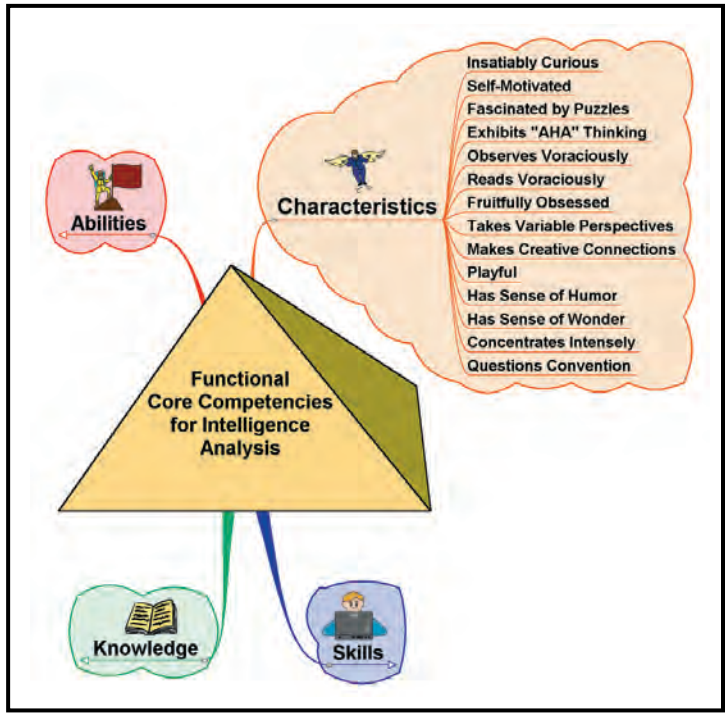
These characteristics also describe the values, standards, and beliefs of a dynamic, living analytic culture. As such, they may be used as preliminary indicators during the hiring process to identify prospective employees. A person with many of the characteristics listed may be predisposed to being a successful analyst, if the appropriate skills, abilities, and

---

[34] Ronald D. Garst and Max L. Gross, "On Becoming an Intelligence Analyst," *Defense Intelligence Journal* 6, no. 2 (Fall 1997): 55.

[35] The authors base their establishment of core competencies primarily on two initiatives taken as NSA in recent years. The first is an extensive formal job analysis conducted by industrial psychologists in the mid-1990s. Identification of some of the knowledge areas, skills and abilities required for intelligence analysis came out of that study, which is cited extensively in Lisa Krizan, *Intelligence Essentials for Everyone*, JMIC Occasional Paper Number Six (Washington, DC: JMIC, 1999). The second initiative is the ongoing work of the Arts and Science of Analysis research organization established at NSA in early 2000. As members of that organization, the authors participated in studies and interviews yielding insights into the behaviors applied by NSA intelligence analysts on the job.

necessary knowledge to perform the work are also present. Employee orientation programs that acknowledge these characteristics may be most successful in initiating new employees into the analytic culture. When personal characteristics are embodied in compelling "war stories" told by mentors and peers, they can reinforce the cultural values of the agency, building corporate loyalty by reinforcing the sense of membership.



Characteristics of successful intelligence analysts.

Indoctrination into a particular analytic culture can also have negative implications. Although it may build loyalty, enhance behaviors, and inculcate values, it can also prevent objective analysis by reinforcing "group" thought patterns and analytic methodologies. The culture must allow for "a spirit of creativity to emerge and prosper."[36]

These personal characteristics of successful intelligence analysts are but one factor among many in influencing the success of intelligence process and product. Abilities and skills provide the tools for performing good intelligence analysis. Knowledge provides raw material for analysis as well as for an appreciation of the context and relevance of information.

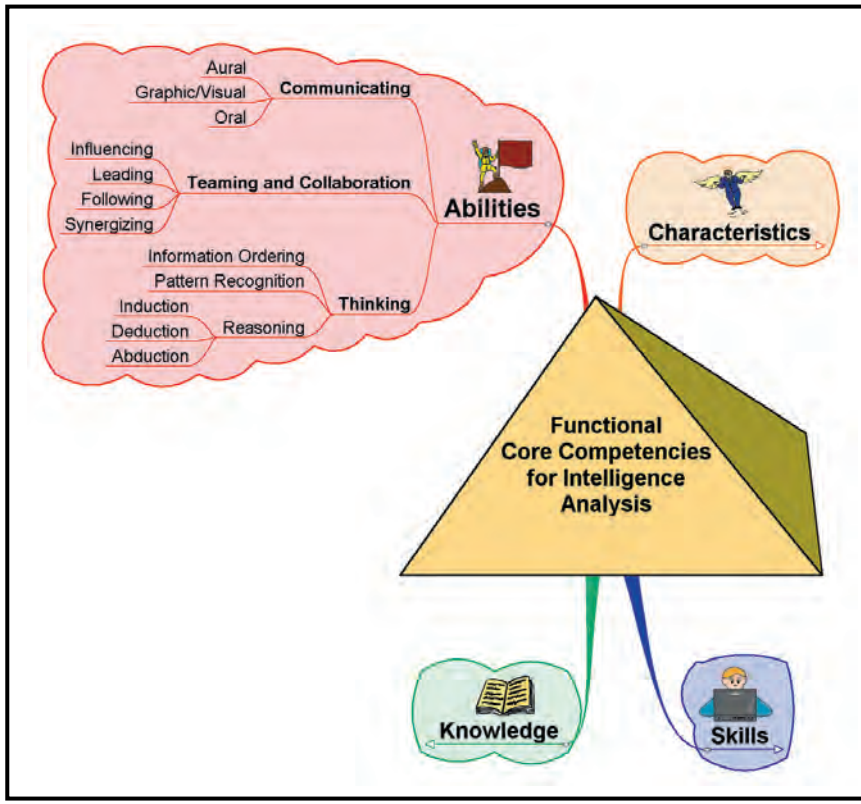
ABILITIES REQUIRED FOR INTELLIGENCE ANALYSIS

The competent intelligence analyst must have a unique combination of talents.
— Ronald D. Garst and Max L. Gross[37]

Abilities arise from aptitudes that can develop from an individual's innate, natural characteristics or talents. Although aptitudes may largely be determined by a person's genetic background, they may also be enhanced through training.[38] We find the abilities shown here to be necessary for intelligence analysis.



Abilities required for successful intelligence analysis.

[37] Garst and Gross, 47.

[38] Conversation with Dr. S. Alenka Brown-Vanhoozer, Director, Center for Cognitive Processing Technology, Advanced Computing Technologies, BWXT Y-12, Oak Ridge, TN, April 2001.

Communicating

Almost all animate life communicates, but humans are unique in possessing a brain structured to permit abstract, symbolic communication. Three communication abilities appear necessary for various aspects of intelligence analysis:[39]

- **Aural:** The ability to hear, listen to, and understand spoken words and sentences is one of the essential means humans employ to take in information. Aural ability can be improved through specific techniques of "active listening." This ability greatly enhances analysts' performance of certain technical tasks, and their interaction with consumers, peers and managers.
- **Graphic/Visual:** The ability to see, view, and understand graphic/visual symbols developed early in human history. Along with the ability to interpret symbols came the ability to present information in a graphic or visual manner so that others could understand. Even in speech, a majority of human communication remains non-verbal (that is, graphic or visual).[40] Developing this ability allows for effective graphical presentation of intelligence, which can dramatically heighten its impact.
- **Oral:** The ability to communicate via spoken words and sentences so that others will understand is unique to humans. While the physical capability has evolved over eons, key developmental milestones occur during the first years of life. The development of oral and aural abilities are closely linked. Effective oral communication directly affects the intelligence analyst's credibility.

Teaming and Collaboration

Humans are a social species, and associated abilities have evolved with human development. Teaming and collaborating were essential when proto-humans moved from the relative safety of the trees onto the more dangerous plains of Africa. Their collective lives depended on social abilities to solve problems and overcome threats. While today's threats have changed, humans retain these abilities in order to live and work together.

Teaming and collaboration abilities enhance intelligence analysis, since the analyst's relationship with consumers, peers, subordinates, and supervisors shapes the intelligence production process. Formalized means of enhancing all these abilities can lead intelligence professionals to considerably greater effectiveness as analysts and leaders of analysts. This is why the Director of Central Intelligence has indicated that collaboration is a cornerstone of strategic intelligence.[41] A collaborative environment also minimizes the likelihood of intelligence failures. For example, had imagery analysts communicated

[39] We do not suggest that individuals lacking one or more of these abilities due to physical impairment would be unable to perform intelligence analysis. However, we do suggest that in the absence of corrective technologies, an impaired person may not be able to perform certain functions of analysis or production that depend on the impaired ability.

[40] Conversation with Dr. S. Alenka Brown-Vanhoozer, April 2001.

[41] Director of Central Intelligence National Security Advisory Panel, accessed 1 June 2001.

effectively with their counterpart area analysts in 1999, the "Yugoslav War Office" bombed by U.S. forces that spring may have been identified as the Chinese Embassy in time to avoid the resultant tragedy.[42]

We identify four distinct teaming abilities, to show the complexity of the concept. Typically, formal training programs address leadership abilities only in the context of the management function; here, we focus on the analysis process itself.

- **Influencing:** Those with this ability effectively and positively influence superiors, peers, and subordinates in intelligence work. Analysts often need to persuade others that their methods and conclusions are valid, and they often need to leverage additional resources. The ability to influence determines the level of success they will have in these areas.
- **Leading:** Those who are more senior, more skilled, and more successful in intelligence analysis have an obligation to lead, that is, to direct others and serve as role models. The ability to lead involves working with and through others to produce desired business outcomes. Thus, developing leadership abilities enhances the field of intelligence analysis.
- **Following:** Almost every grouping of humans has a leader. Everyone else is a follower. Analysts must enhance their abilities to work within a team, taking direction, and acting on it.
- **Synergizing:** Drawing on the other three teaming abilities, players in the intelligence process cooperate to achieve a common goal, the value of which is greater than they could achieve when working alone.

Thinking

> As our species designation—*sapiens*—suggests, the defining attribute of human beings is an unparalleled cognitive ability. We think differently from all other creatures on earth, and we can share those thoughts with one another in ways that no other species even approaches.
>
> — *Terence W. Deacon, The Symbolic Species.*[43]

Intelligence analysis is primarily a thinking process; it depends upon cognitive functions that evolved in humans long before the appearance of language.[44] The personal characteristics of intelligence analysts are manifested in behaviors that reflect thinking and/or the inherent drive to think. Our national survival may depend on having better developed thinking abilities than our opponents. Three basic thinking abilities are

[42] Gregory Treverton, 10.

[44] Keith Devlin, "The Role of Conceptual Structure in Human Evolution" in Bernhard Ganter and Guy W. Mineau, eds, *Conceptual Structures: Logical, Linguistic, and Computational Issues*, 8th International Conference on Conceptual Structures (Berlin: Springier Verlag, 2000), 1.

required for intelligence analysis. Given the limitations imposed by each one of them, only simultaneous application of all three may yield successful intelligence analysis.

- **Information Ordering:** This ability involves following previously defined rules or sets of rules to arrange data in a meaningful order. In the context of intelligence analysis, this ability allows people, often with the assistance of technology, to arrange information in ways that permit analysis, synthesis, and extraction of meaning. The arrangement of information according to certain learned rules leads the analyst to make conclusions and disseminate them as intelligence. A danger arises, however, in that such ordering is inherently limiting—the analyst may not look for alternative explanations because the known rules lead to a ready conclusion.
- **Pattern Recognition:** Humans detect patterns and impose patterns on apparently random entities and events in order to understand them, often doing this without being aware of it. Stellar constellations are examples of imposed patterns, while criminal behavior analysis is an example of pattern detection. Intelligence analysts impose or detect patterns to identify what targets are doing, and thereby to extrapolate what they will do in the future. Pattern recognition lets analysts separate "the important from the less important, even the trivial, and to conceptualize a degree of order out of apparent chaos."[45] However, imposing or seeking patterns can introduce bias. Analysts may impose culturally defined patterns on random aggregates rather than recognize inherent patterns, thereby misinterpreting the phenomena in question.
- **Reasoning:** The ability to reason is what permits humans to process information and formulate explanations, to assign meaning to observed phenomena. It is by reasoning that analysts transform information into intelligence, in these three ways:
  1. **Induction:** Inductive reasoning combines separate fragments of information, or specific answers to problems, to form general rules or conclusions. For example, using induction, a child learns to associate the color red with heat and heat with pain, and then to generalize these associations to new situations.[46] Rigorous induction depends upon demonstrating the validity of causal relationships between observed phenomena, not merely associating them with each other.

  2. **Deduction:** Deductive reasoning applies general rules to specific problems to arrive at conclusions. Analysts begin with a set of rules and use them as a basis for interpreting information. For example, an analyst who follows the nuclear weapons program of a country might notice that a characteristic series of events preceded the last nuclear weapons test. Upon seeing evidence that those same events are occurring again, the analyst might deduce that a second nuclear test is imminent.[47] However, this conclusion would be made cautiously, since deduction works best in

[47] Clauser and Weir, 81.

closed systems such as mathematics, making it of limited use in forecasting human behavior.

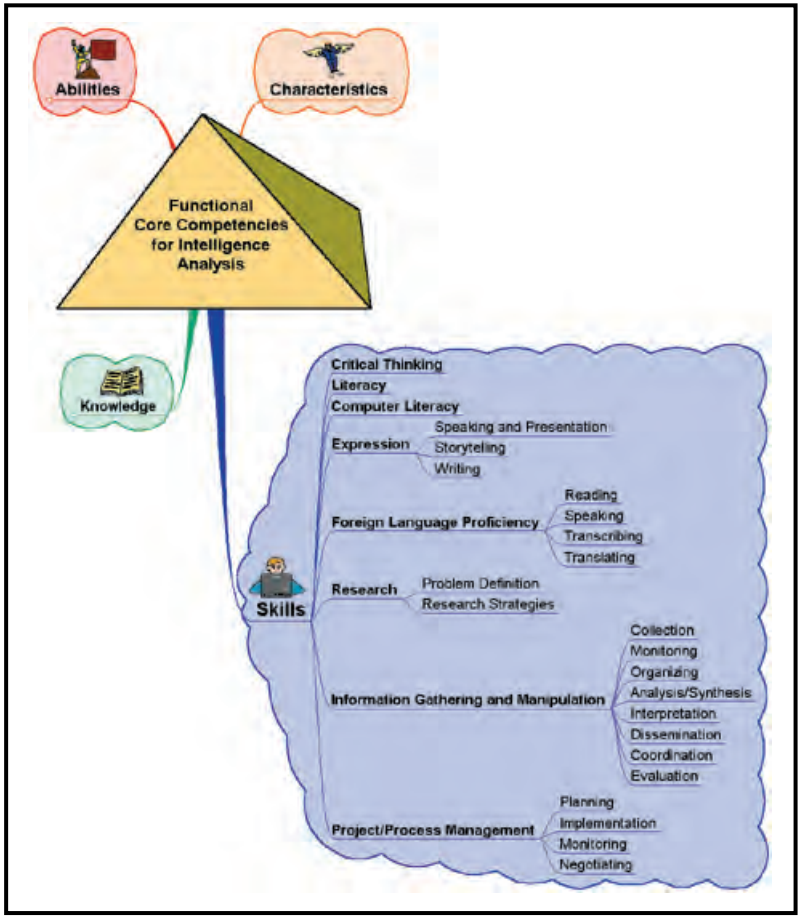
3. **Abduction:** Abductive reasoning describes the thought process that accompanies "insight" or intuition. When the information does not match that expected, the analyst asks "why?," thereby generating novel hypotheses to explain given evidence that does not readily suggest a familiar explanation. For example, given two shipping manifests, one showing oranges and lemons being shipped from Venezuela to Florida, and the other showing carnations being shipped from Delaware to Colombia, abductive reasoning is what enables the analyst to take an analytic leap and ask, "Why is citrus fruit being sent to the worldwide capital of citrus farming, while carnations are being sent to the world's primary exporter of that product? What is really going on here?" Thus, abduction relies on the analyst's preparation and experience to suggest possible explanations that must then be tested. Abduction generates new research questions rather than solutions.[48]

Is There a Logic of Exploratory Data Analysis," Paper presented at the annual meeting of the American Education Research Association, New Orleans, LA, April 1994, URL: *http://seamonkey.ed.asu.edu/~behrens/asu/reports/Peirce/Logic_of_EDA.html*, accessed 6 June 2001.

SKILLS REQUIRED FOR INTELLIGENCE ANALYSIS

Any institution that relies on professionals for success and seeks to maintain an authentic learning climate for individual growth must require its members to read (to gain knowledge and insight), research (to learn how to ask good questions and find defensible answers), discuss (to appreciate opposing views and subject their own to rigorous debate), and write (to structure arguments and articulate them clearly and coherently).

— Gregory D. Foster[49]



Skills required for successful intelligence analysis.

[49] Gregory D. Foster, "Research, Writing, and the Mind of the Strategist," *Joint Force Quarterly* 11 (Spring 1996): 74-79.

Whereas aptitudes and related abilities probably stem from an analyst's genetic makeup, a skill represents learned expertise or proficiency based on a particular ability or set of abilities. At least eight types of skills, shown here, are required for successful intelligence analysis.

Critical Thinking

It is by thinking that analysts transform information into intelligence. Critical thinking is the cognitive skill applied to make that transformation. Critical thinking can be defined as

> [An] intellectually disciplined process of actively and skillfully conceptualizing, applying, analyzing, synthesizing, and/or evaluating information gathered from, or generated by, observation, experience, reflection, reasoning, or communication, as a guide to belief and action....Thinking about [our] thinking while [we're] thinking in order to make [our] thinking better.[50]

> There is a clear need to educate and train intelligence analysts to use their minds...[Only] by raising their awareness can the intelligence unit be assured that the analysts will avoid the traps in being slave to conformist thought, precedent and imposed cultural values—all enemies of objective analysis.[51]

An ordered thinking process requires careful judgments or judicious evaluations leading to defensible conclusions that provide an audit trail. When the results of analysis are controversial, subject to alternate interpretations, or possibly wrong, this audit trail can prove essential in defending the process used to reach the conclusions.

Effective critical thinking also includes routine, systematic questioning of the premises upon which decisions are based. Without critical thinking, current beliefs and methods are not questioned, as long as they appear to produce results that can be reasonably explained. Yet they can prevent analysts from making alternative interpretations. Writing rhetorically, Gregory Treverton asks, "If intelligence doesn't challenge prevailing mind-sets, what good is it?"[52]

Intelligence failure can be the result when alternative premises are ignored, as happened from the mid-1970s to the mid-1990s in Sweden. During that time, the Swedish Navy expended considerable effort and ordnance attempting to "destroy" intruding Soviet submarines. Swedish naval analysts (and others) repeatedly acknowledged failure, rationalizing it as a "David versus Goliath" contest: Sweden's tiny navy was no match for the

---

[51] McDowell, 216.

[52] Treverton, 5.

technologically advanced Soviet submarine fleet. It was not until 1995 that Swedish defense chief Owe Wiktorin revealed the truth; detected intruders previously believed to be submarines were in fact minks swimming in the waters off the Swedish coast. Blinded by the premise that the Soviets wanted to make war against Sweden, the navy had ignored this possible explanation for their failure to destroy "enemy" submarines, despite the fact that the alternative premise had been suggested as early as 1987.[53] An obvious conclusion from this story is that corporate mechanisms for questioning analytic premises could have resolved this intelligence question nearly a decade earlier. The lesson for present-day intelligence analysts is clear: corporate processes for intelligence analysis must allow for, and indeed, institutionalize, the questioning of premises.

Literacy

Intelligence analysis requires the reading and comprehension of written sentences and paragraphs, often in multiple languages, at many points in the intelligence process. Prospective intelligence analysts must be literate in order to perform their work at the most basic level, making this skill a prerequisite for employment. Literacy skills are crucial for understanding the target, the consumer and the intelligence process. Literacy is also necessary for conducting research.

Computer Literacy

It is a given that in the 21st Century, the computer is an essential tool for intelligence analysis. Today, analysts must be highly skilled in the use of computers themselves and in the use of software that will aid analysis. Word processing, spreadsheet, and presentation programs, as well as specific programs that assist at all stages of the analytic process, are the essential tools that can bolster success. However, tools themselves do not provide "truth" (if such can be said to exist in the intelligence analysis context). Rather, these tools for manipulation, correlation, and presentation of information are a means to an end: the production of intelligence. An analyst's skillful use of them hastens arrival at that end.

The fact that analysts are faced with massive volumes of data also makes use of selection and filtering tools essential. The analyst depends on these tools to make a "first cut" on the collected information. The tools are used to filter non-relevant information items and retain only those items that are pertinent to the issue being analyzed.

Expression

The results of analysis are useless if they are poorly presented. "The capable analyst must be competent and experienced in presenting analysis both orally and in writing."[54] Effective oral and written skills are therefore essential for the intelligence analyst. Fail-

[53] William H. Starbuck, "Unlearning Ineffective or Obsolete Technologies," *International Journal of Technology Management* 11, nos. 7/8 (Winter 1996): 725-726.

[54] Garst and Gross, 49.

ures of intelligence can indeed occur when the results of analysis are inadequately presented. For example, Berkowitz and Goodman note that lengthy daily or weekly briefings may be inadequate means for informing officials, regardless of their content. Warnings go "unheard because the officials [find] the hour-long briefings to be an inefficient use of their time and [stop] attending."[55] Similarly, they conclude that inadequate intelligence reporting of unrest in Iran in 1978 contributed to the U.S. Intelligence Community's failure to predict the fall of the Shah.[56] These examples also make it clear that whichever method of informing policymakers is selected, the resultant products must be concise, tailored ones that masterfully present the intelligence to the intended consumer or in the consumer's frame of reference.

- **Speaking and Presentation:** The oral presentation of information, particularly to senior officials, otherwise known as "briefing," and often accompanied by visual aids, allows an effective analyst to tailor both the content and delivery method to the consumer's abilities or predilections. The briefing's timing, level of detail, format and tone may all be matched to the consumer. In particular, key facts and conclusions come at the beginning of the exchange and determine its organization.[57] Effective briefing goes beyond these technical considerations. The heart of the intelligence briefing is the presenter's relationship with the consumer, thus, "the essence of briefing is not simply the projection of information, but rather the art of promoting understanding between individuals."[58] Through the briefing process, the presenter puts information into the consumer's frame of reference, making clear the possibilities for decision, action and consequences, thereby creating intelligence.
- **Storytelling:** While well-honed speaking and presentation skills allow effective intelligence dissemination, well developed storytelling skills ensure that intelligence is convincingly conveyed. Storytelling involves more than just creating the story. Its power lies in the way the story is told. In the words of transformational storytelling expert Stephen Denning, "[the] look of the eye, the intonation of the voice, the way the body is held, the import of a subtle pause, and [the storyteller's] own response to the audience's responses—all these aspects ... make an immense contribution to the meaning of the story for [the] audience."[59] Too often the consumer does not understand a poorly told but important story buried in a sophisticated presentation, making storytelling an essential skill for intelligence professionals.

[59] Stephen Denning, *The Springboard: How Storytelling Ignites Action in Knowledge-Era Organizations* (Boston, MA: Butterworth Heineman, 2001), xxii.

Storytelling in this context is not about fiction; it is not about "once upon a time." Rather, intelligence storytelling involves creating scenarios and alternative futures for consumers. Intelligence assessments that provide a variety of possible outcomes, recounted in considerable detail, can give the consumer clues to the most effective policies or strategies. An example of varying analytic outcomes expressed as scenarios can be found in the National Intelligence Council's *Global Trends 2015*. Four alternative futures for the next 15 years are outlined in addition to the principal scenario. These alternatives suggest a variety of possible outcomes based on population trends, resource availability, technological advances, economic conditions, ethnic identity and governance, and local and regional conflicts. The significance for the policymaker is that the future is fluid.[60] While all the alternatives are possible, certain political and strategic decisions could influence which outcome is most likely to occur. Being prepared for various outcomes enables the policymaker to be proactive and to respond appropriately as events unfold.

- **Writing:** The basic vehicle by which intelligence historically has been purveyed is the written report. At the beginning of the 21st Century this remains the case. Yet many contemporary intelligence analysts lack this basic skill, and improvement "of writing skills, basic though it may be, is often required as part of becoming a competent intelligence analyst."[61]

Foreign Language Proficiency

To be truly successful, analysts must be proficient in the language(s) employed by the subjects of their analysis. Without such proficiency they cannot completely comprehend target intentions and actions. When analysts misunderstand their targets, the intelligence they provide to consumers thus will be inaccurate or misleading.

Once upon a time, many intelligence analysts could rely upon the skills of professional linguists for translation of target information. Now this luxury has become unavailable to all but a few intelligence analysts working the largest, best-funded intelligence problems.[62] Foreign language proficiency has thus become a necessity for all who perform intelligence analysis.

If budget and personnel cuts are insufficient reason for analysts to have foreign language proficiency, changes in intelligence targets provide additional arguments for its necessity. Although targets of interest have traditionally used their native language(s) for internal communications, many employed non-native languages such as English for international communications and publications. This was especially true of the first decade of

[60] National Intelligence Council, 2000, 83-85.

[61] Berkowitz and Goodman, 54.

[62] For one view of the staffing cuts at the National Security Agency, see Mathew M. Aid, "The Time of Troubles: The US National Security Agency in the Twenty-First Century," *Intelligence and National Security* 15, no. 3, (Autumn 2000): 5-9.

the popular use of the Internet, when English was the *lingua franca* of that medium. However, this is changing. The use of native languages in international communications is growing both on and off the Internet. Thus, proficiency in non-English languages is necessary for analysis of information, approximately 80 percent of which "is *not* secret, is *not* online, is *not* in English, is *not* government associated, but is in the private sector, and is *not* available locally to the analyst."[63]

Furthermore, foreign language proficiency provides more than just a translation of non-English materials. The structure of a target's language and that target's culture are closely related. One well-known theory of this relationship, by Edward Sapir and Benjamin Whorf, posits that "language is a force in its own right and it affects how individuals in a society conceive and perceive reality."[64] Thus concepts essential to understanding the target are communicated in a context that goes beyond simplistic translation.

For example, the German terms *Gemeinschaft* and *Gesellschaft* both translate into English as "community." Yet this translation ignores the interpersonal nature of the relationship among the members of the first type of community, and the business context of the second. An analyst relying on translation by another might not be aware of the nature of the "community" in the material being analyzed.

In Somali there are two pronouns for the English "we." A speaker of Somali uses the pronoun *annagu* when referring to the speaker and someone other than the person being addressed. Conversely, the use of the pronoun *innagu* includes the person being addressed. So if someone says in English, "We are going to the movie," the question of "Who is 'we'?" must be asked. In Somali there is no doubt: If annagu are going to the movies, the person being addressed is not going; if innagu are going to the movies then the person being addressed is going. Again, an analyst depending on a translation into English must rely on the translator to convey that contextual information. This inclusion or exclusion from a group can be quite significant. There is a considerable difference between "annagu are going to blow up the embassy," and "innagu are going to blow up the embassy." This distinction is especially significant to the intelligence analyst in this case, even if the implications for the embassy remain the same.

Even the distinction between intelligence and information is language-derived. The Sinitic term *qingbao* refers to a concept that can be understood either as "information" or "intelligence."[65] This latter distinction is a "Western one not shared by East Asian languages or presumably their speakers," according to the Foreign Broadcast Information

[63] Robert David Steele, "The New Craft of Intelligence: an Alternative Approach Oriented to the Public," Conference on The Future of Intelligence in the 21st Century, Priverno, Italy, 14-16 February 2001. The quote is from Steele's remarks and is not in his published version of the paper. Clarification was made via personal email communication, 18 May 2001. Because the conference operated under the "Chatham House Rule," Mr. Steele is quoted with permission.

[65] *Concise English-Chinese/Chinese-English Dictionary*, 2nd ed. (Oxford: Oxford University Press, 1999), 363.

Service editor of the Chinese intelligence collection manual, *Guofang Keji Qingbaoyuan ji Houqu Jishu*.[66] Context must determine the translation, and an analyst lacking foreign language skills must trust the linguist to correctly understand that context. The expertise required for that understanding might render the linguist a better intelligence analyst than the original analyst. This begs the question: "Is such duplication of personnel affordable?"

We recognize that certain forms of technical analysis have previously not required foreign language proficiency. We suggest, however, that it is not truly known, nor can we know, whether foreign language proficiency would have enhanced that analysis. Some technical metadata analysis clearly does not require language proficiency. However, analysis of other types of metadata may indeed require foreign language proficiency and we caution against dismissing out of hand the need for it. Furthermore, staffing cuts require that analysts review both data and metadata. Even if the metadata do not require foreign language competency, the underlying data do require it. In addition, essential technical meaning is lost in the translation between linguist and technical analyst; technical analysts often need that original source and its context. This can be gained only from proficiency in the original language. Ultimately, foreign language proficiency enables the analyst to engage in a holistic, comprehensive analytic process.

We see a connection between the depth at which the analyst must work a target and the degree of required foreign language proficiency. If analysts work a great many targets at a superficial level, they need only have a casual acquaintance with their language(s). Similarly, when analysts are assigned to an *ad hoc* crisis cell working a specific target for a finite period, they may also need only superficial language skills. In this latter case, if the crisis is of sufficient importance, dedicated language assets will be assigned to compensate for their ignorance. However, should the crisis become long-term, it is reasonable to expect them to acquire more than a passing skill in the target's language(s).

Research

Research skills provide discipline and consistency for the creation of value-added intelligence. By providing methodologies for defining the requirement to be answered, as well as methodologies for answering that query, research skills ensure analytic consistency and enable thorough exploration of the issues. Necessary research skills include methods of problem definition that ensure that, in collaboration with the consumer, analysts correctly define or redefine the problem in terms of a "research question," so as to understand the consumer's and the analyst's own objectives.[67] Research strategies, when based on the issue to be answered, help identify required sources of information, the means of information collection, and the means of analyzing and synthesizing the data.

[66] FBIS Editor's comments on the English translation of Huo, Zhongwen and Wang, Zongxiao, Guofang Keji Qingbaoyuan ji Houqu Jishu (Sources and Techniques of Obtaining National Defense Science and Technology Intelligence) (Beijing: Kexue Jishu Wenxuan Publishing Co., 1991).

[67] Russell G. Swenson and others, "Research Design," in *Research: Design and Methods* (Washington DC: Joint Military Intelligence College, 2001), 19-20. This publication is an essential guide for Community analysts developing research and analytic strategies for long-term projects.

Information Gathering and Manipulation

Information is the grist for intelligence analysis, and to be successful, analysts must aggressively seek it out. Different information/data manipulation skills are required for the various stages of the intelligence process.

- **Collection:** This stage involves gathering information from all sources. The intelligence analyst directs the collection process, causing specific resources to be tasked. Related information manipulation skills include selecting and filtering in order to assess whether the information and its sources are of value.
- **Monitoring:.** Reliability of sources and the validity of the information are always in question. Monitoring skills focus on information review, and often may involve analysis of descriptors and summaries of that data.
- **Organizing:** Skillful arrangement, formatting, and maintenance of data for analysis and technical report generation ensure access to materials in a usable format.
- **Analysis/Synthesis:** Information manipulation skills can point to patterns, relationships, anomalies and trends.
- **Interpretation:** This is the stage in the process where information is transformed into intelligence by cognitive manipulation, that is, assigning meaning to analyzed and synthesized information using critical thinking. Computers aid in this step, however, a study of 12 major "analytic" software tools concludes "true analysis will remain a people function, assisted by computer technology."[68]
- **Dissemination:** Dissemination, except for some graphic products, is now of course mostly electronic. Information preparation and presentation skills allow its transformation and publication, so that the results of analysis appear in usable formats, which may be further tailored by users.
- **Coordination:** Coordination requires analysts as well as their managers to employ "collegial" skills in the bureaucratic environment; these skills are also needed to avoid diluting the intelligence message down to the "lowest common level of agreement."
- **Evaluation:** Internal and intra-community evaluation allows the intelligence to be discussed and placed in larger contexts than that viewed by a single agency. Such collaboration may also identify the additional intelligence required to clarify issues. Evaluation can become a continuous part of the production process.[69]

Project/Process Management

Few analysts enjoy the luxury of working full time on only one problem or on one aspect of a particular problem. We distinguish between projects and processes. The former tend to have finite scope and goals whereas the latter are open-ended. Both require planning, imple-

---

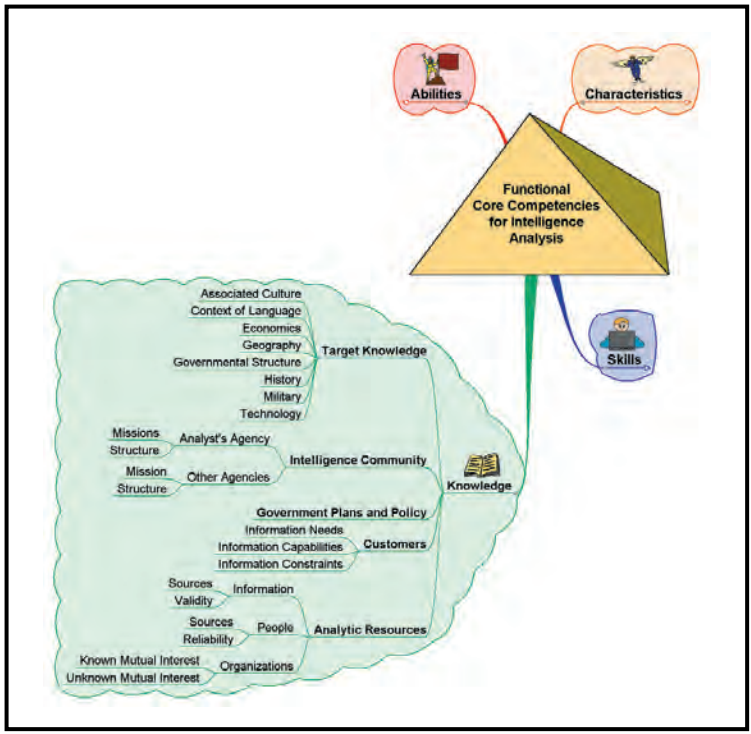
[69] See also Brei.

mentation, monitoring, and negotiating skills.[70] A project/process plan defines and clarifies what needs to be accomplished; identifies necessary resources; creates a timeline, including milestones; and makes the analyst accountable for successful completion.

KNOWLEDGE REQUIRED FOR INTELLIGENCE ANALYSIS

> Without a solid knowledge base concerning the region or issue to which the analyst is assigned, . . . the individual will not even know what questions to ask. That is, the person will not really be qualified to be called an "analyst."
>
> — *Ronald D. Garst and Max L. Gross*[71]

Knowledge consists of familiarities, awareness, or understanding gained through experience or study; it includes both empirical material and that derived by inference or interpretation.[72] Depending on the specific target, the knowledge required can vary widely. Our essential subset is shown in the figure and discussed below.



Knowledge required for successful intelligence analysis.

[70] Clifford C. Kalb, "Core Competencies: A Practitioner's View," document 207612, Merck & Co., Inc, n.d.

[71] Garst and Gross, 50.

Target Knowledge

Doing intelligence analysis in the information age is often like "being driven by someone with tunnel vision."[73] In the quest to answer a consumer's questions, the analyst often pushes aside "all the fuzzy stuff that lies around the edge—context, background, history, common knowledge, social resources."[74] Yet, to do so is perilous, for these provide balance and perspective. They offer breadth of vision and ultimately allow analysts to make sense of the information under study. By providing the context into which analysts place their work, fields of study such as anthropology, comparative religion, economics, geography, history, international relations, psychology, and sociology all interact to contribute vital knowledge about the target, which both analysts and consumers need to understand. Changes in the culture, religion, geography, or economic systems (among others) of a target may themselves be subjects of an intelligence requirement.

Gregory Treverton asserts that intelligence "is supposed to have the people who understand Bonn and Delhi better than they do Washington."[75] Without such understanding, intelligence and policy failures can occur. Treverton blames the failure of the U.S. Intelligence Community to predict India's 1998 nuclear test partially on a lack of understanding by U.S. analysts of "true" Indian motivations. He asserts that a questioning of premises coupled with greater knowledge of the reasons why India would want to conduct a nuclear test should have led U.S. analysts to different conclusions.[76]

The following selection of topics exemplifies some non-traditional but essential target knowledge areas required for thorough intelligence analysis.

- **Culture:** Culture can be defined as a group's values, standards, and beliefs. In turn, culture defines that group. The study of culture reveals the roles of individuals in the community, and how they relate to non-members of the culture. This provides insights into behaviors that are of value in predicting future behavior. This is true when the target is a people or a nation as well as when the target is a specific subgroup or individual member within a culture. Adda Bozeman points out that because political systems are grounded in cultures, "present day international relations are therefore by definition also intercultural relations ... [A]nalysts and policymakers in the West would be more successful in their respective callings if they would examine the cultural infrastructures of the nations and political systems they are dealing with."[77]
- **Message of Language:** The message of language is a part of culture, and while isolating it makes an artificial distinction, we do so to reiterate its importance for intelli-

gence analysis. What languages are utilized, by whom, and in what context, is essential in understanding the target's culture. For example, much is revealed if members of an insurgent group primarily communicate using the language of the elite members of their culture. Additionally, what the language indicates about class and personal relationships may provide clues to behaviors.

- **Technology:** Technology itself can be the subject of study by the intelligence analyst. Someone developing a target may analyze specific technologies and their infrastructure as they pertain to that target. Further, the role of technology within a region, nation, or people is an indicator of behavior. The domains of communications, utilities, transportation, manufacturing, and others, as well as the attitudes of the people to them, are rich sources of study. Technology also can provide insights into sources of information that will be available to the intelligence analyst.

Professional Knowledge

In addition to understanding their targets, intelligence analysts need to know a great deal about the context and nature of the intelligence profession, and the resources available to help them do their job well. Understanding the plans and policies of their own government enables analysts to frame their work in terms of the nation's strategic and tactical objectives. Intelligence consumers are government officials. Their needs drive analytical process and priorities. Analysts base collection tasking on the imperative to match information sources to consumer needs. These information sources, such as human-source reporting, signals intercepts and documentary research, provide the analyst with raw materials for the creation of intelligence through analysis, synthesis and interpretation.

Determining what information must be analyzed is a precursor to the analytic process. Berkowitz and Goodman identify "four different types of 'information' [used by intelligence analysts] in preparing reports and estimates: known facts, secrets, disinformation, and mysteries."[78] Known facts and secrets must be placed in context or "revealed," disinformation must be discounted, and consumers must be informed that mysteries cannot be answered. For this to occur, the types of information available and their validity, as well as the sources of that information and their reliability, must be determined.

In addition, analysts need to know what specific sources of information relevant to a particular inquiry are available for exploitation. Knowing which expert sources and subject matter experts can guide the analytic process, or can offer different or additional perspectives, enhances intelligence work. The reliability of these sources is also critical. When different sources provide contradictory information, the reliability of one source versus another may provide insights into which information is accurate; the sources may be open or secret, technical or human.

Finally, others, known and unknown, may be examining similar information for the same or different consumers. Awareness that sources of information, possibly vital infor-

[78] Berkowitz and Goodman, 86.

mation, exist, even though they remain undiscovered or untapped, keeps the analyst constantly seeking out new connections.

IMPLICATIONS FOR THE INTELLIGENCE ANALYSIS WORKFORCE

Returning to our thesis, what makes an intelligence analyst successful? Given that the analyst's purpose is to create intelligence, success means following an effective process (rigorous analysis, sound management) and creating a quality product (that conveys intelligence and meets the consumer's needs). To do this requires appropriate abilities, knowledge and personal characteristics for rigorous intelligence analysis and production. Well-honed capabilities to communicate, cooperate and think, coupled with the skills that ensure technical competency, provide the means for intelligence work. Informed, deep knowledge of the issues and their background provides both content and context for analysis. Analysts who are motivated to succeed, to know targets, and to share that knowledge ensure that consumers receive intelligence of the highest caliber.

But do intelligence analysts today approach this ideal? And can we find or grow such talent to serve the Community's mission well into the 21st century?

> Of all the personnel problems the intelligence community will face in the coming years, the most difficult to solve is likely to be maintaining the base of talent the community requires to carry out its mission.... [Much] of the work of the intelligence community is highly specialized and requires exceptional creativity.... It is also safe to say that some of the most pressing analytic skills the community will require are precisely those we cannot even foresee at this time.
>
> *— Bruce D. Berkowitz and Allan E. Goodman*[79]

Berkowitz and Goodman's judgment from 1989 remains true in 2002. The Intelligence Community remains significantly challenged to maintain and enhance an analytic talent base against numerous rapidly changing threats to national security. Further, a possible uptick in hiring and rising rates of eligibility for retirement mean that, at the least, the savvy of the analytic population will continue to dwindle at the lower end and retire from the upper end.[80] Even an adequately sized analytic workforce, lacking adequate mentoring and training from senior, expert analysts, will leave the Intelligence Community unable to meet security challenges. For example, while NSA's technological capability remains widely recognized, former director General Kenneth A. Minihan noted, "If we

don't win the talent war, it doesn't matter if we invest in the infrastructure."[81] According to the Council on Foreign Relations' independent report on the future of intelligence, "less than a tenth of what the United States spends on intelligence is devoted to analysis; it is the least expensive dimension of intelligence....This country could surely afford to spend more in those areas of analysis where being wrong can have major adverse consequences."[82] Winning the talent war requires smart investment in the hiring, training, and deployment of analysts.

With simultaneous greening and greying of the analytic workforce, analysts as a group may lack many of the core competencies necessary for successful intelligence analysis. A strategic requirement exists to resolve this problem. However, the authors know of no stratagem under consideration other than their own focus on identifying core competencies for management attention. It may be feasible to conduct small-scale, *ad hoc* or more systematic experimentation with specific analytic techniques such as that pioneered by Folker, to determine which techniques may hold the most promise for improved rigor of analysis.[83] We suspect that some experienced analysts do already match the ideal described above, although others are still operating within the outdated Cold War paradigm. Further, many novice analysts also have the willingness and potential to develop toward the ideal. But they need tradecraft mentors and teachers. Presently, there are not enough expert analysts to do both the teaching and the performance of sophisticated intelligence production.

Therefore, the Intelligence Community needs ways to enable intelligence analysts now on the job to enhance their professional skills. One approach to this problem is to provide widespread, specialized training in analytic methods. In order, however, to ensure that subsequently produced intelligence is accurate and useful, such training must focus on rigorous analytic processes that minimize biases introduced by the analyst, the consumer, the sources of the information, or the information itself. Collaborative training efforts such as those proposed in the *Strategic Investment Plan for Intelligence Community Analysis* offer another way by which intelligence analysts can acquire the skills necessary to bring greater rigor to their analyses.[84]

One analytic method in particular, known as "Analysis of Competing Hypotheses," as presented by Central Intelligence Agency (CIA) analyst Richards J. Heuer, Jr., provides a readily applicable approach to rigorous intelligence analysis. In Heuer's methodology, as used at the CIA, the analyst begins with a full set of alternative possibilities rather than the apparent single most likely alternative. Then the analyst compares each piece of evidence against each hypothesis, and determines if that evidence supports or refutes it. Evi-

[81] Quoted in Robert K. Ackerman, "Security Agency Transitions from Backer to Participant," Signal 54, no. 2 (October 1999): 23.

[82] Council on Foreign Relations, 1996, 11-12.

[83] Folker, *Intelligence Analysis in Theater Joint Intelligence Centers: An Experiment in Applying Structured Methods*.

[84] Director of Central Intelligence National Security Advisory Panel, 29ff.

dence that has no diagnostic value is taken out of consideration. After noting the evidence chain attached to each hypothesis, the analyst selects as the most probable hypothesis the one with the least amount of evidence against it. This contrasts with conventional analysis, which generally entails looking for evidence to confirm a favored hypothesis. Following the scientific method, Analysis of Competing Hypotheses seeks to eliminate hypotheses, whereas conventional analysis seeks to prove them.[85] The end result of the former is an actionable intelligence product that adds value to the consumer's development and execution of policy or strategy.

Folker's recent experiments in Theater Joint Intelligence Centers provide enticing evidence that such rigorous methods do foster analytic excellence. In four experiments, Folker provided analysts with one hour of training in Analysis of Competing Hypotheses, and then presented them with two realistic scenarios requiring analytic judgments and conclusions. A significantly greater number of the newly trained analysts derived the correct answers to the scenarios than analysts in a control group that used their own *ad hoc* methods. These findings demonstrate that while "exploiting a structured methodology cannot guarantee a correct answer, using a structured methodology ensures that analysis is performed and not overlooked." [86]

Folker therefore recommends widespread teaching of these methodologies during "both initial and subsequent training."[87] However, training is of little value unless it can be immediately applied. Thus organizational structures, culture, and processes must be aligned to permit and to reward rigorous analysis. Unless analysts are recognized and appreciated for performing sophisticated analysis, they will not embrace change. Significant recognition for high-level analysis will inspire others to follow, creating a culture that fosters and sustains excellence in tailored intelligence production.

Even if the entire analytic workforce were to adopt rigorous analytic techniques, the Intelligence Community may still lack sufficient resources to meet consumer needs. It will still need to hire new analysts, either from outside the agency or from within. However, these new employees must be highly qualified. The government cannot afford remedial training for prospective new employees lacking the necessary abilities and skills for intelligence analysis. Similarly, employees transferring into the analytic disciplines from other fields must have the prerequisite abilities and skills for analysis before joining this discipline. The field of intelligence analysis cannot safely be a catchall for employees transferring from downsized career fields.

---

[85] For a discussion of the Analysis of Competing Hypotheses see Chapter 8 of Richards J. Heuer, Jr., *The Psychology of Intelligence Analysis* (Washington, DC: Center for the Study of Intelligence, 1999).

[87] Folker, 33.

Some prospective new hires do come to the discipline with an academic background in intelligence, and many current employees pursue continuing studies related to intelligence. However, intelligence studies at the university level tend to focus on intelligence and policy, not on tradecraft. Further, it is questionable whether the fledgling field of intelligence studies by itself yet offers the wherewithal to support a claim of expertise by someone educated in that specialty, except in the narrow, self-assessed areas of intelligence process or organization. Only one non-governmental institution in the U.S. offers an undergraduate degree in intelligence research and analysis: Mercyhurst College in Pennsylvania; there, too, advanced studies are offered in conjunction with a law-enforcement related degree. Within several years, the University of New Mexico expects to offer undergraduate through doctoral degrees in intelligence; the stated goals of this program are to focus on the tradecraft of strategic intelligence.[88] Other institutions, such as Wright State University in Ohio, are beginning intelligence analysis programs. But these academic programs are too small and too limited to meet the needs of government intelligence agencies for qualified analysts.

Furthermore, general academic preparation is not enough. Training new and current intelligence analysts in professional tradecraft is a Community responsibility and obligation. Analysts need both specific job-related training and enculturation appropriate to their agencies' missions. With the investment of adequate resources, including the development of modern curricula in intelligence tradecraft, Community training programs can meet these specialized analytic training needs. This investment also can include partnering with academic institutions offering "distance learning" programs and other means of outsourcing instructional resources.

The Aspin-Brown Commission on the Roles and Capabilities of the United States Intelligence Community identified several additional actions to improve the quality of analysis. These include a minimal prerequisite to visit target countries as part of analytic orientation, rewards for acquiring and maintaining foreign language proficiency, encouragement to remain within substantive areas of expertise, and periodic rotational assignments to consumer agencies.[89] Enacted as part of employee training and orientation, these measures can substantially enhance analysts' target knowledge and skills.

In combination with the right knowledge, skills, abilities, characteristics, and methodologies, the organizational and structural changes under consideration offer a possibility to genuinely transform the analytic work force. Specific changes in analytic culture, processes, and techniques offer the Intelligence Community a unique opportunity to rebuild analysis to effectively cope with a changed world. The recognition that technol-

ogy supports, and is not a replacement for, the mental processes of analysis, highlights this opportunity.

However, it remains to be seen whether the agencies and their personnel are willing and able to carry out this essential work. Organizational changes now underway may not go far enough. Agency structures remain large and centrally planned. More agile responses to intelligence challenges, as yet undefined, may be required to counter them.[90]

A Community strategy focusing both on what consumers require, and how a professional analytic workforce can be developed is a logical follow-on to the transformations the Intelligence Community already has begun. The results of implementing such a strategy will be profound, if the transformations remain grounded in mission and are sustained through changes in leadership. In this climate, talented and motivated analysts who are highly knowledgeable about their consumers and their targets will apply rigorous analytic techniques to create actionable intelligence for decisionmakers. Under expert management, analysts will apply critical thinking skills in evaluating their own work, ensuring that it is of the highest caliber. As these analysts collaborate extensively across the Intelligence Community, the example they set will inspire others to excellence. Making this vision a reality requires action. The ideas developed here can be used as a guide to action and an instrument of change.

ABOUT THE AUTHOR

LT Michael Bennett enlisted in the Coast Guard in 1991. From 1991 to 1994 he was stationed at Marine Safety Office, Houston, Texas where he responded to oil and chemical spills and served as a member of a U.S. Customs Assist Team and Boarding Team Member enforcing federal laws and regulations in the Port of Houston/Upper Galveston Bay area. From 1994 to 1998, he was stationed at Marine Safety Office St. Louis, Missouri where he worked in the Port Operations Department responding to oil and chemical spills, enforcing federal environmental regulations and acting as the Safety and Occupational Health Coordinator for the Marine Safety Office and its two detachments located in Davenport, Iowa and St. Paul, Minnesota. In 1998, he received a Direct Commission as a Lieutenant Junior Grade and was assigned to the Office of Response at Coast Guard Headquarters where he assisted with the national and international coordination of the Coast Guard's Pollution Response Program and acted as the Coast Guard representative on the U.S. National Response Team, Response Sub-Committee. Prior to attending the Joint Military Intelligence College in 2002, LT Bennett was stationed at Marine Safety Office/Group Portland, Oregon where he was Assistant Chief of Contingency Preparedness and Planning, responsible for coordinating regional efforts relating to National Security, Port Security, Environmental Response, Anti-Terrorism and Force Protection, and response to Natural Disasters for the Pacific Northwest

THE U.S. COAST GUARD JOINS THE INTELLIGENCE COMMUNITY

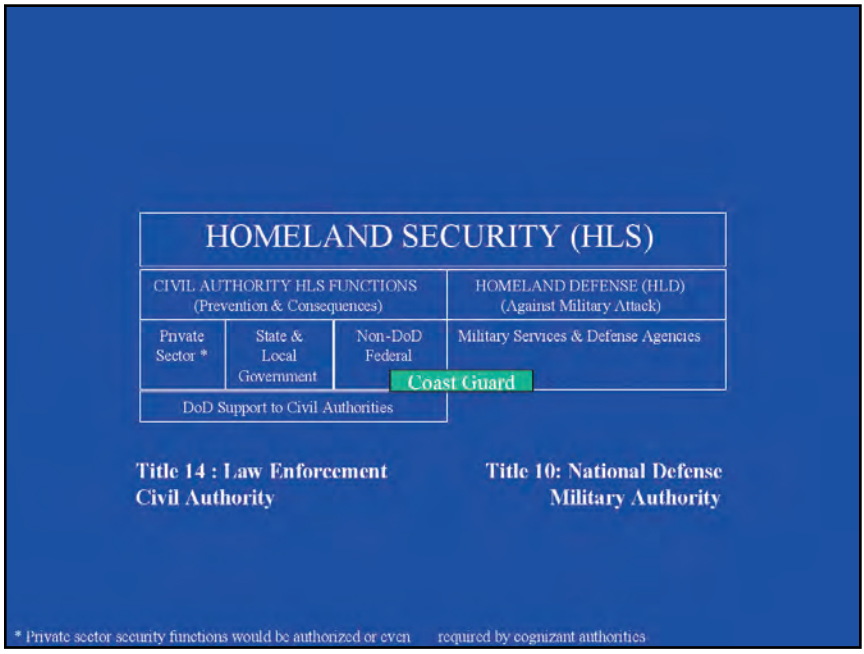
Michael E. Bennett, LT, USCG

The United States Coast Guard (USCG), like many other agencies, has experienced significant transformation since 11 September 2001. For example, the evolution of the intelligence function in the USCG was dramatically hastened, resulting in its gaining full membership in the Intelligence Community by year's end. The multiple responsibilities of this service are focused on National Defense, Environmental Protection, and Maritime Safety, Security, and Mobility in protecting the expansive U.S. Maritime Transportation System (MTS), which extends over 95,000 miles of coastline, 360 seaports, and 3.4 million square miles of Exclusive Economic Zone (EEZ)[1]

Source: Vice Admiral Allen, USCG, 7 October 2002.

[1] The EEZ consists of those areas adjoining the territorial sea of the U.S., the Commonwealth of Puerto Rico, the Commonwealth of the Northern Mariana Islands, and U.S. overseas territories and possessions. The EEZ extends up to 200 nautical miles from the U.S. coastline. The U.S. has sovereign rights over all living and non-living resources in the EEZ. Other nations may exercise freedom of vessel navigation and overflight within the EEZ. See *http://www.uscg.mil/hq/g-cp/comrel/factfile/Factcards/ Homeland.htm* for a description of the USCG Maritime Homeland Security Strategy.

Historically Coast Guard Intelligence has focused on the collection of information in support of law enforcement operations related to counter-drug and migrant interdiction. With the migration to the Department of Homeland Security (DHS) and membership in the IC, a less sharp line now exists between National Foreign Intelligence and Law Enforcement Intelligence collection because of the need for both to anticipate and prosecute illegal international migration, piracy, and other transnational threats. The USCG is the only organization simultaneously responsible for law enforcement, intelligence, and military activities. Title 14 of the U.S. Code provides the Coast Guard with its Law Enforcement and Civil authorities, and Title 10 provides this service with National Defense and Military authorities. The figure below depicts the law enforcement/military continuum for these authorities and demonstrates the placement of USCG intelligence as a bridge between the realms of law enforcement and national foreign intelligence.



Coast Guard Civil/Military Authorities Source: Vice Admiral Allen, USCG, 7 October 2002.

THE COAST GUARD ROLE IN INTELLIGENCE

The roots of the Coast Guard intelligence function trace back to the Rum War during the period of prohibition. From 1920 to 1933, the USCG provided operational

intelligence for law enforcement efforts.[2] After that era, although the Coast Guard continue intelligence support to its many law enforcement missions, not until 1984 did it establish the Intelligence Coordination Center (ICC), an information fusion activity that provides maritime intelligence support to the National Foreign Intelligence Community and Coast Guard commands at the strategic, operational and tactical level. In December 2001, through an amendment to the *National Security Act of 1947*, the USCG officially became a member of the Intelligence Community.[3] This development significantly expands the service's intelligence roles and responsibilities with respect to other members.

In a Congressional Research Service Report for Congress, a CIA official is cited as the source for the following observation comparing law enforcement and national security intelligence:

> Today there is no clear primacy for either the law enforcement or intelligence communities in the realms of international terrorism, narcotics, proliferation (as well as some areas of counterintelligence). Still, the law enforcement and intelligence communities remain designed to operate in fundamentally dissimilar manners, retaining different legal authorities, internal modes of organization and governing paradigms.[4]

As an organization straddling the boundaries between the law enforcement and intelligence communities, the USCG allows for collection of information domestically and abroad leading to detection, preemption and deterrence of threats, and when necessary, operations involving crisis and consequence management, and arrest and prosecution in the maritime environment.

ON BECOMING A COMMUNITY MEMBER

Community membership is a win-win for the Coast Guard and the Intelligence Community (IC). The IC gets a multi-mission agency with numerous regional, national, and international relationships, combined with extensive law enforcement and military authorities. The Coast Guard receives recognition for their existing efforts in support of national collection requirements, a clearly defined mission from the Director of Central Intelligence (DCI), and increased resources to support these new mission requirements.

But IC membership also involves congressional oversight, training and education, and the development of an infrastructure ready to accept these new duties. How is the Coast Guard handling this new responsibility?

An N2 for the Coast Guard

In October of 2002, the position of Assistant Commandant for Intelligence (G-C2) was created, elevating the office to a Directorate level within the Coast Guard organization. This position is held by Senior Executive Service Officer Mrs. Frances Fragos Townsend. Her position provides direct access to the Commandant of the Coast Guard, essentially filling both the N2 (Director of Intelligence) and Naval Security Group (NSG) roles for the Coast Guard. Additionally, Mrs. Townsend and the Commandant of the Coast Guard share the responsibility as the service's Senior Official of the Intelligence Community (SOIC), ensuring compliance with all community tasking and related oversight.

Mrs. Townsend, who came from the Justice Department's Office of Intelligence Policy Review, is responsible for a burgeoning Intelligence Directorate that could soon number more than 150 people at the headquarters level alone. This moves the Intelligence Directorate out of its longtime position under Coast Guard Operations, significantly expanding its responsibilities and expectations, one of them being the development of a career path to support the new mission.

Establishing a New Career Path

Prior to community membership, being a Coast Guard Intelligence Officer could have been detrimental to one's career. It was not that the job lacked excitement or qualified people; a recognized career path simply did not exist. An intelligence officer usually came from the operational (law enforcement) or marine safety (waterways management/environmental response) community, did one tour as an intelligence officer, and then went back to their specialty in order to improve chances for promotion. With the creation of G-C2, a formal career path now exists for enlisted and officers alike, supported by a rapidly developing training and education program.

A Direct Commission Program for Intelligence Officers seeks qualified enlisted or officer candidates from other services who are interested in a career with the Coast Guard, and who meet the prerequisites for commissioning (a Baccalaureate degree, combined with intelligence or law enforcement-related experience). Opportunities also exist for Officers to engage in post-graduate education at the Joint Military Intelligence College, where they can pursue an accredited Master of Science of Strategic Intelligence degree.

Bridging the Gap between Law Enforcement Information and National Foreign Intelligence Collection

Recent Coast Guard initiatives combined with current Coast Guard legal authorities have laid a foundation for the collection, fusion, and analysis of information in support of the IC and Department of Homeland Security. With IC membership comes an increase in responsibilities. The DCI will task the Coast Guard based on the new mission recently approved. Additionally, the USCG will continue to support other national collection requirements, but this will be done through its own Intelligence Coordination Center (ICC) and the development of newly created Maritime Intelligence Fusion Centers (MIFC) and Field Information Support Teams (FIST). The MIFC's are strategic fusion centers on the east and west coast that will collect, analyze and fuse information in support of national objectives, and the FIST will collect law enforcement intelligence at strategic economic and military ports throughout the country.

The USCG is also expanding its visibility in the Community through participation in numerous multi-agency operations. Although they have always participated in national and regional Joint Terrorism Task Force operations, recent initiatives also include additional participation with the Defense Intelligence Agency's Joint Intelligence Task Force-Combating Terrorism (JITF-CT), the U.S. Northern Command, and the Central Intelligence Agency's Crime and Narcotics Center (CNC) and Crime and Terrorism Center (CTC).

Dealing with Congressional Oversight

With Community membership comes Congressional oversight, and for the Coast Guard this means clearly defining the separation between law enforcement and Intelligence Community duties by establishing policies and procedures for collection and management of information within the service. In order to provide the necessary separation between these elements and yet maintain the continuity needed for detection, pre-emption and deterrence of threats, the Coast Guard has worked closely with the Community Management Staff and other intelligence organizations to capture best practices and lessons learned in order to avoid the information-sharing pitfalls experienced by other agencies. These lessons learned were then incorporated into the *Coast Guard Intelligence Capstone Document*[5] that delineates the role of the Coast Guard Intelligence Organization. The *Capstone Document* describes the Coast Guard Intelligence Program as a "binary organization consisting of two closely linked parts: the *National Intelligence Element* and the *Law Enforcement Intelligence Program*."

---

[5] United States Coast Guard, *Coast Guard Capstone Document*, *COMDTINST 3820.10*, 26 February 2003 (Washington D.C.). Cited hereafter as Capstone Document.

The *National Intelligence Element* conducts "intelligence activities," as described in Executive Order 12333 and the National Security Act of 1947, including the collection, retention, and dissemination, of *national intelligence (foreign intelligence and counter-intelligence*) under those authorities. The National Intelligence Element is part of the Intelligence Community and is governed by procedures approved by the Attorney General. The National Intelligence Element consists of only those personnel or components designated by the Assistant Commandant for Intelligence, with the approval of the Chief of Staff.

The *Law Enforcement Intelligence Program* describes the collection, retention, and dissemination of information pursuant to Coast Guard law enforcement and regulatory authority. Persons and components that collect, process and report law enforcement intelligence and other information, including those persons performing intelligence functions as a collateral duty, are conducting functions under the Law Enforcement Intelligence Program. These persons and components are not part of the National Intelligence Element.[6]

Additionally, under provisions of the USA PATRIOT ACT and *Homeland Security Act of 2002* (HLS), the Coast Guard (in addition to other agencies) is required to provide critical information or intelligence, "gathered in the course of operations to enforce criminal laws," to the DCI. Warning information on foreign or terrorist threats is also reported to the Undersecretary for Information Analysis and Infrastructure Protection in the Department of Homeland Security as required under the Homeland Security Act of 2002. Foreign Intelligence is defined in the *National Security Act of 1947* as "information related to the capabilities, intentions, or activities of foreign governments, foreign organizations, foreign persons, or international terrorist activities" related to threats against the United States."[7] These provisions are designed to eliminate obstacles for sharing law enforcement information with the DCI while enhancing the ability of DHS to "connect the dots between diffuse bits of information"[8] in order to detect and preempt terrorist activities. Prior to 11 September 2001 there was no one agency responsible for coordinating this task throughout the federal government. In the Coast Guard this responsibility for reporting rests with G-C2. By centralizing the reporting of this information within one directorate, the Coast Guard will be able to reduce circular and duplicate reporting and simultaneously measure the effectiveness of Coast Guard information sharing practices.[9]

---

[6] Capstone Document, Enclosure 1.

[7] United States Coast Guard, "Implementation of Mandatory Information Sharing Provisions Under the USA PATRIOT ACT and Homeland Security Act of 2002," *Memorandum*, (Washington D.C.): 23 January 2003. Cited hereafter as USCG Memorandum.

[8] Richard A. Best, "Homeland Security: Intelligence Support," *CRS Report for Congress* RS21283 (Washington, DC: Congressional Research Service, Library of Congress, 4 March 2003).

[9] USCG Memorandum.

By circumscribing the relationships between the *National Intelligence Element* and *Law Enforcement Intelligence Program*, as approved by the Attorney General, the Coast Guard remains the only federal agency that is simultaneously a law enforcement, military, and intelligence service. Having this capability within the newly created Department of Homeland Security, Secretary Ridge now has a powerful tool: the ability to collect, analyze, and fuse law enforcement intelligence with national foreign intelligence that can lead to the critical pre-emption of transnational or asymmetric threats to homeland security or to interests abroad. As noted by one senior Coast Guard Intelligence official: "The different designations of *Law Enforcement Intelligence* and *National Intelligence* defines how information is collected and not how it is used."[10]

Avoiding the Pitfalls

A CRS report for Congress has noted that several pitfalls appear "systemic" in the Intelligence Community: "lack of preparedness to deal with challenges of global terrorism, inefficiencies in budgetary planning, the lack of adequate numbers of linguists, a lack of human sources, and an unwillingness to share information among agencies."[11] Although new to the IC, the Coast Guard is not unversed in some or even all of these problems. One aspect where the Coast Guard has considerable experience is in sharing information with other agencies. As a small agency with limited resources and far-reaching responsibilities, the Coast Guard has developed extensive partnerships at the federal, state, and local level in order to accomplish its mission. Most, if not all Coast Guard operations involve multi-agency and interagency cooperation. However, one aspect needing further attention by the service is its lack of a formal language-training program. While the Coast Guard does have linguists, very few have attended a formal language school, and even fewer have the requisite skills necessary to meet the standards required of its Defense Department counterparts.

An October 1996 article presaged the difficulties facing a new intelligence organization. It notes that "launching and maintaining an intelligence system is a complex task. The hardest part is achieving the right level of balance among the key system elements, especially among published information, human collection, and analysis."[12] In other agencies, the organizational culture and information-sharing practices have often limited the flow and accuracy of information between the analyst and the decisionmaker. As Lowenthal observes, "a dialogue between producers and consumers should take place after the intelligence has been received. Policymakers should give the intelligence community some sense of how well their requirements are

being met and discuss any adjustments needed" [13] Clearly defined requirements combined with doctrine, process, and training and education are the key, systematic elements that can provide the necessary balance the Coast Guard needs as a successful member of the IC.

As Amy Zegart concludes, "to do their jobs, national security officials must concern themselves with other agencies...their activities inherently overlap and intersect."[14] A noteworthy benefit of Coast Guard membership in the IC is that the service has no culture of "owning" information. On the contrary, the service has a reputation for sharing information (while maintaining the necessary safety protections) leading to relationship-building that can provide enhanced detection, pre-emption, and deterrence, while bringing together civilian, law enforcement, intelligence, and military agencies to combat threats to the homeland. These combined responsibilities to collect, analyze, and fuse law enforcement and national foreign intelligence information rest with an agency that has historically had a reputation for public trust and confidence.

The National Defense Intelligence College supports and encourages research on intelligence issues that distills lessons and improves Intelligence Community capabilities for policy-level and operational consumers

Critical Thinking and Intelligence Analysis, Second Printing (with revisions)
David T. Moore

This series of Occasional Papers presents the work of faculty, students and others whose research on intelligence issues is supported or otherwise encouraged by the National Defense Intelligence College (NDIC) through its Center for Strategic Intelligence Research. Occasional Papers are distributed to Department of Defense schools and to the Intelligence Community, and unclassified papers are available to the public through the National Technical Information Service (www.ntis.gov). Selected papers are also available through the U.S. Government Printing Office (www.gpo.gov).

This work builds on earlier publications in this series, particularly Occasional Papers Two, Six, and Seven; *Getting Intelligence Right: The Power of Logical Procedure*, *Intelligence Essentials for Everyone*, and *Intelligence Analysis in Theater Joint Intelligence Centers: An Experiment in Applying Structured Methods*. The author's insights have been developed through years of creative interaction with the Community's leaders in analytic methododology, and tested for practicality by successive waves of students in training and education courses throughout the Community.

Proposed manuscripts for these papers are submitted for consideration to the NDIC Press Editorial Board. Papers undergo review by senior officials in Defense, Intelligence and civilian academic or business communities. Manuscripts or requests for additional copies of Occasional Papers should be addressed to Defense Intelligence Agency, National Defense Intelligence College, MC-X, Bolling AFB, Washington, DC 20340-5100.

This publication has been approved for unrestricted distribution by the Office of Security Review, Department of Defense.

Preface

The world in which intelligence analysts work has changed dramatically over the 67 years since the beginning of the Second World War. Adversaries have shifted from large armies arrayed on battlefields to individuals lurking in the shadows or in plain sight. Further, plagues and pandemics, as well as floods and famines, pose threats not only to national stability but even to human existence. To paraphrase a Chinese curse, we certainly live in interesting times.

Our times demand fresh, critical reasoning on the part of those tasked to assess and warn about threats *as well as those tasked to act on those threats*. Education in the bases and practices of intelligence foraging and sensemaking – often called intelligence collection and analysis – is a means by which this can be accomplished. Indeed, the Intelligence Reform and Terrorism Prevention Act of 2004 legislates improved education for intelligence analysis. But, that education is not specifically defined. This volume provides a framework for one area of the act's educational requirement: improving how analysts think – and by extension, how policymakers act. It asserts that people who are skilled critical thinkers are better able to cope with interesting times than those who are not.

The model for thinking developed here also provides specific tools for coping with accelerating disruptive technologies. Such technologies routinely appear in the hands of adversaries. They also offer intelligence professionals capabilities to counter adversaries in novel ways. The key is knowing which technologies are truly disruptive in advance, which pose threats, and which can be harnessed to mitigate threats. Critical thinking – as it is here defined and developed – provides part of the solution as it encourages careful consideration of the available evidence, close examination of presuppositions and assumptions, review of the alternate implications of decisions, and finally, discussion of alternative solutions and possibilities. In short, it equips intelligence professionals with an essential tool for their work.

Foreword

Mark M. Lowenthal
Former Assistant Director of Central Intelligence
for Analysis and Production
President, Intelligence & Security Academy, LLC

Some years ago, when I worked at the Congressional Research Service, my colleague next door had a sign in his office: "Thinking is hard work. That's why so few people do it." Indeed. As sentient beings we think all the time. Our waking, conscious hours are full of thoughts: what to wear; what to eat; how to respond to someone. These all take thought. One might venture to say that we think almost unconsciously through most of our day.

And then there is that *other* thinking: Thinking about the conundrums that we face, the alternatives and choices we have to make on larger issues, the dilemmas we wish to resolve. This *is* hard work. And if the work you do is largely intellectual in nature, then you are thinking that much more often about these more difficult problems. This is not to suggest that those who work with their hands or in crafts or industry do not think. Of course they do. But these people, in the end, have something physical to show for their thought and its execution. Intellectuals only have their thoughts to show, presumably expressed for others in some way.

Intelligence officers are engaged in an intellectual pursuit. They are trying to solve puzzles, resolve uncertainties, discover the nature and meaning of things that others would keep secret. They must have an entire intellectual apparatus to help them identify the problem, assess the parts they know and the parts they do not, come up with an explanation of what is going on and then express it in a way that others – including an audience not steeped in their own techniques – can understand.

As one would expect, the Intelligence Community has spent a fair amount of time thinking about how it does analysis. But most of this has been spent on techniques, presentation and outcomes; much less has been spent on what happens intellectually while you are thinking. That, indeed, is what critical thinking is about: the ability to step out of one's thoughts, if you will, to examine them and the process that brought them about even while you are thinking them. It does not require some higher level of cosmic consciousness or a split personality. It does require training and thought! So now we are thinking about our thinking while we are thinking – a mental triple play, if you will. This is no mean feat and it is a very crucial skill for intelligence analysts.

John McLaughlin, a former Deputy Director of Central Intelligence, has observed that one of the major perceptions that separates intelligence officers from the policy makers is that policy makers tend to be optimists, believing they can get things done, while intelligence officers tend to be skeptics, knowing that little is known with certainty. Like everyone else, however, intelligence analysts can be adamant about their conclusions, understanding the path they took to reach them, and well-satisfied that they have done the right work and come to the right end. That is where critical thinking comes in. The ability to examine how you came to your conclusion is an important adjunct to your other intellectual work. You may be certain or you may not – which is also acceptable. But you owe it to yourself and to your readers to have examined how you got there.

This is not as easy as it sounds for intelligence analysts for the simple reason that they are usually very pressed for time. There are not a lot of lulls in the analyst's work week, which makes it very difficult to be introspective. This means that critical thinking ought to be something that is ingrained in analysts as part of their training, so that it becomes reflexive. But to do that, one must first understand critical thinking – what it is, how to do it, how to teach or learn it. That is the outstanding value of this monograph by David Moore.

The Intelligence Community is filled with people happily working away under a cloak of anonymity, satisfied in making their contribution to part of a larger activity about which very few beyond their immediate circle of co-workers will know. David Moore has long been one of these contributors. In addition to his duties as an intelligence officer at the National Security Agency, David Moore has devoted many fruitful hours to the intellectual underpinnings of intelligence, especially to what makes analysts and what makes better analysts. His work on analytic core competencies, written with his colleague Lisa Krizan, is a fascinating dissection of the intellectual attributes that make up an intelligence analyst. It was also a very influential work, becoming a prime motivator in the creation of the Analytic Resources Catalog created under Director of Central Intelligence George Tenet and now much touted by Director of National Intelligence John Negroponte.

This new monograph on critical thinking will serve a similar purpose. Much has been written in the last five years about intelligence and about the errors that it can make. Some of this has been diagnostic; much of it has been blithely condemnatory. Prescriptions about connecting dots better (an absurd metaphor), about the need to share information better and alarms about groupthink do not get us closer to improvements in the art, craft and profession of intelligence. New ways of thinking about our profession, new ways of doing our work and new ways of assessing it will be useful. Critical thinking needs to be at the top of this list of desiderata.

I would like to believe that we are on the verge of a renaissance in intelligence studies, and more specifically in the intellectual basis of intelligence analysis. There are many straws in the wind: discussions about a national intelligence university and a lessons learned center, more schools offering serious courses about intelligence and books like this. Critical thinking is and should be critical for all analysts and they will profit from this book.

Commentary:

Jeffrey R. Cooper
SAIC Technical Fellow
Science Applications International Corporation

David Moore has written an elegant and largely persuasive argument for the Intelligence Community to move forthrightly and adopt critical thinking in order to improve the quality both of its analytic processes and its intelligence judgments. Since I have recently written about the need for the Community to identify and cure deep-seated and systemic "analytic pathologies," I am obviously sympathetic to the general case for incorporating more rigorous analytic processes—among which "critical thinking" is one attractive approach.[1] Along with Moore, I also believe strongly that the traits often associated with critical thinking need to become fundamental characteristics of every analyst and to be practiced consistently in their work habits. Moore discusses these aspects at some length and highlights their value to making sounder judgments.

In doing so, he makes a compelling case that critical thinking can help analysts reshape their methods in ways that help to avoid damaging errors and enhance judgment. He and I agree with Rieber and Thomason that we should validate the potential improvement before widespread deployment.[2] The need for validation raises some related points concerning the criteria for evaluation and measurement. As Philip Tetlock has noted, on the one hand, one can do evaluation by assessing whether a process (assumed to be good) has been followed; one the other hand, one can also assess

1 Jeffrey R. Cooper, "*Curing Analytic Pathologies: Pathways to Improved Intelligence Analysis*" (Washington, DC: Central Intelligence Agency, Center for the Study of Intelligence, 2005). Cited hereafter as Cooper, *Pathologies*.

2 Steven Rieber and Neil Thomason, "Toward Improving Intelligence Analysis: Creation of a National Institute for Analytic Methods," *Studies in Intelligence* 49, no. 4 (Winter 2006), 71.

quality by looking at the products themselves.[3] However, following a good process does not guarantee good products, nor does a good judgment necessarily validate the quality of the analysis or the analyst. Both approaches have flaws as methods of validation.

I urge the leadership of the Intelligence Community to place far more emphasis on structured analytic methods. In my view, the transformation of the intelligence enterprise demands a more curious, more agile, and more deeply thoughtful cadre of intelligence analysts—but it should also require the same traits among its intelligence organizations and the intelligence enterprise as a whole. Moore notes that "Investment in critical thinking as part of the analysis process minimizes the likelihood of specific failures" (page 81). However, from my perspective, critical thinking (and other structured methods) are more important for changing the organization's overall approach to analysis, rather than in improving specific judgments or preventing particular failures.

I believe such methods are crucial in preventing systemic analytic pathologies from developing, exactly because the Community lacks many of the desirable self-corrective mechanisms found in science. Second, while Moore focuses on the role of critical thinking in improving an individual analyst's ability to make good judgments, my view emphasizes the importance of more rigorous processes for the organization as a whole if it is to improve its capacity to meet user needs. Indeed, given my emphasis on the systemic nature of the pathologies that afflict intelligence analysis, structured analytic methods become a first line of defense in preventing networks of errors—they are like "ripstops" that keep problems from propagating into wider "error-inducing systems," in Perrow's terms. The quality of "mindfulness" and a more self-reflective process are essential if the intelligence organizations are to acquire some of the desirable characteristics of high-reliability organizations. While critical thinking can clearly assist individual analysts, and these "memes" can be spread through viral dissemination, I would place far more emphasis on fomenting social and organizational changes as remedies.

---

3 Philip E. Tetlock, *Expert Political Judgment: How Good Is It? How Can We Know?* (Princeton, NJ: Princeton University Press, 2005).

Finally, exactly because Moore focuses so tightly on the value of critical thinking to improve how individual analysts reason, he largely ignores the important role such habits should, and could, play in the "social construction" of intelligence analysis *and its communication to users of that intelligence*. The use of more structured techniques "to present more effective assessments" should go beyond simply convincing policymakers "to question their own assumptions on the issues" (page 80). By restructuring both the analytic process and the modalities of interactions with policy users, critical thinking techniques can draw policy users into "co-creating" important judgments and, by doing so, get them to adopt some of the important attributes of critical thinking. This internalization would be more powerful than hoping the exquisite brilliance of the improved analytic judgments might make them more palatable.

These minor quibbles aside, David Moore has highlighted for the Intelligence Community and its users some tangible methods for improving intelligence analysis and addressing systemic analytic pathologies.

Commentary

Francis J. Hughes
Professor, National Defense Intelligence College

> The truly difficult problems of the information age are not technological; rather, they concern ourselves – what it is to think, to reason, and to engage in conversation [using] … new analytic techniques, new conceptual tools with which to analyze and understand the workings of the human mind.
>
> —Keith Devlin, *Goodbye Descartes: The End of Logic and the Search for a New Cosmology of the Mind*, 1997

David Moore has undertaken a valuable initiative on behalf of the Intelligence Community by producing this monograph on critical thinking. In doing so, he has addressed the concerns of Keith Devlin and many other scholarly writers on the subject of human reasoning. By contextualizing the concept and practices of critical thinking within intelligence analysis, he has set forth a much-needed cognitive linkage between intelligence analysis and the human thought process, which, as he states, remains otherwise "poorly understood."

Mr. Moore has developed a methods-of-thinking course, outlined in the Appendix to this paper, which should guide the collection of evidence, the reasoning from evidence to argument, and the application of objective decision-making judgment. Critical thinking in intelligence depends primarily on a conscious application of suitable habits of thought, and the course certainly promises to advance the education of intelligence professionals.

Commentary

Gregory F. Treverton
RAND Corporation
Former Assistant Director of Central Intelligence for
Analysis and Production
and Vice-Chairman, National Intelligence Council

David Moore has added his powerful voice to those calling for America's intelligence analysts to be more self-conscious about their methods and more venturesome in applying more formal methods. His starting point is critical thinking, but his strong case embraces a range of techniques from Paul and Elder's checklist, to analysis of competing hypotheses (ACH), to Factions analysis, which is really a way to be more systematic in aggregating subjective judgments, to techniques such as those developed by the Novel Intelligence from Massive Data (NIMD) project. These help analysts search for patterns and test hypotheses. Moore's discussion pays particular attention to critical thinking about *evidence* – that is perhaps natural given that the National Security Agency is his home agency, but it is also a welcome emphasis.

My own explorations of the analytic agencies over the last few years confirm my own experience managing the National Intelligence Council (NIC): In general, U.S. intelligence analysis has been neither very self-conscious about its methods, nor made much use of machines and formal analytic tools. That is Moore's point of departure, and it is a case made graphically by Rob Johnston, on whose work Moore draws. The state of affairs Moore and others describe is changing, and his work should contribute to accelerating that change, in a variety of experiments and pilot projects.

Moore's paper raises at least two intriguing questions at its edges. He rightly takes issue with Malcolm Gladwell's book about the power of unconscious thought or "deliberation without attention."

That said, clever defense lawyers often discredit ballistic experts by asking them to be explicit about how they reached their conclusions. Likewise, chess masters can be reduced to middle-weights by having to explain the logic of their moves. In both cases, the decisions result from patterns as much sensed as seen, the result of thousands of previous cases. I sometimes worried at the NIC that the more we required analysts to be explicit about their methods, the more we risked turning them into middle-weights.

Finding ways to incorporate not just expertise, but also hunch and sense into intelligence analysis is a challenge that lies ahead. The Defense Advanced Research Projects Agency's ill-fated experiment a few years ago seeking to establish a terrorism futures market was testimony to how hard the challenge will be. When the idea became public, every politician – right, left and center – quickly denounced it as borderline immoral. Over the ensuing days, however, a wide range of analysis commented on what a good idea it might have been when information is in short supply and there is a premium on sensing patterns before they become facts.

The second issue is consumers of intelligence, who figure only at the margins of Moore's discussion. We can only hope he is right that better analysis will find, and perhaps help create, a better audience. But the unboundedness of the terrorist threat we now face means that intelligence and policy no longer share a "story" comparable to that about state threats, like the Soviet Union. In principle, that would suggest that policy should accord more time and attention to intelligence, but that is not likely to happen in Washington's whirligig.

Thus, intelligence will need to be as creative in finding new ways to work and communicate with policy officials as it is in improving its analytic techniques. In the process, it will need to rethink what it regards as its *product.* I came to think at the NIC that our product was not really National Intelligence Estimates but, rather, National Intelligence *Officers* – people, not paper, and people in a position to come to know their policy counterparts and to make their expertise available informally, in meetings or at lunch.

Acknowledgments

The first notes for this paper were begun a year prior to the 11 September 2001 terrorist attacks in New York and Virginia as part of research conducted with a peer, Lisa Krizan, on a set of core competencies – knowledge, skills, abilities, and an associated set of personal characteristics – for successful intelligence analysis. At the time, the notion of critical thinking was at best vaguely understood by members of the Intelligence Community, and the National Security Agency (NSA) was no exception. Six years later critical thinking is a recognized key skill by which intelligence readiness is defined at NSA. Similar growth in its importance is recognized elsewhere in the Community. This recognition is due in part to the work of Dr. Linda Elder, Dr. Gerald Nosich and Dr. Richard Paul, all of the Foundation for Critical Thinking. They have created a practical model for critical thinking that is both effective and easy to teach.

That the Paul and Elder model is known within the Intelligence Community is due in no small part to Professor Francis J. Hughes of the National Defense Intelligence College (NDIC). It was he who introduced the author to the model and encouraged attendance at Paul and Elder's annual conference on critical thinking. He kindly also provided a commentary on the paper. Dax Norman, of the NSA Associate Directorate for Education and Training, a number of NSA colleagues, and approximately 250 participants in the NSA critical thinking and structured analysis course helped make that course a reality and additionally provided valuable insights into the nuances of critical thinking. Comments from LT Robert D. Folker, USAF, also provided insight into the teaching of critical thinking. LT Folker developed a similar course while a student at the NDIC that unfortunately did not remain in the curriculum.

As the paper progressed, a number of colleagues and peers provided feedback, comments, and challenges to the arguments presented. They include, in alphabetical order, Solveig Brownfeld, NDIC; James Bruce, SAIC; Jan Goldman, NDIC; Mary Rose Grossman, the John F. Kennedy Presidential Library and Museum; Alexandra Hamlet; Noel Hendrickson, James Madison University;

Robert Heibel, Mercyhurst College; Richards J. Heuer, Jr., Central Intelligence Agency (retired); Norval J. Hilmer, Defense Intelligence Agency; LTCOL James Holden-Rhodes, USMC (retired); Morgan D. Jones, Central Intelligence Agency (retired); Hugo Keesing, Defense Intelligence Agency (retired); Mark Marshall, NDIC; Stephen Marrin, University of Virginia; Montgomery McFate, Institute for Defense Analysis; William Reynolds, Least Squares Software; the staff of the Central Intelligence Agency's Sherman Kent Center; and the staff of the John F. Kennedy Presidential Library and Museum. Several other colleagues at the National Security Agency – who wish to remain anonymous – also offered valuable insight and suggestions.

Three colleagues, Mark Lowenthal, president of the Intelligence & Security Academy, LLC; Jeffrey Cooper, Science Applications International Corporation; and Gregory Treverton, Rand Corporation, also deserve mention. Mark kindly agreed to write the foreword and offered valuable suggestions. His quip about really good analysts set up much of the arguments presented herein. Both Jeff and Greg provided critical comments and suggestions late in the game. They also kindly agreed to write commentaries on the paper.

Russell Swenson, Director of NDIC's Center for Strategic Intelligence Research and NDIC Press editor, did what a really good editor is supposed to do: His input and recommendations ensured that the arguments that follow were focused and strong. The Center's William Spracher also provided valuable technical editing services. Colleague Lisa Krizan provided a final review of the text that proved extremely valuable. This paper would not have been published if not for their dedicated assistance to the author.

Acknowledgment is due to four other people. Peter and Mary Moore encouraged their son to be inquisitive and to always look beyond the obvious for answers. Anthropologist John McDaniel first introduced the author – then a student at Washington and Lee University – to an analogy for intelligence sensemaking: science-based field archaeology. Finally, Elizabeth Moore provided tremendous encouragement. She also graciously tolerated the many nights and weekends spent writing, listening to, and commenting on, ideas as

they occurred, sharpening the resulting arguments. It is to these people that this work is dedicated.

While the author was privileged to receive assistance of others, this remains his work and any errors are his. The author may be reached via electronic mail at dtmoore@nsa.gov.

CRITICAL THINKING AND INTELLIGENCE ANALYSIS

David T. Moore

Examples included in this paper were selected to illustrate points raised by the author. No interest by the National Security Agency, the Department of Defense, or any other agency of the U.S. Government should be inferred from their inclusion.

Abstract

Analysts and analysts alone create intelligence. Although technological marvels assist analysts by cataloguing and presenting data, information and evidence in new ways, they do not do analysis. To be most effective, analysts need an overarching, reflective framework to add structured reasoning to sound, intuitive thinking. "Critical thinking" provides such a framework and goes further, positively influencing the entire intelligence analysis process. Analysts who adopt critical thinking stand to improve their analyses. This paper defines critical thinking in the context of intelligence analysis, explains how it influences the entire intelligence process, explores how it toughens the art of intelligence analysis, suggests how it may be taught, and deduces how analysts can be persuaded to adopt this habit.

Definitions

Thinking – or reasoning – involves objectively connecting present beliefs with evidence in order to believe something else.

Critical Thinking is a deliberate meta-cognitive *(thinking about thinking)* and cognitive *(thinking)* act whereby a person reflects on the quality of the reasoning process simultaneously while reasoning to a conclusion. The thinker has two equally important goals: coming to a solution and improving the way she or he reasons.

Intelligence is a specialized form of knowledge, an activity, and an organization. As knowledge, intelligence informs leaders, uniquely aiding their judgment and decision-making. As an activity, it is the means by which data and information are collected, their relevance to an issue established, interpreted to determine likely outcomes, and disseminated to individuals and organizations who can make use of it, otherwise known as "consumers of intelligence." An intelligence organization directs and manages these activities to create such knowledge as effectively as possible.

CRITICAL THINKING AND INTELLIGENCE ANALYSIS

Introduction: How Do People Reason?

The best analytical tool remains a really good analyst.

—Mark Lowenthal, Former Assistant Director of Central Intelligence for Analysis and Production

To create intelligence requires transformations resulting from an intellectual endeavor that sorts the "significant from [the] insignificant, assessing them severally and jointly, and arriving at a conclusion by the exercise of judgment: part induction, part deduction," and part abduction.[4] That endeavor is known as *thinking*, or "that operation in which present facts suggest other facts (or truths)."[5] Thinking – or as it is sometimes known, reasoning – creates an "objective connection" between our present beliefs and "the ground, warrant, [or] evidence, for believing something else."[6]

These three reasoning processes trace the development of analytic beliefs along different paths. Whereas inductive reasoning reveals "that something is probably true," deductive reasoning demonstrates "that something is necessarily true."[7] However, both are limited:

4 William Millward, "Life in and out of Hut 3," in F. H. Hinsley and Alan Stripp, *Codebreakers: The Inside Story of Bletchley Park* (Oxford, UK: Oxford University Press, 1993), 17. The author adds "abduction" for reasons that will shortly become evident.

5 John Dewey, *How We Think: A Restatement of the Relation of Reflective Thinking to the Educative Process* (New York, NY: D.C. Heath and Company, 1910), 12. Cited hereafter as Dewey, *How We Think*.

6 Dewey, *How We Think*, 12.

7 David A. Schum, "Species of Abductive Reasoning in Fact Investigation in Law," *Cardozo Law Review* 22, nos. 5–6, July 2001, 1645, emphasis added. Cited

inductive reasoning leads to multiple, equally likely solutions and deductive reasoning is subject to deception. Therefore, a third aid to judgment, abductive reasoning, showing "that something is plausibly true," can offset the limitations of the others.[8] While analysts who employ all three guides to sound judgment stand to be the most persuasive, fallacious reasoning or mischaracterization of rules, cases, or results in any of the three can affect reasoning using the others.

Inductive reasoning, moving from the specific to the general, suggests many possible outcomes, or the range of what adversaries may do in the future. However, inductive reasoning lacks a means to distinguish among each outcome – all are possible. An analyst has no way of knowing whether a solution is correct.

Deductive reasoning on the other hand, moving from the general to the specific, addresses questions about adversarial behavior and intentions. Deductive reasoning becomes essential for warning. Based on past perceptions, certain facts indicate specific outcomes. If, for example, troops are deployed to the border, communications are increased, and leadership is in defensive bunkers, then war is imminent. However, if leadership remains in the public eye then these preparations indicate that an exercise is imminent.

Abductive reasoning reveals plausible outcomes to the intelligence analyst. When an adversary's actions defy accurate interpretation through existing paradigms, abductive reasoning generates novel means of explanation. In the case of intelligence warning, an abductive process presents policy–making intelligence consumers with an "assessment of probabilities." Although abduction provides no guarantee that the analyst has chosen the correct hypothesis, the probative force of the accompanying argument indicates that the most likely hypothesis is known and that elusive, actionable intelligence is on tap.

---

hereafter as Schum, "Species." American mathematician, logician, semiotician, and philosopher Charles Sanders Peirce (1839–1914) developed the concept of abductive reasoning. See Joseph Brent, *Charles Sanders Peirce: A Life* (Bloomington, IN: Indiana University Press, 1998).

8 Schum, "Species," 1645.

Figure 1 models analysts' thinking about HUMINT received during the summer of 1962 regarding reports of foreigners in Cuba. An initial (fallacious) conclusion derived from inductive reasoning apparently was reapplied through deductive reasoning as explained in the case study incorporated in this paper.[9] Something else was needed – but not considered – to challenge the initial conclusion that "All HUMINT from Cuba was false."

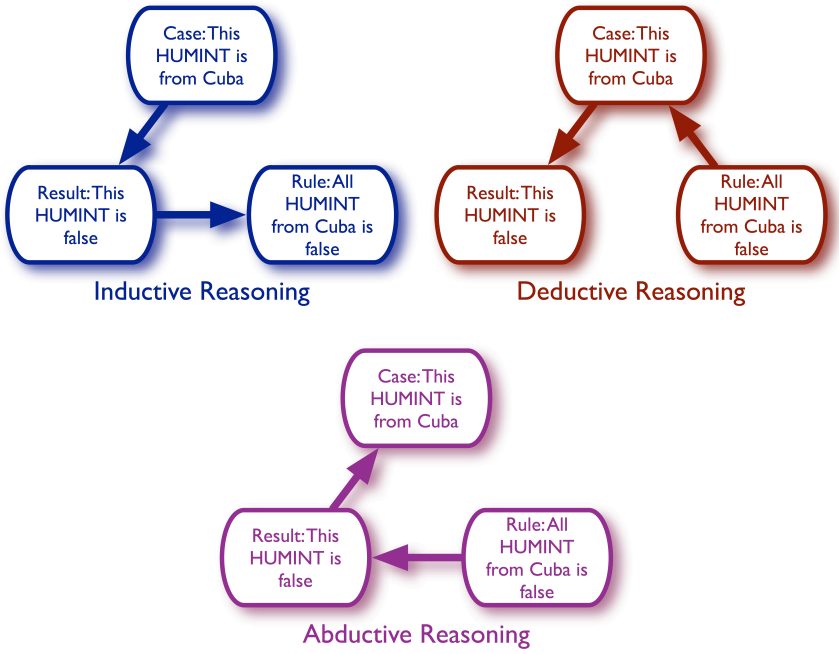

Figure 1: A Comparison of Inductive, Deductive, and Abductive Reasoning

Sources: Adapted from Thomas A. Sebeok, "One, Two, Three Spells UBERTY," in Umberto Eco and Thomas A. Sebeok, *The Sign of Three: Dupin, Holmes, Pierce* (Bloomington, IN: Indiana University Press, 1988), 8; and James H. Hansen, "Soviet Deception in the Cuban Missile Crisis," *Studies in Intelligence*, 46, no. 1 (2002), 56.

If analysts can model an adversary's intentions based on observable actions, adversaries also can deduce how those analysts will have

9 While there is no evidence it was applied in the Cuban case, abductive reasoning is included in the figure for purposes of illustration.

moved toward these conclusions. Under these circumstances, the adversary then can engage in deceptive practices that can lead an intelligence service to misinterpret that adversary's intentions.[10] For example, the Indian government deceived the U.S. Intelligence Community before the former's 1998 nuclear test. Through a 1995 demarche from the U.S. government, the Indian government knew what indicators the U.S. sought and was able to obscure them until after the test. Then, the Indian government boasted of its success.[11]

Abduction forces a close consideration of the evidence at hand. Given competing estimates – such as "war is imminent" or "an exercise will occur" – the body of facts and inferences must be examined to determine "whether there are facts which falsify one of the estimates."[12] Only then can an assessment of accuracy be determined. Even then, the selected estimate remains only the "most likely."[13]

Despite their individual limitations, induction, deduction, and abduction taken together offer a means of thoroughly examining evidence in order to arrive at accurate intelligence conclusions. However, as becomes obvious from studying figure 1, in order to be successful, intelligence analysis requires something more: an overarching framework is needed to ensure reasoning relies on valid assertions, is not fallacious, and is self–consciously objective. Critical thinking provides that framework by ensuring that each form of reasoning is appropriately used. Critical thinking extends to the entire intelligence analysis process. The claim here is that analysts who

---

10 Isaac Ben-Israel explores the duality of estimation in considerable detail. See "Philosophy and Methodology of Intelligence: The Logic of the Estimate Process, *Intelligence and National Security* 4, no. 4 (October 1989), 660–718. Cited hereafter as Ben-Israel, "Logic of the Estimate Process."

11 Paul J. Raasa, "The Denial and Deception Challenge to Intelligence," in Roy Godson and James J. Wirtz, *Strategic Denial and Deception* (New Brunswick, NJ: Transaction Publishers, 2002), 178, 223–224.

become better critical thinkers will improve their analyses, helping to lessen the likelihood of intelligence failures. In the example above, critically thinking analysts would have questioned the generalizing of their initial conclusion by asking, "Was all the HUMINT from Cuba *really* false?" To avoid the tautological problem of equating quality analysis with the concept of "critical thinking" requires a careful assessment of cognition in the intelligence environment. The underlying question is "How can the intelligence analysts to whom Lowenthal's epigraph refers be 'really good'?"

Defining Critical Thinking

Defining critical thinking is a first step to understanding how it contributes to intelligence analysis. Richard Paul and Linda Elder, of the Foundation for Critical Thinking, consider it to be

> that mode of thinking – about any subject, content, or problem – in which the [solitary] thinker improves the quality of his or her thinking by skillfully taking charge of the structures inherent in thinking and imposing intellectual standards upon them.[14]

In other words, critical thinking is both a deliberate meta-cognitive *(thinking about thinking)* and cognitive *(thinking)* act whereby a person reflects on the *quality* of the reasoning process simultaneously while reasoning to a conclusion. The thinker has two equally important goals: improving the way she or he reasons and coming to a correct solution.[15]

To accomplish these goals, the reasoner requires assisting structures. Paul and Elder define eight elements of reasoning, shown in figure 2. These elements lead thinkers to ask focused questions about the topic being considered and the thinking process itself. Paul and Elder assert that whenever people reason, they do so for a purpose. This reasoning exists within a point of view and is shaped by both conscious and unconscious assumptions. Reasoning involves the creation of inferences based on conceptual frameworks about reality. These inferences are generated as people consider evidence necessary to answer questions or solve problems. Further, reasoning leads to decision points with implications – things that might happen

14 Richard Paul and Linda Elder, *The Miniature Guide to Critical Thinking Concepts and Tools*, 4th Edition (Dillon Beach, CA: The Foundation for Critical Thinking, 2004), 1. Cited hereafter as Paul and Elder, *Concepts and Tools*.

15 Exactly what is the "correct solution" is issue and context dependent. What is important here is that the process of reasoning is enhanced.

– *and* consequences – things that do happen once the decision has been made. Finally, Paul and Elder insist that "learning to analyze thinking requires practice in identifying the structures in use."[16]

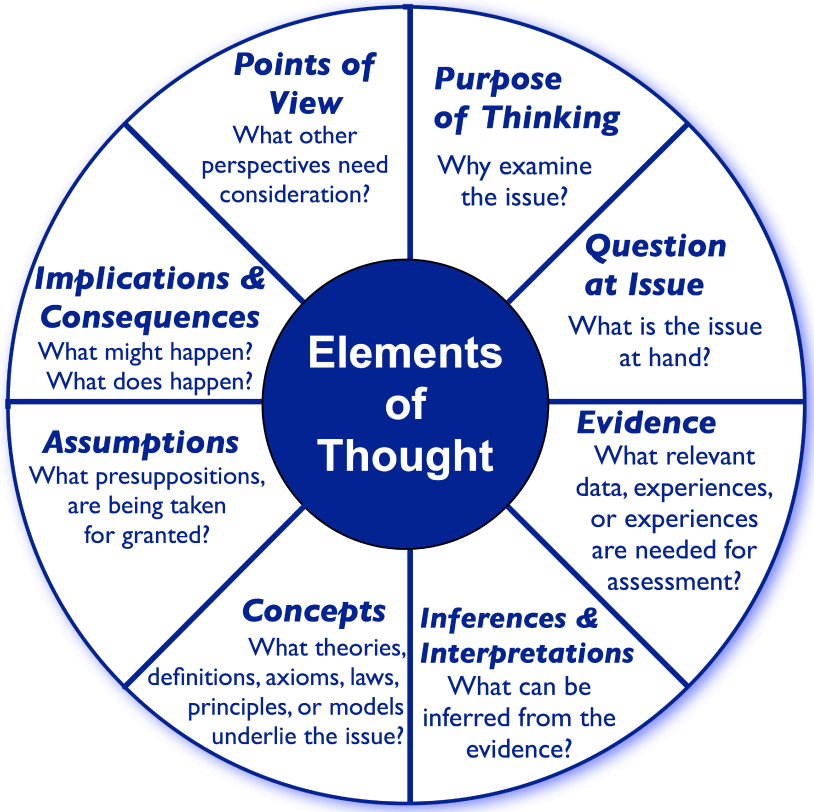

Figure 2: Elements of Thought

Standards for Critical Thinking

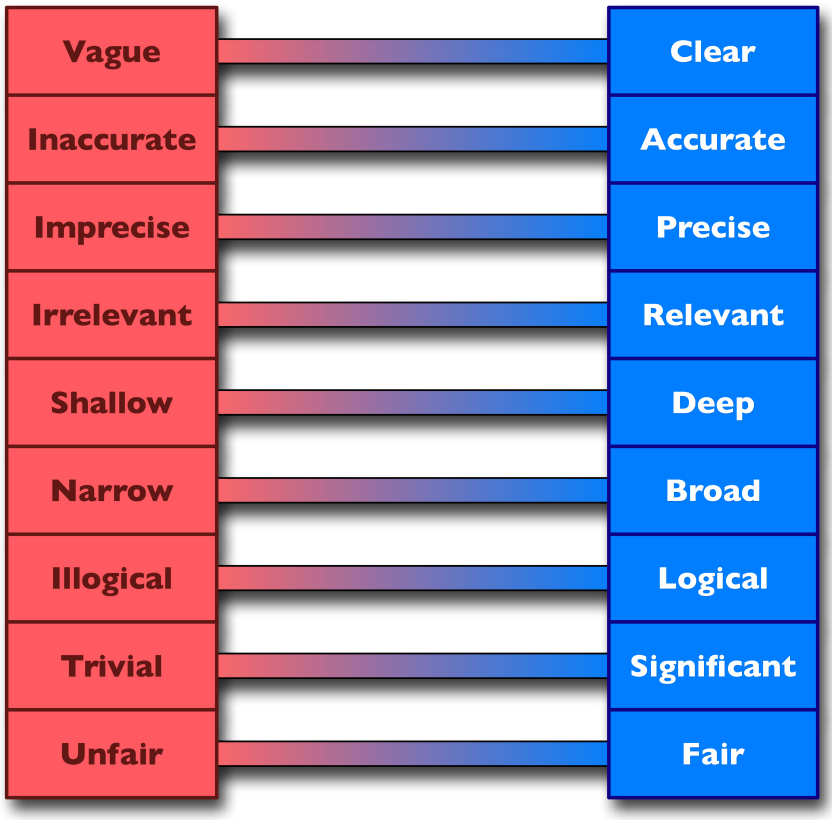

Figure 3: A Continuum of Intellectual Standards

Source: Derived from Paul and Elder, *Concepts and Tools*, 9.

Paul and Elder also establish a set of intellectual standards that offer criteria for assessing the level and quality of thinking. These form a continuum as shown in figure 3.[17] Active – or Socratic – questioning in a social setting becomes the means of critically exploring a topic or discipline as well as assessing the thinking on that topic. Questions assessing the issue delve into purpose, assumptions, inferences, as well as points of view on a topic.[18] Paul and Elder's

17 Elder and Paul, *Analytic Thinking*, 1–17.

18 Paul and Elder, *Concepts and Tools*, 2–9.

approach ensures that a topic or issue is thoroughly, logically, and objectively developed. Their continuum provides qualitative metrics to inform the thinker and others who may evaluate the object of the thinking along with the process employed. Each standard is related to but independent of the others. The object of consideration might be vaguely or clearly presented. But it also might be inaccurate. An example of this would be "the world is flat." This clear statement of reality is false.

The reasoning or its object might be clearly and accurately presented but remain imprecise, the level of detail required depending on the issue itself. Precision becomes important in assessing the location of an adversary or a threat as in "terrorists placed the improvised explosive device (IED) near the highway."

It is possible to create clear, accurate, and precise answers that are irrelevant. If one is considering the IED along the highway but the issue is how best to fly the troops in question from one location to another then the answer is irrelevant. Similarly, topics and their accompanying reasoning need to consider both the complexities involved (depth) and other points of view (breadth).[19] Such reasoning becomes essential when systems must be assessed because in systems "chains of consequences extend over time and many areas: The effects of action are always multiple."[20] Intelligence often must assess such systems – terrorist networks are but one example. Additionally, as sociologist Emile Durkheim observes, the combinations of elements related to an issue "combine and thereby produce, by the fact of their combination, new phenomena."[21]

When the correct phenomena or questions – and related alternative explanations – are not fully considered, intelligence failures occur. For instance, the Senate Select Committee on Intelligence

19 Elder and Paul, *Analytic Thinking,* 7.

20 Robert Jervis, *System Effects: Complexity in Political and Social Life* (Princeton, NJ: Princeton University Press, 1997), 10. Cited hereafter as Jervis, System Effects.

21 Emile Durkheim, *The Rules of Sociological Method* (Glencoe, IL: Free Press, 1938), xlvii.

found such reasoning to be among the causes of the Intelligence Community's failure to assess accurately Iraq's alleged programs to develop weapons of mass destruction (WMD). The senators noted that "Intelligence Community managers…did not encourage analysts to challenge their assumptions, fully consider alternative arguments, accurately characterize the intelligence reporting, or counsel analysts who lost their objectivity."[22]

Logic and significance also come into play. If the evidence presented does not imply the conclusions then the results are illogical. Focusing on appropriate evidence maintains significance. For example, evidence that terrorists who place an IED also have Stinger surface–to–air missiles bears on how troops can move across hostile territory.

Fairness deals with the agendas – hidden and expressed – of the thinker, her collaborative peers, and her customers. Knowing who has a stake in an issue as well as the stakes themselves helps ensure that issues are fairly reasoned and presented. Such considerations also reflect the analyst's own biases or opinions. In considering this point, Paul and Elder offer the evaluative question, "Am I misrepresenting a view with which I disagree?"[23]

Finally, while getting to the right-hand side of the spectrum on each of these standards in figure 3 is highly desirable, the standard of thinking on an issue will vary based on the skills of the thinkers and the issues under scrutiny. Assessing the resulting shortfalls in thinking reveals gaps that can be corrected. The continuum therefore provides a detailed assessment by which thinking on issues can be improved.

Skill-Based Definitions

Other approaches to defining critical thinking focus on the specific skills. For example, Diane Halpern considers that

> [critical] thinking is the use of those cognitive skills or strategies that increase the probability of a desirable outcome. It is… thinking that is purposeful, reasoned, and goal directed – the kind of thinking involved in solving problems, formulating inferences, calculating likelihoods, and making decisions, when the thinker is using skills that are thoughtful and effective to the particular context and type of thinking task.[24]

Additional advocates of skills-based critical thinking include Edward Glaser and Alec Fisher, and their sets of critical thinking skills include a number of elements common to those identified by Halpern. The overlapping competencies of critical thinkers as advanced by Paul and Elder and these three other proponents are summarized in table 1. The comparison reveals the completeness of the Paul and Elder model.

These competencies assist intelligence analysts who contribute to the solution of threats to national security by ensuring the formulation of sound inferences about adversarial capabilities and intentions. Resulting findings are disseminated in reports that are often referred to as "assessments." At their best, they offer choices to decision-making consumers, as well as a clear outline of the implications of those choices.[25]

---

24 Diane Halpern, *Thought and Knowledge: An Introduction to Critical Thinking*, 4th Edition (Mahwah, NJ: Lawrence Erlbaum Associates, Publishers, 2002), 37. Cited hereafter as Halpern, *Thought and Knowledge.*

25 The term "assessment" describes the result of an intelligence production process but is not universally used within the Intelligence Community. Assessments are created at the Central Intelligence Agency and at the Defense Intelligence Agency. Other names for the reports that analysts produce include "products" at the National Security Agency (NSA) and "estimates" at the National Intelligence Council (NIC). Regardless of how they are named, they record and disseminate the results of analysts' work.

Competencies of Critical Thinkers	Paul and Elder	Fisher	Glaser	Halpern
Recognize problems or questions and find effective means of solution	✓		✓	✓
Engage in meta-cognitive activities that identify assumptions, biases, and performance as solutions are developed	✓	✓	✓	✓
Interpret data, appraise evidence, and evaluate statements in order to recognize logical relationships between propositions	✓		✓	✓

A Disposition to Think Critically

It is not enough merely to know the skills needed for critical thinking. To be successful, analysts as critical thinkers also need "certain attitudes, dispositions, passions, [and] traits of mind."[26] Actively thinking critically hones the skills; practice yields proficiency. But in order to gain mastery, willingness to reason in this manner becomes essential. The importance of this disposition to critically think cannot be over-emphasized. According to Peter A. Facione, Noreen C. Facione, and Carol A. Giancarlo, "Empirical studies…at multiple sites indicate that for all practical purposes" both critical thinking skills and the disposition to critically think are essential.[27]

There are a number of characteristics associated with the disposition to think critically. The Faciones and Giancarlo identify "seven characterological attributes or habits of mind… truth-seeking, open-mindedness, analyticity, systematicity, critical thinking, self confidence, inquisitiveness, and maturity of judgment."[28] According to Richard Paul and Gerald Nosich, the characteristics of critical thinkers include

> thinking independently, exercising fair-mindedness, developing insight into egocentricity and sociocentricity, developing intellectual humility and suspending judgment, developing intellectual courage, developing intellectual good faith and integrity, developing intellectual perseverance,

developing confidence in reason, exploring thoughts underlying feelings and feelings underlying thoughts, developing intellectual curiosity.[29]

Both sets closely match the characteristics of successful intelligence analysts identified by Lisa Krizan and the author in their work on intelligence analysts' core competencies. Krizan and the author observe that successful intelligence analysts are insatiably curious. Fascinated by puzzles, their high levels of self-motivation lead them to observe and read voraciously, and to take fair-minded and varied perspectives. This helps them to make the creative connections necessary for solving the hardest intelligence problems. Finally, the emotional tensions created by problems, and the cathartic release at their solution, powerfully motivate analysts.[30]

In addition, emotions play a significant part in the process of critical thinking. As adult learning expert Stephen Brookfield observes, "[emotive] aspects – feelings, emotional responses, intuitions, sensing – are central to critical thinking."[31] He argues that the consideration of alternatives "to one's current ways of thinking" characterizes the approach.[32] Indeed, the consideration of these alternatives requires creativity, which he considers a non–rational form of thought.[33] Creative reasoning generates hypotheses; it has contributed significantly to the development of intellectual, scientific, and technological knowledge.

The Role of Questions

Greg Treverton observes that in intelligence the right questions rarely get asked.[34] Yet, critical thinking offers a means by which at least *appropriate* questions may be raised. The combination of critical thinking skills and the disposition to think critically focuses and directs inductive, deductive, and abductive reasoning to solve problems. This is an interrogative paradigm. Critical thinking involves questioning that forces broader consideration of issues and problems as well as the various means of resolving or answering them. Such questioning happens at both the individual and collective levels as shown in figure 4.

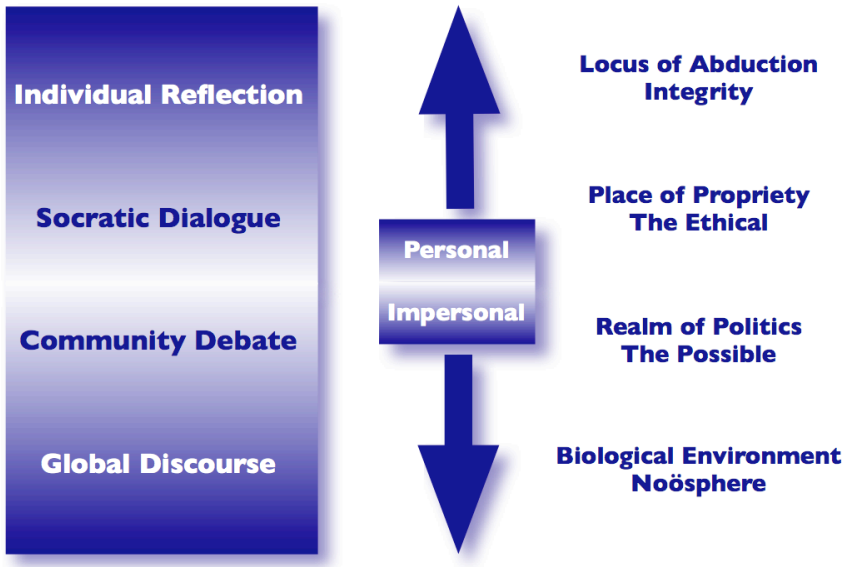

Figure 4: Levels of Questioning: Critical Thinking in a Social Setting

Source: Created by the author with contributions by Russell G. Swenson.

Questioning is either personal or impersonal and ranges from the musings of the individual critical thinker to that of a global discourse. As an individual ponders problems and issues, she abduces the most likely explanations. Moving up a level, questioning becomes a

34 Greg Treverton, conversation with the author, 18 April 2006.

hierarchical dialogue within dyads or larger assemblies. A critically thinking questioner ferrets out answers from others within the group. The process generates new questions that are answered in turn – and in turn, raise further questions. At the level of a community debate, critical thinkers explore what is possible politically and within the community's purview. Ideally, the relationship between thinkers is peer-to-peer. Finally, questions addressed within the context of a global discourse take into account the entire biological landscape (noösphere).[35]

Such questioning produces new and creative thinking, analogous to switching from Newtonian to quantum physics. In this analogy, an atomistic approach to analysis gives way to the associative impulse of synthesis as structured thoughts facilitate a leap to new questions, ideas, and possibilities. This overarching framework of structured reasoning frames questions to help analysts decide the best means or best combination of means that are suited to solving specific intelligence problems. The questions serve to alert an analyst to the notion that she might be deceived, or that she needs to employ some other means of reasoning to determine which of several alternative outcomes is most likely. These questions provide a formal means by which an analyst confronts her biases about likely outcomes. Therefore, in the context of intelligence analysis, critical thinking becomes one of the most – if not *the* most – important skills of the analyst. Facing symmetric and asymmetric threats, analysts have a potent and powerful tool to facilitate their asking the right questions in the process of improving their understanding of the problem at hand as well as their own reasoning about that problem.

Pseudo-Critical Thinking

It is important to understand what critical thinking is *not*. Critical thinking, as has been noted, focuses on both the process and the results of reasoning. However, the term is also used in reference to reasoning that is not reflective. The application of formal logic is sometimes (incorrectly) equated to critical thinking. So too are

35 Wikipedia defines the noösphere as the domain of human thought. Wikipedia, entry under "noösphere," accessed 27 February 2006.

problem solving and structured methods of analysis. Developers of school curricula and other exponents of "sound thinking" often lay claim to the mantel of critical thinking but are really leveraging their coverage of logic or problem solving to capitalize on an uncritical understanding of what critical thinking is. Problem solving, for example, focuses on answers and not on the process by which an answer is obtained. Additionally, logic or problem solving, being goal oriented, offer little means by which a person can improve the process of her thinking. The following problem is a typical example of pseudo–critical thinking:

> Two cyclists race along a straight course. The faster of the pair maintains an average speed of 30 mph. The slower cyclist averages 25 miles per hour. When the race ends, the judges announce that the faster cyclist crossed the finish line one hour before the slower racer. How many miles long was the racing course?[36]

This example (and others like it) focuses on the answer, provides no guidance on the process, and ignores any improvement in reasoning skills. Solvers either figure it out through trial and error or by following a rule-based strategy learned by rote. Therefore it fails to be critical thinking.

Unless the process, and the means, to improve a person's reasoning are emphasized, then at best such examples teach structured problem solving. At worst, they deal merely in criticism; they fail to assist people to learn to reason better. Central to critical thinking are the twin foci on the way in which a person is reasoning and the goal of improving that process. One could easily infer that misconceptions about critical thinking could be associated with what is taught as critical thinking in American educational institutions.[37]

What Can Be Learned from the Past? Thinking Critically about Cuba

Examining past intelligence successes and failures in light of new developments provides a means to reassess what happened and how outcomes could have been different. The case of the Soviet missiles in Cuba in the summer and fall of 1962 provides a means of examining how critical thinking and structured methodologies could have made a difference.

Deploying the Missiles

During the summer of 1962, CIA analysts received a spate of potentially alarming reports about Russians being seen in Cuba. The reports, however, were only part of a stream of similar, "farfetched tales of African troops with rings in their noses, lurking Mongolians, and even Chinese troops" on the island.[38] Most or all of these reports were discounted by analysts who were inured to spurious reports of Soviet equipment secreted away in caves.[39]

James Hansen – who worked in both the Central Intelligence Agency (CIA) and Defense Intelligence Agency (DIA) – posits that the U.S. Intelligence and Policy Communities were the victims of a concerted Soviet campaign of denial and deception that masked the deployment of Soviet forces and missiles into Cuba.[40] The deception campaign even included "accurate information about the deployment [leaked] so as to mask it."[41] As Raymond Garthoff relates, "there were literally thousands of reports of missiles in Cuba in the period *before* any missiles were actually brought there."[42]

42 Raymond L. Garthoff, "US Intelligence in the Cuban Missile Crisis," in

In fact, the Soviets were able to deploy more than the offensive nuclear missiles that became the centerpiece of the subsequent crisis with the United States. While U.S. analysts and policymakers knew of the conventional weapons, they were blind to the presence of SS-4 Medium Range Ballistic Missiles (MRBM) and SS-5 Intermediate Range Ballistic Missiles prior to the U-2 overflights of 14 October. Additionally, it seems they never discovered the presence of approximately 100 tactical nuclear weapons deployed on the island.[43] There is debate whether U.S. Intelligence also *underestimated* the number of Soviet troops deployed to Cuba. Garthoff reports that one CIA unit concluded there were between 45,000 and 50,000 Soviet troops in Cuba (the actual number was about 42,000) but the official estimate was between 4,500 and 5,000 prior to the crisis.[44]

The Soviets employed an elaborate campaign of denial and deception that took advantage of American points of view about the likelihood of Soviet weapons being located in Cuba. As Robert Jervis makes clear,

> the U.S. did not expect the Russians to put missiles into Cuba or Japan to attack Pearl Harbor because American officials knew that the U.S. would thwart these measures if they were taken. These judgments were correct, but because other countries saw the world and the U.S. less accurately, the American predictions were inaccurate.[45]

It could have been worse. As Gil Merom writes, the Soviets might

43 Garthoff, "US Intelligence," 29.

44 Garthoff, "US Intelligence," 28, 58. U.S. Intelligence never did reach a correct conclusion. The closest they got was an estimate of 22,000 troops in early 1963 (Garthoff, "U.S. Intelligence," 28).

45 Robert Jervis, *System Effects: Complexity in Political and Social Life* (Princeton, NJ: Princeton University Press, 1997), 45. Jervis draws on the work of Klaus Knorr. See Klaus Knorr, "Failures in National Intelligence Estimates: The Case of the Cuban Missiles," *World Politics* 16 (April 1964): 455–67.

have *completed* the bases and "threatened major U.S. cities with extinction."[46] The threat is brought home by figure 5.

What caused U.S. analysts to get it wrong? Apparently the U.S. analysts concluded that because some of the HUMINT evidence was ludicrous, all of it was. This inductive conclusion then led them to discount further evidence. For example, having concluded that all the previously considered Cuban HUMINT was false, each new piece, *since it came from Cuba,* also had to be false. Thus, a false inductive conclusion led subsequently to false deductive conclusions.[47] It does not appear that abductive reasoning strategies were ever employed.

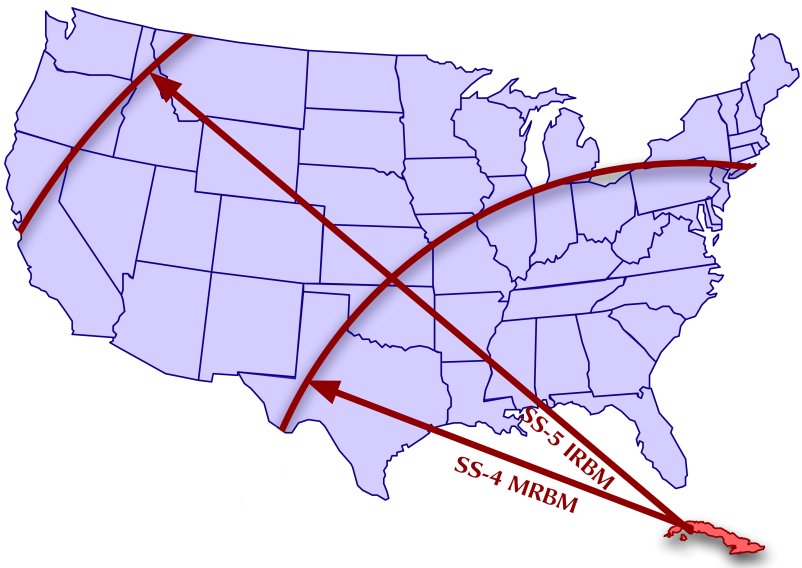

Figure 5: Respective Ranges of Soviet SS-4 MRBM and SS-5 IRBM Missiles

Source: Derived from Hansen, "Soviet Deception," 49.

46 Gil Merom, "The 1962 Cuban Intelligence Estimate: A Methodological Perspective," *Intelligence and National Security* 14, no. 3 (Autumn 1999), 49. Cited hereafter as Merom, "Estimate."

47 Inductive and deductive reasoning were illustrated in figure 1.

It should be noted that the U.S. Intelligence Community was not blind to the possibility that the Soviets might conduct a military buildup in Cuba. In fact, there were two theories being debated: One, that the Soviets would emplace *defensive* weapons, and the other that they would emplace *offensive* weapons. Senior analysts in the Intelligence Community held the former theory while John McCone, then Director of Central Intelligence, favored the latter.

Part of McCone's reasoning had to do with the cost and utility of the installation of SA-2 air defense missiles. McCone apparently reasoned that the purpose of installing such expensive missiles had to be greater than merely denying the United States overflight capabilities (the SA-2 could shoot down – as Francis Gary Powers discovered – a U-2).[48] This led McCone to come "up with an answer that no one wanted to hear: the SA-2s were on the island to deny the United States the capability to see the construction of offensive missile installations."[49]

Unfortunately, McCone was unable to dissuade the majority from their point of view. This may have stemmed, as James Blight and David Welch write, from the realization that while McCone's inference seemed reasonable when viewed in hindsight, in foresight it was faulty because it failed to sufficiently cover the alternatives.[50] Blight and Welch observe that

> the Soviets had also deployed SA-2 missiles to Egypt, Syria, and Indonesia, and in none of those cases had they also deployed strategic nuclear weapons. Indeed, the US intelligence community [sic] expected that the Soviet Union

48 Thomas R. Johnson and David A. Hatch, *NSA and the Cuban Missile Crisis* (Fort Meade, MD: National Security Agency Center for Cryptologic History, 1998), URL: <http://www.nsa.gov/publications/publi00033.cfm>, last accessed 18 April 2006. Cited hereafter as Johnson and Hatch, *NSA*.

would deploy SA-2 missiles to Cuba, precisely because it had done so elsewhere.[51]

Even though history proved McCone to be correct (for the wrong reasons), the defensive weapons theory predominated.[52]

The Soviets took advantage of the American beliefs and faulty reasoning. Capitalizing on the idea that it is easier to lead a target astray than to try to change his mind, they successfully placed the nuclear missiles in Cuba.[53] Heuer observes that

> [deceptions] that follow this principle seldom fail, for the odds are then strongly in favor of the deceiver. The human capacity to rationalize contradictory evidence is easily sufficient to outweigh the pernicious effects of security leaks and uncontrolled channels of information that planners of deception…might compromise their efforts.[54]

Assessing the Implications

Exactly what happened in the Cuban case and does it apply to contemporary issues? Roberta Wohlstetter notes in retrospect, "We would like to know not only how we felt, but what we did and what we might have done, and in particular what we knew or what we could have known."[55] Wohlstetter's musings lead to two key questions for analysts: How could this successful deception campaign have been

51 Blight and Welch, *Intelligence and the Cuban Missile Crisis*, 5.

52 Merom, "Estimate," 58.

53 Richards J. Heuer, Jr., "Strategic Deception and Counterdeception: A Cognitive Process Approach," *International Studies Quarterly* 25, no. 2 (June 1981), 200. Cited hereafter as Heuer, "Strategic Deception." It is interesting to speculate whether the Soviets had a feedback channel that informed them of the predominant theory.

54 Heuer, "Strategic Deception," 200.

55 Roberta Wohlstetter, "Cuba and Pearl Harbor: Hindsight and Foresight," *Foreign Affairs* 46, no. 3 (July 1965), 691. Cited hereafter as Wohlstetter, "Cuba."

thwarted? What can be learned to advise analysts about current adversarial denial and deception?

Simply looking at additional evidence is sometimes promoted as a means of detecting denial and deception by adversaries. In the Cuban case, however, analysts had already processed a superabundance of evidence. Wohlstetter suggests that such riches can be "embarrassing."[56] This is because even as "signals" point

> to the action or to an adversary's intention to undertake it, "noise" or a background of irrelevant or inconsistent signals, [and] signs pointing in the wrong directions…tend always to obscure the signs pointing the right way.[57]

HUMINT assets overwhelmed analysts' abilities to distinguish signals from noise. Heuer and Hansen agree that once "locked in," analysts resist changing their minds. More evidence alone fails to change an analyst's mind because "[new] information is assimilated to existing images."[58] Yet, analysts stand to benefit from changing their opinion in the face of disconfirming evidence.

The limitations of hindsight analysis notwithstanding, if analysts had employed critical reasoning in 1962 they could have detected the Soviet *maskirovka* in Cuba. For example, by applying Paul and Elder's model of critical thinking, analysts would have had a means to question their assumptions and points of view, and subsequently might have questioned the purpose of the apparent "noise" they were discounting as well as their assumptions about the prevalent point of view that the Soviets would not place missiles on the island because we would react. Gil Merom suggests that some appropriate questions would have included: "How aware were the analysts of their own assumptions? Were these assumptions sensible and was it sensible to adhere to them?"[59] Other considerations that critical

56 Wohlstetter, "Cuba," 691.

57 Wohlstetter, "Cuba," 691.

59 Merom, "Estimate," 57.

thinking about the crisis might have raised are included in table 2. Applying Paul and Elder's model reveals other considerations that conceivably would have led to an earlier detection of the likelihood of the deployed weapons being *offensive.*

Would this approach have allowed detection of what the Soviets were doing in Cuba before mid-October 1962? One could argue counterfactually that it might have enhanced analysis of collection from other sources.[60] SIGINT assets capable of collecting Russian communications were in place near the island.[61] Imagery assets might have been tasked differently prior to 14 October. Sources less subject to generating noise would have introduced inconsistencies to an analysis of competing hypotheses that was solely HUMINT-based.

Between Dogmatism and Refutation

A systematic approach to directed collection also would have moved analysts toward a disconfirmatory analytic approach. By contrast, a confirmatory approach, often characterized as confirmation bias, leads analysts to accept what they set out to confirm.[62] A disconfirmatory approach aims to refute alternative

---

60 Counterfactual reasoning explores differing outcomes arising from alternative causes. Counterfactuals are commonly used in whenever alternate hypotheses are explored. They are essential for both post-mortem reviews and futures scenario exercises. See Philip E. Tetlock, and Aaron Belkin, *Counterfactual Thought Experiments in World Politics: Logical, Methodological, and Psychological Perspectives* (Princeton, NJ: Princeton University Press, 1996), 1–38. In the same volume, Richard Ned Lebow and Janice Gross Stein conduct a counterfactual review of the Cuban missile crisis. See Richard Ned Lebow, and Janice Gross Stein, "Back to the Past: Counterfactuals and the Cuban Missile Crisis," in Philip E. Tetlock, and Aaron Belkin, *Counterfactual Thought Experiments in World Politics: Logical, Methodological, and Psychological Perspectives* (Princeton, NJ: Princeton University Press, 1996), 119–148.

61 Johnson and Hatch, *NSA*. According to the authors, SIGINT played a key role in determining the operational status of the SA-2 air defense missiles. However, SIGINT failed to detect the delivery and installation of the nuclear missiles.

62 Wikipedia defines confirmation bias as "a type of cognitive bias toward confirmation of the hypothesis under study." (Wikipedia, entry under "confirmation bias").

Purpose	· Determine what is going on in Cuba as a part of the U.S. "war" against Castro and the Cuban communists.
Key Questions	· If this really is a Soviet military buildup, what kinds of weapons are being deployed: offensive weapons or defensive weapons? · Why is an expensive missile system like the SA–2 being installed in Cuba? · What is the SA–2 really protecting? · Does a crisis exist?
Evidentiary Considerations	· If defensive weapons are being deployed, what evidence should be observed? · If offensive weapons are being deployed, what evidence should be observed? · What is not being seen?
Inferences	· What is inferred from the observed and collected evidence?
Assumptions	· What is being assumed about the evidence? · What is being assumed about the sources of the evidence? · What is being assumed about why the Soviets would deploy weapons to Cuba?
Concepts	· How does human perception affect the analysis? · How reliable are the sources of evidence? (Could also be an assumption.)
Implications and Consequences	· If conclusions are incorrect about the Soviet build up, what might occur next? · If conclusions are correct about the Soviet build up, what can be expected? · If conclusions are incorrect about offensive weapons being deployed, what happens next? · If conclusions are incorrect about defensive weapons being deployed, what happens next?
Points of View	· What other points of view about what is going on in Cuba exist?

Table 2: Applying Paul and Elder's Critical Thinking Model to the Situation in Cuba, August–September 1962.

Source: Developed by author.

hypotheses. Whatever was left at the end of the process would be the most likely explanation. Would this guarantee a correct "answer"? Ben-Israel concludes that although the answer has to be "no," the approach does allow for narrowing "the margin of error."[63] It does so by moving the analyst away from a "pole of dogmatic tenacity" toward a "pole of refutation" (summarized in figure 6).[64]

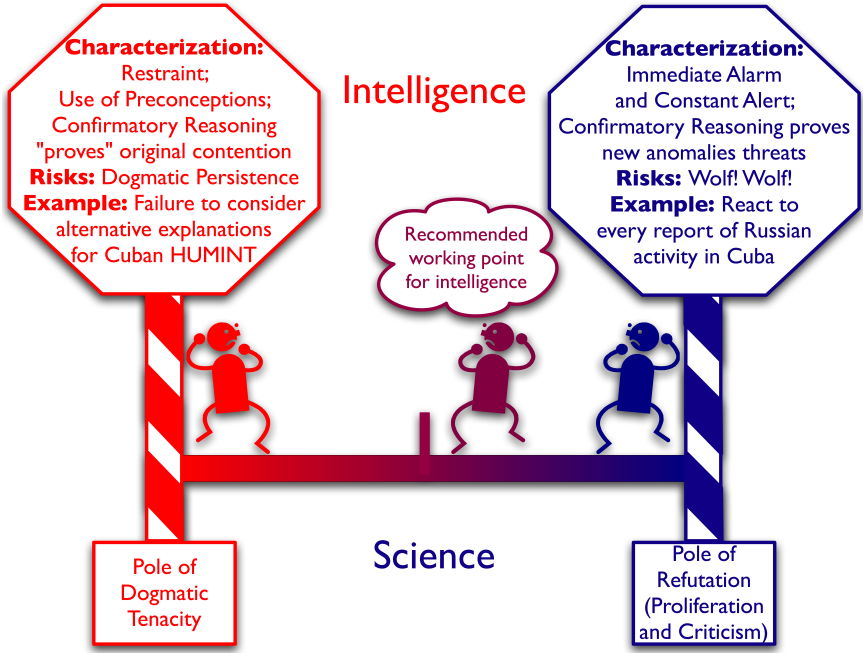

Figure 6: A Place for Analysis between Dogmatism and Criticism

Source: Derived from Ben-Israel, "Methodology of Intelligence," 679.

It should be noted that operating too closely to a pole of refutation can also create problems. For example, analysts might be unable to distinguish between real threats and false positives; they might react to each one regardless of its validity. In the Cuban case, this problem would have manifested itself in goading continual U.S. military reactions to every perceived Soviet and Cuban threat. Here again,

63 Ben-Israel, "Logic of the Estimate Process," 679

64 Ben-Israel, "Logic of the Estimate Process," 691.

critical thinking could moderate this Cassandrian approach.[65] The questioning of assumptions and points of view in critical thinking allows analysts to *discount* certain evidence. Based on his own Israeli intelligence analyst experiences, Ben-Israel asserts that anchoring oneself some distance from a pole of refutation, and not far from the center, is probably best.[66] In other words, enlightened skepticism probably works as a method for distinguishing between real and perceived threats. Critical thinking leads one to assess the processes one is using and the point on the continuum from which to work.

Lacking: Disconfirmation

Merom confirms that a disconfirmatory process did not occur on the Cuban missile problem: "Information that was inconsistent with the prevailing conservative theory was not considered as alarming and necessitating revision, but rather was 'rehabilitated' and rendered 'harmless' on the basis of *ad hoc* statements."[67] Instead, inductive reasoning generally led analysts to "prove" their theory and subsequently to adhere to it "*until it was proven wrong* by conclusive hard evidence" – the U–2 photos, to be exact (of which a detail is reproduced in figure 7).[68]

---

65 Cassandra was the daughter of Priam, King of Troy. She was blessed and cursed by the god Apollo to accurately predict the future yet never be believed. In intelligence, a Cassandrian approach is characterized as one that emphasizes dire outcomes and worst–case scenarios. Analysts who produce such assessments are often discounted and rarely thanked when they are correct. For a real account of how such warnings are perceived (at least at the time they are made), see Charles E. Allen, "Intelligence: Cult, Craft, or Business?" in *Seminar on Intelligence, Command, and Control, Guest Presentations,* Spring 2000 (Cambridge, MA: Harvard University Program on Information Resources Policy, I–01–1, April 2000), URL: <http://www.pirp.harvard.edu/pubs.html>, last accessed 11 January 2006.

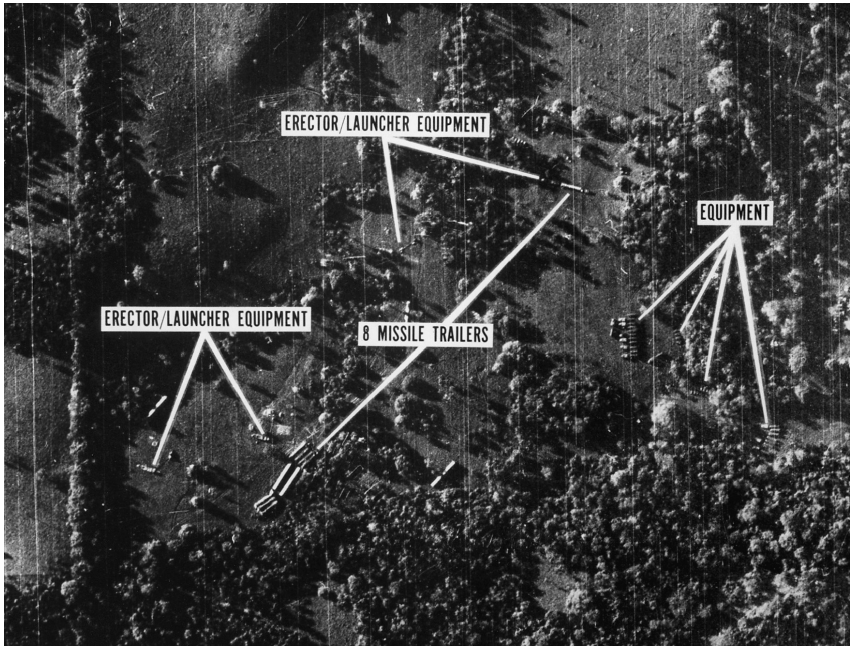

Figure 7: Detail of a U-2 Photograph of an SS-4 MRBM Launch Site, San Cristobal, Cuba, 14 October 1962. This evidence confirmed that Soviet missiles were being installed in Cuba.

Source: U.S. Department of Defense, photograph in the John Fitzgerald Kennedy Library, Boston, MA, PX 66–20:7 14 October 1962.

What tipped off the overhead surveillance were two HUMINT reports of "a Soviet truck convoy that appeared to be towing ballistic missiles toward the San Cristobal area."[69] That these reports were taken seriously is one of the curious serendipities that occur from time to time in intelligence analysis (and other research-based domains). What prompted the CIA and DIA analysts to take these reports seriously while earlier accounts had been dismissed remains a mystery. Garthoff asserts that it was new information taken in context with the observed "pattern of SA-2 surface-to-air missile sites in Western

69 Graham Allison and Philip Zelikow, *Essence of Decision: Explaining the Cuban Missile Crisis,* 2nd Edition (New York, NY: Longman, 1999), 220. Cited hereafter as Allison and Zelikow, *Essence of Decision.* Raymond Garthoff also notes this to be the case. See Garthoff, "US Intelligence," 23.

Cuba" that led to the tasking of the U-2 flight on 14 October (the track of which is shown in figure 8).[70]

Also contributing to the determination that the deployed missiles were SS-4 MRBMs was information transmitted to the British and American intelligence services by Oleg Penkovsky. While Penkovsky's espionage apparently did not warn the Americans that the Soviets were about to deploy offensive missiles in Cuba, he is credited with – among other things – providing technical information about the missiles.[71] Len Scott observes that Penkovsky provided the technical information that allowed the determination that the missiles were SS-4s instead of SS-3s, as well as information that allowed accurate assessment by the Americans of their readiness. Scott writes that this was important because

> the SS-3 had a range which US intelligence estimated at 630 nautical miles (nm), enabling coverage of seven Strategic Air Command (SAC) bomber/tanker bases; the 1020nm SS-4 could target 18 bomber/tanker bases (plus one ICBM complex), and some 58 cities with a population of over 100,000, including Washington, accounting for 92 million people.[72]

Shortly thereafter Penkovsky was detected, arrested, tried, and executed by the Soviets for his espionage.

72 Scott, "Penkovsky," 34. In making this assertion Scott draws on work previously published by Allison and Zelikow in *Essence of Decision* and by Mary S. McAuliffe, ed., *CIA Documents on the Cuban Missile Crisis, 1962* (Washington DC: Central Intelligence Agency, 1992).

Figure 8: U–2 Tracks over Cuba, 4–14 October 1962.

Sources: Map, Central Intelligence Agency. Tracks derived from a map in Mary S. McAuliffe, ed., *CIA Documents on the Cuban Missile Crisis, 1962* (Washington DC: Central Intelligence Agency, 1992), 3. Hereafter McAuliffe. Missile locations derived from Arthur C. Lundahl, "Additional Information – Mission 3102," Memorandum for Director of Central Intelligence and Director, Defense Intelligence Agency, 15 October 1962, in McAuliffe, 181–182; and Arthur C. Lundahl, "Additional Information – Mission 3107," Memorandum for Director of Central Intelligence and Director, Defense Intelligence Agency, 19 October 1962, in McAuliffe, 209. Track and missile locations are approximations. Lundahl was the Director, National Photographic Interpretation Center. The 19 October memo reports that a 5 September U–2 overflight did not detect the latter two missile sites. However, a review of the 5 September track (as presented in McAuliffe) shows the aircraft only came near the Sagua La Grande site. It should also be noted that the track of the U-2 – as flown on 14 October – deviated from the original planned route (which was farther to the west). The track as flown took the aircraft closer to the San Cristobal site. What might have happened had the original track been flown?

Despite their efforts at denial and deception, there was an evident lack of concealment of the missiles by the Soviets prior to their "discovery" on 14 October. General Anatoli Gribkov, a member of the Soviet General Staff in Cuba at the time relates,

> A missile–launching complex is not easily disguised…[Such] an installation…could be hidden from ground-level view. But from above, however, it could and did stick out like a sore thumb.[73]

Allison and Zelikow note that the Soviets only began to camouflage the sites *after* "the U.S. announced the discovery of the missiles and announced the blockade."[74] They conclude that the Soviet forces building the bases lacked personnel and resources to conceal them – a situation that apparently changed only after the missiles had been discovered.[75]

The Roles of Critical Thinking in the Cuban Crisis

Merom's critique of the Intelligence Community's estimate of Soviet intentions vis-à-vis Soviet weapons in Cuba reveals areas that would be well-served by critical thinking. First, when a critical thinking paradigm is in control, intelligence foraging and gathering are efficiently oriented. Questions are raised about the existing evidence – both anomalous and consistent – as well as where new disconfirming and confirming evidence might be discovered. Second, alternative – what in the context of Cuba, Merom calls *revolutionary* – theories are considered.[76] A structured process also speeds up the process of analytic sensemaking: estimates are crafted earlier.[77] Third, a methodological process opens analysis to "guiding principles of

---

73 Anatoli Gribkov, "The View from Moscow and Havana," in Anatoli Gribkov and William Y. Smith, *Operation ANADYR: U.S. and Soviet Generals Recount the Cuban Missile Crisis* (Chicago, IL: Edition Q, 1994), 39. Cited hereafter as Gribkov, "The View."

74 Allison and Zelikow, *Essence of Decision*, 208.

75 Allison and Zelikow, *Essence of Decision,* 214.

76 Merom, "Estimate," 71.

77 Structured processes provide a framework that reduces the flailing around as analysts seek to find a starting point for their analyses. Morgan Jones discusses this at some length. See Jones, *Thinker's Toolkit,* xi–xvi.

research," enriching both the process and the results.[78]

However, there are dangers to such a paradigm, especially as "science" commonly is understood. As Jeffrey Cooper notes, "a 'science of analysis' is a conceit, partly engendered by Sherman Kent's dominating view of intelligence as a counterpart of the scientific method."[79] Mark and Barbara Stefik argue that "the working methods of science and invention leaves [sic] out imagination. This makes it both boring and misleading."[80] Analysts must focus on both evidence and inferences; otherwise they can "get the details right at the cost of ignoring important inferential judgments that need to be conveyed in order to provide a true sense of the uncertainties of both evidence and judgment."[81] Here again, critical thinking, with its emphasis on creative questioning, moderates the process. Such questioning opens the way for imaginative thinking. "[Intuition], curiosity, and a thirst for discovery – all essential elements of good science" could have alerted analysts working in 1962 (or at any other time) to the possibility that they were being denied or deceived.[82]

An interesting intersection exists between critical thinking and analogy, or drawing comparisons to derive new patterns and explanations. This intersection lies at the heart of creativity.[83] According to Keith Holyoak and Paul Thagard, there are commonly four steps to analogical problem solving:

> Often a problem solver will select a source analog by retrieving information about it from memory (*selection*), map the source to the target and thereby generate inferences about the target

78 Merom, "Estimate," 57.

79 Cooper, Pathologies, 26..

80 Mark Stefik, and Barbara Stefik, *Breakthrough: Stories and Strategies of Radical Innovation* (Cambridge, MA: MIT Press, 2004), 110.

81 Cooper, *Pathologies,* 27.

82 Cooper, *Pathologies,* 31.

83 This statement illustrates just how pervasive and powerful the use of analogy is in human reasoning and discourse. Taken literally, creativity has no heart (nor any other organs) since it is a notion or a concept, not a living animal. Yet the analogy to a living being aids understanding.

(*mapping*), evaluate and adapt the inferences to take account of unique aspects of the target (*evaluation*), and finally learn something more general from the success or failure of the analogy (*learning*).[84]

Since analogy is such a powerful element in human reasoning, how can critical thinking outwit or control it? As developed in this paper, it does so by imposing a structure on the thinking. By examining inferences and implications as well as alternative points of view, critical thinking calls into question the appropriateness of the analogies in use. Recent work by Paul and Elder reveals how this works. They request, for example, that reasoners state and restate explanations, add examples, and then include an analogy.[85] While initial statements about a phenomenon *do not* imply understanding, restatement, examples, and analogies *do* and further, provide measures by which comprehension can be fixed and assessed; they make knowledge explicit – something that can be thought about.[86] When knowledge and reasoning are explicit, assumptions are revealed.

According to Richard Neustadt and Ernest May, it is known that analogy is a tool commonly invoked by policymakers.[87] Critically thinking analysts can add substantively to the policymakers' options by constructively challenging the tendency to rely upon analogy as a way of addressing situations. For example, Neustadt and May observe that in coping with the missile crisis in Cuba, President Kennedy and his advisers relied on – among other things – an analogy to Pearl Harbor to justify why a "surprise" bombing of the Soviet missile

84 Keith J. Holyoak and Paul Thagard, *Mental Leaps: Analogy in Creative Thought* (Cambridge, MA: The MIT Press, 1995), 15. Emphasis in original. Cited hereafter as Holyoak and Thagard, *Mental Leaps.*

87 Richard E. Neustadt and Ernest R. May, *Thinking in Time: The Uses of History for Decision Makers* (New York, NY: The Free Press, 1986). Cited hereafter as Neustadt and May, *Thinking in Time.*

bases was *not* a satisfactory option.[88] Kennedy's advisers, acting as analysts of the situation, critically evaluated the appropriateness of the analogy, pointing out its weaknesses and strengths. Kennedy concluded that sneak attacks were not a tactic lying within the U.S. tradition.[89]

In the Cuban case, getting analysts to restate their conclusions, provide examples, and make analogies would have revealed the strengths and weaknesses of their arguments about what they observed from the HUMINT sources. It would have shown their comprehension of what they wanted to conclude, revealed their assumptions and, in so doing, opened an avenue for "alternative" assessments of the issue. It would have done so by causing the analysts to question how it was that they failed to notice or ignore things.[90] The stage would have been set for an earlier, less risky, defusing of the impending crisis.

Another analogy employed in the Cuban missile crisis was the comparison to the Soviet position vis-à-vis the presence of *American* MRBMs in Turkey. A critical review reveals that the Soviet Union had tolerated the presence of these missiles – which had a longer range than those placed in Cuba – since 1957.[91] If the U.S. demanded the removal of the Soviet missiles from Cuba, was not a similar withdrawal of the American missiles from Turkey appropriate? Ultimately, this analogy provided a face-saving solution for the Soviet Union in the negotiations that followed. As a "secret" part of the agreement, the American Jupiter MRBMs were removed from Turkey five months after the Soviet Union removed its missiles from Cuba.[92]

Winners and Losers: The Crisis in Context

A Critical Assessment of the Leaders. In any confrontation there are winners and there are losers. Thinking critically about the confrontation over the Soviet missiles also involves determining who actually won as well as what the other outcomes might have been. Each of the three actors, Castro, Khrushchev, and Kennedy, had a number of interests at stake. In a number of circumstances each stood to gain at the expense of the others. What solutions were the most advantageous to each of the three actors? What were the motivating factors? A speculative – and admittedly simplified – critical comparison, again using Paul and Elder's model (summarized in table 3) illustrates how critical thinking also reveals much about who stood to gain and who stood to lose in the crisis.

Castro. Castro found his country under attack from the United States – both directly through economic sanctions and indirectly by Batista loyalists living in Florida.[93] The previous year the United States had launched an invasion attempt at the Bay of Pigs – which was repulsed. However the attempts by the United States to destabilize or overthrow the Cuban government did not end with their defeat. As Raymond Garthoff observes, "by the spring of 1962 the United States had embarked on a concerted campaign of overt and covert political, economic, psychological, and clandestine operations to weaken the Castro regime…including attempts to assassinate Castro."[94] In short, the United States was doing everything *except* conventional warfare to destroy Castro and his regime.

Castro's point of view was that the United States was a real enemy. He could reasonably assume that in light of its other activities and having attempted an invasion once, the United States would repeat its actions and this time *might* succeed (an implication). Another possible outcome that probably was considered was that war, conventional or nuclear, was likely. Castro must have possessed evidence of the military capabilities of the United States and probably inferred that

Element of Thinking	Considerations as seen from Castro's Point of View
Purpose	· Preserve Regime
Point of View	· United States threatens regime
Assumptions	· A second invasion will be attempted
Implications	· Invasion might succeed · War: conventional or nuclear
Evidence	· U.S. armed forces formidable
Inferences	· U.S. can overcome unaided Cuban forces.
Concepts	· Military strategy and doctrine, communist and capitalist theories
Key Questions	· How to deter United States from invading island

Table 3: A Comparative Assessment of Rival Motivations

Source: Developed by author.

Considerations	
as seen from Khrushchev's Point of View	as seen from Kennedy's Point of View
· Protect Cuba from United States · Force concessions from United States · Remove U.S. and NATO from Berlin · Spread Communism · Preserve Regime	· Get the missiles out of Cuba · Defend U.S. and allies against Communism · Preserve Regime
· United States a threat to Communism · Cuba threatened with invasion	· Communism threatens United States · Missiles are a threat
· Missiles in Cuba bargaining points · Missiles in Cuba protect Castro · Effort will be successful.	· Small Soviet Force · Strategy of removal is possible
· U.S. concessions ·War: conventional or nuclear	· Successful removal · Escalation of measures ·War: conventional or nuclear
· U.S. armed forces formidable	·Administration politically vulnerable over crisis · Khrushchev is a formidable adversary · Khrushchev is bluffing
· U.S. can overcome unaided Cuban forces. · Missiles provide necessary aid · United States will concede.	· Khrushchev will back down · Military option not required
· Military strategy and doctrine, communist and capitalist theories	· Military strategy and doctrine, communist and capitalist theories · Monroe Doctrine
· How to deter United States from invading Cuba · How to dominate the United States	· How to get the Soviets and their missiles off of Cuba

unaided, his own forces were no match for the U.S. forces. Underlying Castro's considerations were a number of ideas about military strategy and doctrine, as well as communist and capitalist theories. A corollary consideration commonly believed by many Americans (at the time and still today) might have been how Communism could have been spread across the Western Hemisphere, especially the United States. Castro's key question was, "How can I prevent the United States from invading again?"

Khrushchev. What motivated Khrushchev remains controversial. His motives certainly were more complex, as various explanatory hypotheses reflect. First, there is the argument that Khrushchev had an ally "in the faith" to protect. He too believed that the United States would invade Cuba a second time.[95] However, as Allison and Zelikow counsel, the troop buildup itself and *not* the nuclear missiles was what Khrushchev did to offset the perceived threat to Cuba from the United States.[96] The deployment of the nuclear missiles was related to some other issue.

Next, the situation posed an opportunity to force concessions from the United States – perhaps about Berlin, or the United States' own offensive missiles located in Europe and Turkey. Allison and Zelikow find sufficient evidence to lead them to believe that removing the U.S. and NATO troops from Berlin was a key factor motivating Khrushchev to deploy the missiles to Cuba.[97] Securing his borders from the American's Jupiter missiles may have been an additional motivating factor.

Additionally, there was Khrushchev's avowed purpose of spreading Communism across the globe. In this context the deployment of weapons lies within the context of "a great power rivalry… between the U.S. and the values and interests it represented…and

the Soviet Union's communist agenda."[98] At a reception for foreign ambassadors in Moscow in 1956, Khrushchev threatened, "Whether you like it or not, history is on our side. We [the communists] will bury you!"[99] This remark (among others) also reveals an additional purpose: Khrushchev, like all dictators, had to appear stronger than his adversaries – his political survival depended on it.

Khrushchev's point of view was that the United States (and its allies) were a threat to Communism everywhere and needed to be contained. He was presented with a confluence of opportunities and responded with the military buildup in Cuba and the deployment of the missiles. He apparently assumed that if he could get nuclear missiles into Cuba he'd have bargaining points useful in such a containment strategy. Later, Khrushchev believed he could effect a change in the balance of power between the two nations.[100] Possible outcomes included the prospect of further U.S. concessions, protection of Cuba from invasion, and either conventional or nuclear war.

Khrushchev had direct evidence drawn from the Korean War and possibly other evidence from spies operating in the United States about the capability of the U.S. military. Given the nuclear missiles he actually deployed as well as his assignment (temporary) of operational control of those missiles to the Soviet Group of Forces commander, General Issa Pliyev, Khrushchev seems to have inferred the U.S. forces were formidable.[101] He also apparently concluded that the missiles – and the other forces – would be adequate to the task of successfully satisfying his purposes; the United States, faced with

operational missiles in Cuba, would concede.[102] The concepts on which Khrushchev relied probably were the same as those on which Castro relied: military strategy and doctrine as well as communist and capitalist theories. Again, Khrushchev's key question mirrored that of Castro: How to keep the Americans from invading Cuba. Additionally, there could have been a second question on how to dominate, or at least gain concessions from, the United States.

Kennedy. Finally, there was Kennedy. While Kennedy's exact purpose vis-à-vis Cuba *prior* to the discovery of the missiles also remains unclear, it is known that he did not plan to invade the island during the summer and fall of 1962.[103] However, 1962 was an election year and the Kennedy administration was vulnerable with respect to Cuba.[104] Kennedy could not afford to appear soft on Communism. Kennedy also had an interest in keeping the U.S. and NATO forces in Berlin.

All this changed once the missiles were discovered. Kennedy's deliberations revolved around removing the missiles as expeditiously as possible. He no doubt realized that if his administration bungled the crisis they might lose at the polls in November.[105] Therefore, it is reasonable to conclude that Kennedy's goals included retaining control of Congress – he too had a regime to preserve. Kennedy's point of view was clear: the deployed Soviet strategic nuclear missiles were a threat to the United States and must be removed. He assumed that such a strategy could be developed. He apparently also assumed that the Soviets had placed a *small* force on the island. Possible outcomes included successful removal of the missiles and their

supporting forces, an escalation of measures to prompt that removal, and the possibility of conventional or nuclear war.[106]

Kennedy had evidence of his political vulnerability He also had evidence – Khrushchev's own actions included – that the Soviet leader was a formidable adversary. But based on Penkovsky's evidence he inferred that Khrushchev might be persuaded to back down. As Scott concludes, "various writers contend that Penkovsky's intelligence…[guided] Kennedy's handling of the crisis from a position of strength."[107] This occurred in part because "the KGB's discovery of Penkovsky's espionage alerted Khrushchev to the fact that Kennedy now knew he was bluffing."[108] As has been noted, Kennedy lacked accurate evidence about what was really on the island. Nevertheless as has been noted, he inferred that military strikes were not – at least at that time – an option. Kennedy probably relied on the same concepts on which Castro and Khrushchev relied. In addition, the concepts embodied in the Monroe Doctrine were also probably a factor. Kennedy's key question was, "How to get the Soviets and their missiles out of Cuba?"

Foresight. Viewed with foresight, there were a number of possible outcomes to the crisis based on the inferrable goals that could be associated with any of the three leaders. A win for one of the leaders was not necessarily a loss for the others as table 4 shows. In some cases, achieving one's goal was a win for the leader, but a failure to achieve it was *not* necessarily a loss. "Winning" the crisis should have involved attaining all or most of one's goals. However, since not all goals were of equal importance, failing to achieve one could mean that one lost in the larger crisis. Similarly, achieving one's goals did not guarantee winning the larger crisis. This becomes evident as the actual winners and losers are considered.

108 Scott, "Penkovsky," 32.

And the Winner is? Who actually won the Missile Crisis? Critical assessments of the three leaders involved and the attainment of their goals reveals the answers. First, Castro certainly got what he wanted: The United States never again invaded Cuba.

What did Khrushchev get out of the resolution of the crisis? From the standpoint of his first goal, to protect Cuba from the United States, he was successful. The subsequent removal of the Jupiter

Goal	Outcome	Leader		
		Castro	Khrushchev	Kennedy
Prevent U.S. Invasion of Cuba	Achieve	Win	Win	Neutral
	Fail	Lose	Lose	Win
Get the Missiles out of Cuba	Achieve	Neutral	Lose	Win
	Fail	Win	Win	Lose
Spread Communism	Achieve	Win	Win	Lose
	Fail	Neutral	Lose	Win
Get U.S. and Allies out of Berlin	Achieve	Neutral	Win	Lose
	Fail	Neutral	Lose	Win
Force Concessions from United States	Achieve	Win	Win	Lose
	Fail	Lose	Lose	Win
Force Concessions from Soviet Union	Achieve	Neutral	Lose	Win
	Fail	Neutral	Win	Lose
Force Concessions from Cuba	Achieve	Lose	Neutral	Win
	Fail	Win	Win	Neutral

missiles in Turkey appeared to increase the security of his borders – an apparent concession from the United States.[109] However, Khrushchev failed to spread Communism further. And Berlin remained partially

109 The issue of the Jupiter missiles is complex. They were not included in the formal agreement but were offered up in a secret unilateral assurance from Kennedy (Garthoff, *Reflections,* 132).

in the hands of the West. If, as Allison and Zelikow postulate, this was the real motivation behind the nuclear deployment then Khrushchev's failure was highly significant. Additionally, his regime was embarrassed by the revelation in the United Nations of the presence of the missiles. Ultimately, he was removed from power two years later and placed under house arrest until his death in 1971. So, Khrushchev, while he won a number of his goals, wound up the overall loser.

Kennedy is the other winner in the crisis. He gets the Soviets missiles removed from Cuba while avoiding war. He is later able to retire an obsolete missile system (the Jupiters). He prevents the Soviet Union from seizing control of Berlin. Finally, his popularity increases and the Democrats retained power in the 1962 elections.

Ten Years Later, They Meet Again

It is worth noting that Soviet denial and deception in support of military deployments and operations in Cuba did not end in the early winter of 1962. In 1970 Henry Kissinger stormed into the office of H. R. Haldeman and demanded to see President Nixon. Aerial reconnaissance had brought news. "The Cubans are building soccer fields," Kissinger said. "Cubans play *baseball*. *Russians* play soccer."[110] The Soviets it seems had been discovered building a submarine base at Cienfuegos. Prior to a particular overflight, that fact had been denied to the United States. The soccer fields were for the recreation of Soviet troops.

Judgment: Critical Thinking Would Have Made a Difference

As this case study makes clear, there are a number of junctures where critical thinking or structured analytic methods could have made a difference in analyzing the Soviet missile deployment to Cuba. While it is true that Sherman Kent argued for a scientific approach to analysis, it does not seem to have been widely practiced at the time.[111] As of 1962, most studies that we now have in hand on human reasoning in intelligence had not been completed. The champions of structured intelligence analysis methods had not yet developed their techniques.

Nevertheless, a study of the crisis is germane because the same kinds of errors *repeat themselves again and again.* The errors seen in the Cuban case – failure to question assumptions, to take seriously the evidence and the patterns they imply, to counterfactually examine analytic implication and consequences, in short to make reflective judgments – also were cited by the Senate in its critique of the 2002 Iraqi WMD estimate.[112] In both cases, deceptions confounded analysts, leading them to wrong conclusions.[113] In the Cuban case the analysts eventually figured it out. This did not occur in the

---

111 Sherman Kent, *Strategic Intelligence for American World Policy* (Princeton, PA: Princeton University Press, 1949), 151–208.

112 In the Cuban situation, the debate between McCone and analysts over the nature of the weapons the Soviets might emplace came close to overcoming these errors. Regarding the Iraqi WMD estimate, the debate between the CIA and the Department of Energy over the use of the aluminum tubes also came close. Unfortunately, the incipient debate focused on the results, not the process. In both cases, the side that was eventually proved right failed to make the now-accepted case.

113 Sherman Kent challenged this assertion in his defense of the original estimate and the process by which it was created. He believed that an earlier revelation of the Soviet actions would have led to an intractable situation. However, an earlier revelation – say in August – would have offered President Kennedy and his advisers more options, particularly more *diplomatic* options. Kent also failed to observe that denial and deception occurred – at least for the record. See Sherman Kent, "A Crucial Estimate Relived," Reprint, *Studies in Intelligence* 36, no. 5 (1992): 111–119.

most recent failure. Critical thinking skills went unused among both generations of analysts.

How Can Intelligence Analysts Employ Critical Thinking?

The Poor Record

Critical thinking is what consumers of intelligence appear to expect when they task producers to examine issues. Corporate consumers require analysts creating intelligence to "[evaluate] a situation, problem, or argument and [choose] a path of investigation that leads to finding the best possible answers."[114] In the national security field, strategic intelligence pioneer Washington Platt notes that "[intelligence] is a meaningful statement derived from information which has been selected, evaluated, interpreted, and finally expressed so that its significance to a current national policy problem is clear."[115] Derived from strategic intelligence, "best answers" should clearly express what is significant to national policy problems. They may also support warfighters with essential operational and tactical intelligence. Critical thinking leads to the best answers for the specific context at hand.

Unfortunately, analysts' biases and mindsets repeatedly obscure best questions and answers. From well before the Japanese surprise attack on Pearl Harbor to the 2002 estimate on Iraqi weapons of mass destruction, a failure to think critically about potential crises contributed to repeated intelligence failures.[116] "Expert analysis"

Chapter 1 provides a summary of U.S. intelligence failures during the first half of the 20th Century. While hindsight is an imperfect mirror for reviewing the past, one conclusion to be drawn from a review of the evidence is that critical thinking could have minimized many of the ensuing crises.

was not enough.[117] Biases and mindsets too often converted subject-matter confidence into arrogance; false assumptions blinded analysts to their target's true intentions. For example, at least one CIA Iraq analyst acknowledged that the 1990 invasion of Kuwait,

> was an intelligence failure…We were guilty of a kind of mindset…The idea that a country [Iraq] would march up to the border, put 100,000 troops there, go in and do what they've done; I don't think anybody thought they'd do it.[118]

In 2002, Intelligence Community analysts failed to definitively assess whether the Iraqi government still possessed weapons of mass destruction. The Senate noted in its review of the failure that

> [rather] than thinking imaginatively, and considering seemingly unlikely and unpopular possibilities, the Intelligence Community instead found itself wedded to a set of assumptions about Iraq, focusing on intelligence reporting that appeared to confirm those assumptions.[119]

The mistakes of 2002 also occurred in 1990 – and for that matter in 1941. Analysts failed to question assumptions widely held at the time. Instead they chose the first answer that satisfied the situation, a phenomenon known as "satisficing."[120] Other means by which intelligence analysts and policymaking customers reasoned poorly are listed in table 5. According to Ephraim Kam, the problem is so great that the intelligence analysis process is "consistently biased, and…bias

is the cornerstone of intelligence failures."[121] Paul and Elder claim that much thinking is "biased, distorted, partial, uninformed, or down-right [sic] prejudiced."[122] There are repeated failures to think critically; but could critical thinking about these situations prevent the failures?

Means by Which Decisions are Made
Select first answer that appears "good enough."
Focus on narrow range of alternatives, ignoring need for dramatic change from existing position.
Opt for answer that elicits the greatest agreement and support.
Choose the answer that appears most likely to avoid some previous error or duplicate a previous success.
Rely on a set of principles that distinguish "good" alternatives from "bad" alternatives.

Table 5: How Analysts Decide

Source: Excerpted from Alexander George, *Presidential Decisionmaking in Foreign Policy: The Effective Use of Information and Advice* (Boulder, CO: Westview Press, 1980), Chapter 2.

Critical thinking helps mitigate the effects of mindsets and biases by invoking skillful examination of evidence both for and against an issue, as well as consideration of obvious and less obvious alternative explanations. In the 1990 example, thinking critically would have raised other possible explanations for why Hussein's troops were on the Kuwaiti border and what he intended for them to do.[123] That the Iraqi troops were trained by the former Soviet Union and followed its tactics might have been an indicator of future intentions. In the case of the weapons of mass destruction (WMD), analysts might have

121 Ephraim Kam, Surprise Attack: The Victim's Perspective (Cambridge, MA: Harvard University Press, 1990), 85.

122 Paul and Elder, *Concepts and Tools,* 1.

123 A consideration of who trained Hussein's troops – in this case, the Soviet Union – might have led to an examination of military doctrine. Thus, it quickly would have become clear that troops mobilized on a border were going to cross that border. Analysts would then have known that an invasion of Kuwait was imminent.

asked, as they realized they had no new evidence of the weapons, "How can we prove that the weapons of mass destruction definitely are not there?" or "What would we expect to see if Saddam Hussein had gotten rid of his weapons of mass destruction?"[124]

We must assume that analysts can be encouraged to think in this manner. Modern strategic intelligence pioneer Sherman Kent believed this to be the case when he wrote nearly 60 years ago that intelligence analysts "are supposed to have had more training in the techniques of guarding against their own intellectual frailties" than the larger populace.[125]

Assessing Evidence[126]

Understanding how evidence is assessed is a necessary first step in understanding how analysts can better reason with and about it. The incomplete and ambiguous information and data with which intelligence professionals work compounds their reasoning process.[127] Sources are unreliable and contradictory; adversarial denial and deception increase doubt. When information and data are questionable, derived evidence is even more uncertain, and inferences arising from that evidence may be highly suspect. One way that analysts can reduce this uncertainty is by building defensible inferences

---

124 These analyses are those of the author. The last question was jointly arrived at in a conversation between the author and Mark Lowenthal, 26 July 2005.

125 Sherman Kent, *Strategic Intelligence for American World Policy* (Princeton, NJ: Princeton University Press, 1949), 199.

126 This section is based (with additions) on materials developed by Francis J. Hughes and the author for a structured analytic methods course taught at the National Defense Intelligence College. For a deeper examination of evidence assessment see Francis J. Hughes and David A. Schum, *Credibility Assessment: A First Step in Intelligence Analysis,* unpublished tutorial, National Defense Intelligence College, April 2003.

127 Information, data, and evidence are different kinds of knowledge. Pieces of information comprise data, which in turn comprise evidence. Evidence is further distinguished from data by the fact that it contributes to discrimination among alternative end states. Data, while relevant, do not necessarily allow discrimination.

TESTIMONIAL: APPLYING CRITICAL THINKING

This is a true story. All the characters are real and really naive.

As a fresh graduate of NSA's critical thinking and structured analysis class, I attended an Intelligence Community class on counterintelligence. My fellow students included folks from all over the community, including CIA and FBI case officers. During the class, the instructor put forth a case study for students to think about and decide how best to "analyze and investigate" to find the mole. Differing opinions surfaced, but a common thread appeared among the case officers: follow your "gut" feeling and collect evidence to support that assumption, no matter how long it took.

The instructor, enjoying the collective mindset and the opportunity to shatter paradigms, concentrated on how information was collected and analyzed. Again, the case officers agreed the best solution was to continue gathering information until you "proved your case." I, the lone NSA token student, raised my objection, "How long is long enough? Until you've ruined the career of innocent, hardworking persons in the IC, or until you find another answer you like?" Although it did not earn me friends, it did open up a window to inform these case officers and other attendees about the intricacies of analysis.

Critical thinking is not just about putting information together, finding a pattern, then choosing an answer, it is about reducing bias, considering all options available, and presenting options to a decision–maker. And critical thinking is about paying attention to what and how you are doing it. I reasoned that, since the investigators in the case study concentrated on only one

Source: A mid–level intelligence professional at the National Security Agency

from the evidence. At their most basic level, these inferences depend on credibility (can it be believed), relevance (does the evidence bear on the issue), and inferential or probative force (how compelling is it in answering the questions raised by the issue). Unfortunately, no mass or body of evidence – in intelligence or anywhere else – comes with these three properties already established. Establishment of these properties to abet uncertainty reduction through inference occurs only through a process of argument, creative hypothesis generation, and the development of chains of reasoning.

Authenticity, accuracy, and reliability represent criteria for establishing the credibility of tangible evidence.[128] An analyst striving

128 "Tangible evidence" is a technical term describing *things* that bear relevance to an issue under scrutiny. It is contrasted with "testimonial evidence"

person, the analysis was faulty because somewhere along the line they limited their suspects (introduced bias) regardless of reason (access, family connections, angel–like qualities, etc.). Although it would take time, the investigators should conduct quantitative and qualitative analysis, make a decision tree (options open to a mole in a heavy security environment), and then play Devil's Advocate. In addition, analysis never reveals one "solution" or "smoking gun"; it leads to two or three "options" which can be investigated in detail.

The instructor, pleased that someone in the class knew what the "Analysis of Competing Hypotheses" was, revealed the answers of the real–life case study: after three years of investigating, the case officers had the wrong person due to incorrect information in old reports and limiting their suspect list. Instead of going back to the original source information, the officers read old reports that were unfortunately biased by Agency politics and external societal events (1950–60s). The real mole was discovered over a decade later; he was the son of a former Agency chief, well educated and well liked, but did not have access to the information. The individual "borrowed" interesting reports from friends who had access, covered his tracks, and continued spying against the U.S. for several years. Just as the authorities were about to arrest him, he was found dead in a hotel room from a reported suicide, but the cops could not figure out how he had two bullets in his chest and one in the back of his head. Miracle suicide.

What is the moral of the story? Conduct a thorough analysis right the first time and you can catch a mole anytime. I only hope the attending case officers got the message, especially from a non–gun toting NSA analyst.

who wishes to remain anonymous, email to the author, 9 March 2006.

to determine authenticity may ask, "Is the evidence what it seems to be?" In determining accuracy, the key question is whether the piece of evidence or the system that produced it has the resolution to reveal what the analyst believes the event or record should reveal. Assessing reliability involves determining whether different means of collection produce the same results.

If, on the other hand, the evidence is testimonial, different criteria apply. The first thing to be established is whether the source is being truthful. Truthfulness is not absolute. Rather, it is time- and context-dependent. A source may believe he is being truthful about an issue or may have legitimate reasons to be untruthful about that issue. In

– what people say about the issue.

another time and about another issue, these impediments to veracity may not exist for that source. Therefore, establishing the truthfulness of a source can pose a significant challenge to the analyst.

In an ideal situation, a review of evidentiary relevance causes an analyst to examine the likelihood of any potential answer to the problem or question – a hypothesis – with an eye to the modification of existing hypotheses or even the invention of new ones. In other words, an analyst might theorize that a certain bit of evidence will indicate that an individual or a group of individuals will engage in nefarious activity. Yet, if none of the evidence at hand bears on the issue, then the analyst may need to reconsider – or even reject – this evidence based on its lack of relevance. The analyst also should consider that the individual *may not* engage in the activity.

What is true about the future is also true about the present and the past. A lack of evidence relevant to an issue should prompt analysts to reassess their theories about the issue at hand. For example, an unnamed FBI investigator in the 2001 anthrax case noted, "[Reasoning] says that if you think a person is your guy, but you can't find anything to put him in the game, you've got to keep looking at others."[129] The failure of the FBI to implicate its principal suspect forced it to consider other explanations as to who sent the anthrax-laden letters in September 2001 to political leaders and media figures.

The analyst also is concerned with how strongly the evidence

129 Allan Lengel and Guy Gugliotta, "Md. Pond Produces No Anthrax Microbes: FBI Sought Clues In Deadly Attacks," *Washington Post*, 1 August 2003, A03. Cited hereafter as *Washington Post,* "No Anthrax." While this is a law-enforcement example, it illustrates good critical questioning about an apparent lack of evidence. Criminal investigation and intelligence analysis similarly assess events and evidence with the goal of description, explanation, and interpretation. The principal difference is that intelligence analysis endeavors to do so *before* the event occurs – in other words, *to estimate.* It is worth noting that over two years after the pond was drained the case remains unsolved; the individual under suspicion at the time was never charged with the crime. The FBI was unable to link the evidence to the individual. See for example, Allan Lengel, "Little Progress In FBI Probe of Anthrax Attacks: Internal Report Compiled As Agents Hope for a Break," *Washington Post,* 16 September 2005, A01.

undermines or supports the particular hypotheses under examination – the probative force of the evidence. Certain evidence, coming from certain kinds of sources, persuades more strongly than does other evidence drawn from other sources. Tangible evidence might have greater probative force than testimonial evidence. Consider, for example, a hypothetical biological weapons issue. Traces of certain toxic substances found near an alleged biological weapons lab carry greater probative force than the testimonial denials of the government of the country in which the lab and the samples were found.

The "ideal" analyst also assesses the objectivity, observational sensitivity, and competence of sources. One question suitable for this assessment is how biases may have corrupted a source's objectivity. Did the source see or hear the evidence directly, and under what conditions did this occur? A reality check also is made at this point. Does it makes sense that a particular source claims to have been in a position to make the observation or have access to the source of information?

Another consideration involves denial and deception. In assessing the evidence, the analyst should ask, "What is the likelihood that I am being deceived? This question is surprisingly difficult to answer accurately. Given that anchoring biases and confirmation heuristics cause analysts to find what they seek to find, a denial and deception hypothesis is often easily proved.[130] Critical thinking challenges this by forcing an examination of alternative points of view. For intelligence analysts, proactive, focused and surreptitious collection of information about the often minimal disconfirming evidence pays rich dividends.[131] In this case, the question becomes, "What is the likelihood that I am *not* being deceived?" Thus engaged, really good intelligence analysts create valuable knowledge.

Facilitating Evidentiary Assessment

The questions that need to be asked about each piece of evidence are the same as those employed in critical thinking. In making her evaluation of what constitutes evidence, the analyst repeatedly asks "why": "Why do I believe this information is relevant to the question at hand (either against or for) and therefore exists as evidence?" "Why do I believe the source to be credible?" Additional questions about the analyst's own thinking processes might arise, such as: "What are my biases and why do they lead me to think this way?"

For example, in assessing the intentions of former Iraqi dictator Saddam Hussein in light of the U.S. destruction of his intelligence headquarters in 1993, an analyst might ask whether Hussein's declarations not to retaliate against the United States were credible. A corollary question might be, "What does Saddam Hussein gain by denial and deception?" Based on Hussein's statement, a determination that additional evidence was needed would stimulate collection of similar statements from other episodes. By analyzing what Hussein did in those instances, the analyst might determine that he was usually untruthful. Therefore, this piece of evidence would be deemed to be of low credibility despite its probative force, and relevance to the determination whether Hussein would or would not retaliate.[132] In other words, Hussein's statement might reflect an ongoing deception campaign. To explore this hypothesis further, the analyst might seek to determine whether increases in Iraqi agent communications were relevant to the issue and whether additional collection of such broadcasts was warranted.[133]

In practice, these and similar questions can be answered quickly. Analysts often answer some of them unconsciously as they struggle

132 Heuer develops this scenario and evidence in an example of the analysis of competing hypotheses. See Heuer, *Psychology*, 101–102.

133 Heuer, *Psychology,* 101–102. For a recent detailed look at Saddam Hussein and deception see Kevin Woods, James Lacey, and Williamson Murray, "Saddam's Delusions: The View from the Inside," *Foreign Affairs* 85, no. 3 (May/June 2006). URL: <http://www.foreignaffairs.org/20060501faessay85301/kevin-woods-james-lacey-williamson-murray/sadda-s-delusions-the-view-from-the-inside.html>, last accessed 31 March 2006.

to meet short deadlines. However, as a function of not employing scientific methods or other structured and critical thinking techniques, their thinking is largely intuitive. Analysts choose to ignore how mindsets and assumptions impede their judgments. Conversely, critical thinking ensures that the reasoning process is a self-conscious one. By making the unconscious conscious, analysts reveal where they may be biased, helping ensure that questions they address are thoroughly and fairly considered.

Each method of analysis uniquely interacts with the intelligence question; therefore, the method (or methods) selected can produce profoundly different results – affecting the analyst's arrival at the most accurate answer.

An analyst committed to critical thinking continually asks questions while developing the mass of evidence needed to assess an issue. Evidence arises from questions answered satisfactorily. Information for which the questions cannot satisfactorily be answered is excluded – but only after the analyst reflects on the process of evidence development. Consideration is owed to the question of how biases, and possibly active denial and deception by an adversary, have influenced the selection of both questions and answers. One way of revealing bias is by asking questions such as, "If the opposite outcome is actually true, what other evidence would I expect to see?"

The marshaling of evidence refers to a questioning process by which data and information are assessed and evidence is created. It may be done in solitary fashion, Socratically with a teammate, or collegially among Intelligence Community focus groups. It is a vital ingredient of productively imaginative intelligence analysis. Each question an analyst asks not only becomes a device for attracting existing evidence, but also generates new evidence not yet visible. Identifying new evidence increases the thoroughness by which the issue is evaluated and increases the probability that the correct solution has been discovered.

Embracing a Methodology

Once a relevant mass of evidence is established, the analyst evaluates which method or methods of analysis may best develop

a solution to the issue. Differences among various analytic methodologies, techniques, and tools are not trivial.

In fact, comparing the results of different analysis methods can be a valid means of establishing the accuracy of the answer. If various means of analysis yield multiple results, a review by different analysts makes for the ideal environment for critical thinking to discuss and debate those results.[134]

Therefore, assessment of the available evidence includes redirecting thinking, soliciting feedback from other sources, appraising the quality of possible answers, and comparing initial goals with results. In so doing an analyst employs interpretive and evaluative skills to select the best mass of evidence to analyze.

Creating Better Inferences

Critical thinking aims to ensure that inferences are reasonable and evidence-based. Inference creation begins at the same time that analysis starts. As each piece, or the whole mass of evidence, is considered, inferences are made.[135] Resulting "chains" of inferences linking the evidence to the hypotheses under consideration are known as arguments. Chains of inferences converge – strengthening the argument – or diverge – weakening it. The self-reflective nature of critical thinking places a check on these inferences. The analyst asks, "Do my inferences flow from the evidence?" and, "Are my inferences logical given the evidence and other inferences I have made?"

Inferences lead to a search for additional evidence. In other words, based on inferences drawn from the evidence at hand, an analyst may infer that there are other sources of evidence to consider. For example, such reasoning was cited in the explanation of why

134 For a more detailed discussion of this and other means of countering biases, see Heuer, *Psychology*, 170–184; Irving Janis, *Groupthink: Psychological Studies of Policy Decisions and Fiascoes*, 2nd Edition (Boston, MA: Houghton Mifflin Company, 1982); and Scott Plous, *The Psychology of Judgment and Decision-making* (New York, NY: McGraw Hill, Inc., 1993).

135 Indeed, the analyst's acceptance – or rejection – of this evidence is a result of inferences: either the evidence is valid, credible, and relevant, or it is not.

the FBI investigated a pond in western Maryland during June 2003, searching for the source of the 2001 anthrax attacks. At the time, the FBI believed their primary suspect lived near the pond in question. In their search for additional evidence, they reasoned that the pond might be something in which evidence had been hidden. Thus, inference led the FBI to drain the pond to search for that evidence.[136]

The analyst self-consciously evaluates the thinking process and the biases that have affected it to reduce unproductive thinking and to consciously develop new ways of understanding the evidence at hand. This self-regulation also plays a role as the available evidence is considered. A means of accomplishing this within a collaborative setting is to seek the assistance of colleagues of diverse backgrounds. The underlying premise is that their biases differ sufficiently to enable productive and thorough analysis to occur.[137]

Producing Intelligence

Analysts who produce intelligence assessments and judgments have the opportunity to employ what Peter Facione considers the core cognitive skills of critical thinking: interpretation, analysis, evaluation, inference, explanation, and self-regulation.[138] Each of these competencies contributes to the integration of available evidence through a clear line of reasoning to the most probable answer.

Facione asserts that good critical thinkers can explain "what they think and how they arrived at that judgment."[139] By documenting the

139 Facione, *Critical Thinking,* 5.

reasoning process used to arrive at an answer, analysts move beyond merely "stating results [to] justifying procedures, and presenting arguments."[140] Questioning biases and mindsets encourages consideration of alternative possibilities that overcome what Josh Kerbel refers to as "single–outcome [analytic] trajectories."[141] Most importantly, analysts demonstrate a critical spirit – a reflection of character.[142]

Thus, critical thinking contributes to short-term analysis and assumes an essential role in longer-term analysis. Indeed, building a comprehensive picture of an issue or target requires critical thinking to determine which previous reports are included or excluded. "How do the parts contribute to the whole?" is one question the analyst asks. Another is, "How is the whole greater than the sum of its parts?" When previously published intelligence reports diverge, the critical thinking process helps the analyst ensure that the divergence is considered fairly and that the resulting intelligence does not merely satisfice.

How can Analysts be Taught to Think Critically?

Many people would rather die than think – in fact, they do.

—Bertrand Russell

Critical Thinking Education Outside the Intelligence Community

Critical thinking offers a framework for structured problem solving. Yet, despite a corpus of associated literature, critical thinking remains in its infancy as a discipline. It is still "largely misunderstood…existing more in stereotype than in substance, more in image than in reality."[143] As Bertrand Russell's humorous quip reminds us, critical thinking is not a habit acquired by just being alive.

Ideally, valuable skills and dispositions should be developed among prospective analysts before they join intelligence-producing corporations. Yet, observations by the author of newly hired intelligence analysts suggest this happens rarely if at all. This raises two questions, "What are the opportunities for prospective analysts to become critical thinkers before they are hired?" and often "Why do these opportunities not exist?"

Despite its importance, critical thinking is not widely taught in schools and universities. A mid-1990s California study on the role of critical thinking in the curricula of 38 public and 28 private universities concluded that the skill is "clearly an honorific phrase in the minds of most educators."[144] The study concluded that university

143 Richard W. Paul, "A Draft Statement of Principles," The National Council for Excellence in Critical Thinking, URL: <www.criticalthinking.org/ncect.html>, last accessed March 18, 2003. The reasons why critical thinking remains an undeveloped discipline while important, go beyond the scope of this essay and are not addressed.

144 Richard W. Paul, Linda Elder, and Ted Bartell, "Executive Summary,

faculty members "feel obliged to claim both familiarity with it and commitment to it in their teaching, despite the fact that…most have only a vague understanding of what it is and what is involved in bringing it successfully into instruction."[145] Indeed, the authors of the study found that while 89% of the faculty they interviewed "claimed critical thinking was the primary objective of their instruction," only 19% could define the term and only 9% were evidently using it on a daily basis in their instruction.[146] If the results of the California study are representative of the nation at large, they explain why prospective new hires – themselves college graduates – generally fail to exhibit skill in critical thinking at any level of proficiency.[147]

Informal conversations with recent hires at NSA support this premise. Although slightly fewer than half of these individuals indicate they have been exposed to critical thinking skills in college, most have been exposed only in one class and then only as an approach to learning the materials covered in that class. While not discouraged, respondents apparently were not encouraged to apply the skills to other subjects. Thus, a disposition to think critically is rarely fostered. Further, when asked to define critical thinking, most

Study of 38 Public Universities and 28 Private Universities To Determine Faculty Emphasis on Critical Thinking In Instruction," *California Teacher Preparation for Instruction in Critical Thinking: Research Findings and Policy Recommendations,* California Commission on Teacher Credentialing, Sacramento California, 1997 (Dillon, CA: Foundation for Critical Thinking, 1997), URL: <criticalthinking.org/schoolstudy.htm>, last accessed March 18, 2003. Paul, Linda Elder, and Ted Bartell, *California Teacher Preparation for Instruction in Critical Thinking: Research Findings and Policy Recommendations California Commission on Teacher Credentialing,* Sacramento California, 1997 (Dillon, CA: Foundation for Critical Thinking, 1997), 18.

147 A recent but unscientific survey of several major eastern American universities' online catalogs shows the term "critical thinking" to be used widely in course descriptions. Further examination of some of those courses suggests that East Coast academics may share a similar lack of understanding about critical thinking. Although beyond the purview of this paper, it appears that there is sufficient evidence to warrant repeating the California survey on a national basis.

young analysts were unable to do so in any comprehensive fashion.[148] Finally, few employ any form of critical thinking in their analytic (or other) reasoning unless they have been trained to do so.

In fairness, it should be noted that critical thinking awareness, attitude, and skills varies from one academic discipline to another. For example, students of the physical sciences who employ the scientific method in a community setting probably have a greater inclination toward a basic form of critical thinking if only through osmosis.[149]

There are also some primary, secondary, and university education programs that have adopted a meta-cognitive critical thinking paradigm. Although the results of the impact of such programs are largely anecdotal, at least one study, conducted by Jennifer Reed as part of her dissertation found that students' critical thinking skills improved *after just one course.*[150] Faculty and administrators of these programs routinely attend the annual critical thinking conference sponsored by the Center for Critical Thinking where their results are shared. However, the approximately 500 people who attend this international event represent a small fraction of the educators in the United States.

The elements of scientific method – the formulation of hypotheses, collection of relevant data, testing and evaluation of hypotheses, and the logical derivation of conclusions – are matched step-by-step by

148 These conversations occur routinely as part of a training course the author teaches to newly hired intelligence and language analysts at NSA. When asked to complete the following statement, "In my opinion, critical thinking involves…" typical answers center on "thinking outside the box."

149 Francis J. Hughes, conversation with the author, Washington, DC: National Defense Intelligence College, 8 May 2003. Mr. Hughes is one of the few proponents and teachers of evidence-based inferential intelligence analysis, a means of analysis requiring critical thinking at every stage in the process.

Reed, *Effect of a Model For Critical Thinking on Student Achievement In Primary Source Document Analysis And Interpretation, Argumentative Reasoning, Critical Thinking Dispositions, And History Content in a Community College History Course,* PhD Dissertation, College of Education, University of South Florida, December 1998, vii. URL: <http://www.criticalthinking.org/resources/JReed-Dissertation.pdf>, last accessed 6 May 2006.

critical thinking.[151] Given that most newly hired intelligence analysts – at least at NSA – are drawn from fields other than the physical sciences, one can expect that new hires lack adequate critical thinking skills. If NSA's newly hired intelligence analysts are representative of those being hired across the Intelligence Community then it is probable that few of the thousands of new hires arrive with adequate critical thinking skills.

Critical Thinking Education Inside the Intelligence Community

That analysts need to develop critical thinking skills is recognized within the Intelligence Community. Heuer wrote in 1999, "[Traditionally], analysts at all levels devote little attention to improving how they think."[152] As a direct response to Heuer's criticism, the CIA's Sherman Kent School includes critical thinking as part of the curricula for training new analysts, and recently initiated a class in critical thinking.[153] New employees are encouraged to develop a disposition to think critically as they are taught the skills of intelligence analysis.

A similar approach is employed in courses on structured analysis methods at the National Defense Intelligence College (NDIC). Critical thinking is claimed as a feature of many NDIC courses. However, the emphasis in most courses is on topical or issue-related material, and only incidentally on the process of thinking. At present, the skill itself is largely not taught. Instead, students are expected to figure

Marrin, "CIA's Kent School: Improving Training for New Analysts," *International Journal of Intelligence and Counter Intelligence* 16, no. 4 (Winter 2003–2004): 609–637.

it out on their own, encouraged by the thesis writing process. The college is aware of the importance of critical thinking and new core courses may include formal critical thinking instruction.

New NSA analysts are provided with an introduction to the solitary part of the skill (as discussed in figure 4) as part of their orientation. The agency's 40-hour follow-on program is the first Intelligence Community course to focus primarily on enhancing analysts' solitary and communal critical thinking skills. In addition to critical thinking skills, participants learn and apply, and then assess, the appropriateness of fourteen structured methods of analysis. The course has been taught to both U.S. and Allied personnel drawn from intelligence, counterintelligence, information assurance, and law enforcement communities.[154]

Training in critical thinking is offered to Defense Intelligence Agency (DIA) analysts using a variation of the NSA-developed course. Also, in 2005, DIA tested the "critical thinking skills" of a sample of its employees using the *Watson-Glaser Critical Thinking Appraisal*. The instrument claims to "measure abilities involved in critical thinking, including the abilities to define problems, select important information for the solution to problems, recognize stated and unstated assumption, formulate and select relevant and promising hypotheses, [and] draw valid conclusions and judge the validity of inferences."[155] The appraisal appears to confuse abilities with skills, although both do belong within the domain of analysis.[156] Finally, it appears that the test does not evaluate an individual's meta-cognitive skills in assessing and correcting the *process* of reasoning.

The increasing opportunities for enhancing critical thinking skills and dispositions reflect a recognition of the importance of critical

156 Abilities and skills are easily differentiated. Individuals are born with certain abilities (and can improve them through training) but they *must* learn a skill. See for example, Moore and Krizan, "NSA."

thinking in intelligence analysis.[157] Evidence becomes intelligence through an "ordered thinking process [involving] careful judgments or judicious evaluations leading to defensible conclusions" – through critical thinking.[158] Former CIA analyst Morgan Jones asserts that methods for critical thinking and problem solving, if applied, can improve the quality of analysis and decisionmaking.[159]

Implications of Teaching Critical Thinking

Although Sherman Kent, Richards J. Heuer, Jr., and others have over the years addressed intelligence analysis and its relationship with critical thinking, recent presidential executive orders and legislative mandates are bringing a new emphasis to how the Intelligence Community can change analytic practices to achieve improved outcomes. Teaching analysts to be better critical thinkers may be seen as an easy way to satisfy these requirements. However, linkages between intelligence analysis and critical thinking remain poorly understood. Considerable confusion remains about what constitutes critical thinking and how it supports intelligence analysis.

A common excuse among analysts to defend their "non-use of such self-conscious processes is a lack of time."[160] Teaching critical thinking skills is of little value if analysts are not inclined to use them.[161] For those who are willing to think critically, various

157 The Director of National Intelligence, John D. Negroponte, in the Foreword of the initial *National Intelligence Strategy of the United States of America* (Washington, DC: Office of the DNI, October 2005), wrote that one of the three principal tasks for the reformed Intelligence Community is to "bring more depth and accuracy to intelligence analysis." See http://www.dni.gov/NISOctober2005.pdf.

160 Stephen Marrin, email to the author, December 8, 2003. The author has heard similar complaints from analysts at NSA and DIA.

161 Linda Elder, Alec Fisher, Diane Halpern, Gerald Nosich, Richard Paul, and others develop and publish the materials for – as well as teach – such courses.

instructional models offer complementary means of expanding and enhancing analysts' skills. For example, in an area studies class on Russia, students might be asked to evaluate and comment in depth on what different sources say about the influence of organized crime on the national government. Alternatively, critical thinking can be injected into the course as part of a problem-solving curriculum. Here students focus on *how* they think as they apply different strategies to each assignment, and then, ideally, transfer those enhanced skills to their day-to-day analysis. The use of realistic case studies makes classroom-acquired knowledge actionable. Self-reflective and group-reflective analyses of the process of reasoning keep the classes focused toward the working environment of analysts.

Such transformations involve behavior modification and as such take time. Participants engaged in such instruction cannot be expected to become critical thinkers in a one-day or even a week-long course. The instructors of the NSA course attempt over a period of 10 weeks to transform their students into critical thinkers. Some other Community efforts also provide instruction over an extended period. Even so, students leaving the course are still novices in this practice and can slip back to their old methods of reasoning. Becoming critical thinkers requires a change in behavior that extends long past the end of the formal instruction. There is no substitute for continued practice.

Finally, it serves critically thinking analysts poorly if their management and corporations are indisposed toward the application of the skills. It is well known that "engendering the desire to use [critical thinking] as a favored means of problem solving and decision making prepares the ground for teaching and learning the [critical thinking] skills."[162] Such encouragement can occur in the classroom but its effectiveness is limited unless the corporation encourages and welcomes strategies to employ critical thinking in the workplace.

However, there are few metrics for determining the effectiveness of these materials and courses and so their value remains undetermined. The fact that the books developed for, and used in, such courses remain in print (in successive editions) is an indicator that at least this approach is popular, if not effective.

162 Facione, "Disposition."

The best place for such encouragement is from senior and midlevel management. In order for this to occur, they too must be educated in the methods of, and reasons for, critical thinking.

Evaluating Teaching Models

Removing analysts from their work for education and training disrupts their primary mission of intelligence production. Spreading instruction over time provides a reasonable answer to this dilemma. Since improving critical thinking requires a high level of experiential, hands-on practice, an extended course offers students time to practice and apply what they are learning. This is the model used for the NSA course on critical thinking. Feedback from students indicates that once-a-week instruction works best. Mission is minimally disrupted and there is time to study and practice what is being taught. However, the long duration limits students' work-related travel and leave.

Experiential learning also requires that such classes be relatively small and that instructors be proficient. Without a large teaching staff, training a large workforce takes years. Since senior managers – and their strategic visions – change often, a long-term corporate commitment is crucial to success.[163]

Such a long-term commitment exists at the Sherman Kent School for Intelligence Analysis. The school itself grew out of a month-long course on analytic tradecraft developed by former Deputy Director for Intelligence Douglas J. MacEachin.[164] Beginning in 1996, the course was delivered to the entire analytic workforce. The school itself was established in 2000 and continues to evolve as both a training center and a center of best analytic practices.[165]

---

163 Alternately, a large staff can be created, trained, and assigned to teach an entire workforce. This was accomplished in a knowledge domain at NSA in the 1990s. If inducements and cultural change accompanied such a program, this approach might present certain advantages even if its costs are high. An analytic workforce could be transformed rapidly through such a "boot camp" approach.

164 Marrin, "Kent School," 615.

165 Marrin, "Kent School," 609.

Another means of critical thinking instruction is to create an interactive, computer-based or web-based course. This has the benefit of allowing as many analysts to attend as wish to do so. One or two instructors working full-time can answer students' questions. Exercises allow student self-assessment. However, this is presently an unsatisfactory model for critical thinking instruction. Learning to think critically requires Socratic interaction and the impersonal nature of web-based instruction discourages the practice even for the population of dedicated solitary learners. In the future, multi-player simulations and other games could be used to reinforce the lessons learned. However, these are not yet available.

Although computer- and web-based instruction can be accomplished at the analyst's desk, there are other reasons why this may not be a good idea. Analysts who remain in their offices are subject to interruptions. Further, course work is often relegated to the end of the workday, when analysts are tired and learning is impaired. Little learning occurs when taking a class is a chore. The current limitations of both classroom and computer- or web-based education suggest that experimentation with new means of instruction for critical thinking is needed.

Encouraging Analysts to Think Critically

Incorporating critical thinking into both orientation and basic analyst education and training is one way to help newly hired analysts develop their skills. Subsequently placing those analysts in offices where critical thinking is practiced is another way to encourage an analytic culture that fosters thinking critically. Through direct exposure to successful, experienced analysts, junior analysts' doubts about the employment of critical thinking techniques can be overcome.

"Skills pay" can be an inducement for analysts to learn and then employ critical thinking. Rewarding the acquisition, maintenance, and use of other special skills is common in government and industry. For example, linguists at NSA earn significant bonuses for achieving specific levels of foreign-language proficiency – an effective way

to maintain critical language competencies within one intelligence agency's workforce. Given the high-level concern for the health of the intelligence analysis process, direct monetary incentives should be available for analysts to master new tools and demonstrate constructive analytical behaviors.

On the other hand, if an intelligence enterprise fails to recognize and reward the acquisition and application of analytic skills such as critical thinking, it sends a very clear message: the enterprise does not value those skills. Faced with such a message and a lack of inducements to excel, the best and brightest analysts may leave, especially from the more junior ranks – and midlevel employees with families and mortgages may "retire in place." Either outcome hurts mission-critical functions, and can be avoided. As a previous Director of NSA, Air Force Lieutenant General Kenneth A. Minihan, noted, "If we don't win the talent war, it doesn't matter what we invest in the infrastructure."[166] Recognizing and rewarding critical thinkers is one way to win that talent war – with the assumption that really good analysts are more likely to remain active within their intelligence agency workforces.

If an analyst adopts a congeries of skills that contributes to the mastery of critical thinking, and is compensated monetarily, that mastery needs to be certified. If a curriculum that drives the acquisition of those skills is in place, then an assessment of those skills can be administered in-house. Specific tests exist for the assessment of critical thinking, such as the "Thinking Skills Assessment Test."[167]

Persuading to Improve Analysis

Teaching critical thinking is but a first step toward improving analysis. Because analysts and managers have different needs and

166 LtGen Kenneth A. Minihan, USAF, Director, NSA, in Robert K. Ackerman, "Security Agency Transitions from Backer to Participant," *Signal* 53, no. 2 (October 1998), 23.

167 For more information, see http://tsa.ucles.org.uk/index.html, last accessed 15 March 2006.

time constraints, multiple versions of a course are needed to meet the needs of each group. Analysts and first-line supervisors may take an entire course, midlevel managers an abbreviated course, and senior managers an overview. This strategy already is employed at the CIA's Sherman Kent School where new employees spend 13 weeks learning analysis skills, techniques, and methods while supervisors, depending on their seniority, spend three days or one day becoming familiar with these same skills and methods. The analysts also have opportunities to apply new skills immediately as they perform four-week "internships" in various CIA offices.

Other CIA analysts, already in place, do not have the same opportunities to receive this training. Thus a two-tiered analyst population with more skilled junior analysts and more knowledgeable senior analysts is being created. Ideally, each will transfer skills and knowledge to the others. However, an alternate possibility is that it will generate distrust and animosity between the two groups. Older, more experienced analysts may resent the opportunities given to their newer counterparts. This issue is not trivial. Offering the wrong curriculum to the wrong groups of analysts and managers can destroy its effectiveness. Managers in the CIA and elsewhere can influence how the new analytic methods being taught will be adopted, as agencies respond to new legislative and executive mandates.

Will analysts embrace critical thinking as a means to improve their analysis? There are numerous observations of analysts' reluctance to adopt new paradigms.[168] This is true even when analysts are confronted with the fact that their conclusions were wrong. In referring to her work on the issue of Iraqi WMD, one CIA analyst told Senate investigators, "their 'bottom line' judgments would have remained the same."[169] Rob Johnston also found a similar reluctance to change opinions among the analysts he studied. He noted that

168 Stephen Marrin, "Homeland Security and the Analysis of Foreign Intelligence," Markle Foundation Task Force on National Security in the Information Age, 15 July 2002, URL: <www.markletaskforce.org /documents/ marrin_071502.pdf>, last accessed December 9, 2003, 9. Cited hereafter as Marrin, "Homeland Security."

169 SSCI, *Iraq,* 299.

although "analysts can change an opinion based on new information or by revisiting old information with a new hypothesis," they perceive a loss of trust and respect and a subsequent loss of "social capital, or power, within [their] group."[170]

Yet, a case can be made that analysts, and especially experienced analysts, will benefit the most from enhanced critical thinking skills training. These are the analysts who are in positions of technical leadership, who work the most difficult aspects of complex targets. There may be significant consequences if they fail to notice and make sense of an issue. On the other hand, the fact that many of these senior personnel will soon be eligible for retirement raises an important question: Does the corporation get added value from teaching analysts who will soon retire to think more critically in their analysis if they are predisposed not to do so? Maybe so. Heuer, while the head of CIA's Methods and Forecasting Division found that analysts, once persuaded to use new analytic methods, found them "interesting and well worth doing."[171]

Other intelligence analysts have adopted new analytic methods that add value to their analyses. In one example, NSA personnel involved in research and development adopted a means of matching target characteristics and their vulnerabilities with exploitation capabilities and their costs.[172] Such analyses helped ensure that appropriate resources were dedicated to collection and that such collection was better tailored to production analysts' needs. However, some research analysts initially refused to employ the model, claiming it took too much time even as it reduced the volumes of information

172 In this context, a "target" refers to an entity – geographical, individual, or topical – in which the Intelligence Community has an interest.

they were required to examine.[173] Adoption of the analytic paradigm required appropriate persuasion.

One interesting means of self-persuasion may be analysts' frustration with the really hard problem. This frustration may lead analysts to try something new.[174] Such frustration occurs more often among experienced analysts. Years of attempting to make sense of overwhelming masses of information with inadequate analytic paradigms and technologies leaves some experienced analysts willing to grasp at anything that will improve how they work. On the other hand, newly hired analysts who have not yet experienced the frustration of inadequate paradigms for analysis may be resistant to adopting rigorous analytic paradigms such as that afforded by critical thinking.[175]

Transforming Intelligence Corporations

In order for an institution to change, all affected personnel, from the lowest to the highest, must first recognize that change is needed and is advantageous – both corporately and personally. As retired World Bank executive Stephen Denning argues, this is difficult to accomplish. Logically sound arguments do not sway employees. Instead, employees remain convinced that what they are doing is satisfactory.[176] Further, outsiders who attempt to induce change face opposition because employees presume that external consultants are arrogant in suggesting that things are not right, and that change is needed.

One way to effect change is through a "springboard story." This approach contrasts with past conventional – and largely unsuccessful – transformation efforts that relied on fixing the systems involved and were characterized by an overabundance of buzzwords:

> Enhance quality. Streamline procedures. Reform and flatten the organizational structure. Analyze things in terms of grids and charts. Develop plans in which individuals are programmed to operate like so many obedient computers. Hone our interpersonal mechanics and build skill inventories. Bring to our difficulties a fix-it attitude, as though our past errors can be easily corrected with straightforward explanations.[177]

---

176 For a discussion of Denning's philosophy about change, see Jeff de Cagna, "Making Change Happen: Steve Denning Tells the Story of Storytelling," Information Outlook, January 2001, 28–35, and Stephen Denning, *The Springboard: How Storytelling Ignites Action in Knowledge-Era Organizations* (Boston, MA: Butterworth-Heinemann, 2001). Cited hereafter as Denning, Springboard.

177 Denning, *Springboard,* xvii. In 23 years of Intelligence Community work, the author heard all of these phrases as slogans for various programs designed to "fix" analysis or the corporations involved. These associated corporate efforts to bring these goals about often had the opposite effect. In the process of "flattening

As Denning points out, these strategies fail to account for the messy and chaotic reality in which real organizations live and work, especially intelligence agencies which have the charter to engage honestly with "the other," or mission-related targets, outside of the bureaucracy in which they serve.[178]

The springboard story helps employees at all levels envision what is needed for the proposed transformation. Denning asserts that it "invites them to see analogies from their own backgrounds, their own contexts, their own fields of expertise."[179] He cautions that transformational stories are not a panacea – there are situations and circumstances in which they are not effective, such as when the change being proposed is a bad idea.[180] The key is finding the appropriate stories within the corporate culture.

One way to find these stories is to examine the best practices of intelligence analysis successes where critical thinking played a role. Just recounting a success is not enough. Listeners need to be able to identify and empathize with the scenario and its actors. The effective story is "about people who have lived [a] knowledge-sharing idea and how things happen in a real-life situation."[181] For example, conducting a trial or experiment on critical thinking within the intelligence analysis process, if it leads to certifiable, actionable success, *does* effectively persuade.

Learning from Early Adopters

Once a sustained number of early adopters openly apply systematic, critical thinking to hard analytic problems, the stage is set for a "tipping point" in the spread of structured methods across

---

the organization" at one intelligence agency, more hierarchical managerial layers were actually created!

178 Denning, *Springboard,* xvii.

179 Denning, *Springboard,* xix.

180 Denning, *Springboard,* xxi.

181 Denning, *Springboard,* 51.

analytic populations.[182] Stanley Feder recounts how a tipping point began to apply to a political analysis method at the CIA in the 1970s and 1980s. The method involved two estimative tools known as Factions and Policon that were used by the "Intelligence Directorate and the National Intelligence Council's Analysis Group to analyze scores of policy and instability issues in over 30 countries."[183] The reasons for the adoption of these tools remain the same: "Forecasts and analyses…have proved to be significantly more precise and detailed than traditional analyses."[184] Writing about the method in 1987, Feder predicted that its use would continue to expand.[185] The method is still in use 19 years after Feder's article was published. However, expanded use failed – perhaps because the tool was on a computer platform that ceased to be supported by the Agency. The recent transfer of the tool to a new suite of programs corresponds with observations that its use is once again expanding.[186]

Non-intelligence-related transformational stories can be applied in the Intelligence Community to facilitate the spread of new ways

182 Malcolm Gladwell, *The Tipping Point: How Little Things Can Make a Big Difference* (Boston, MA: Little Brown and Company, 2000), 15–29. Gladwell shows how "social epidemics" can infect a variety of domains.

183 Stanley Feder, "Factions and Policon: New Ways to Analyze Politics," in H. Bradford Westerfield, ed., *Inside CIA's Private World: Declassified Articles from the Agency's Internal Journal, 1955–1992* (New Haven, CT: Yale University Press, 1995), 275. Cited hereafter as Feder, "Factions and Policon."

184 Feder, "Factions and Policon," 292.

185 Feder, "Factions and Policon," 292. Feder was wrong about its sustained popular growth.

186 This story is not an isolated instance. In the author's experience, initial implementation and popularization are often followed by a gradually reduced user-base. Certain organizations find the tools useful and they tend to continue to use them even though any underlying technology may be obsolete. In the case of Factions and Policon, the tools were maintained on an aged Macintosh computer. They were updated in 2006 as part of the work of an intelligence research firm in New Mexico. The Factions tool was rewritten and included in Landscape Decision®, a suite of modeling and simulation tools developed under a research contract with the Department of Defense's Advanced Research and Development Activity (ARDA). The updated technology was reinserted into the tasking organization. Other technology transfers are pending.

of thinking. For example, two video commercial advertisements from the Electronic Data System (EDS) company resonate with the challenge of rebuilding intelligence analysis in the face of skeptics, and what it takes to be an intelligence analyst.[187] The two related commercials depict farcical situations based on two well-known clichés: "You've got to build it before you can fly it!" and "It's like herding cats; it can't be done!" In the former, a group of mechanics is building an airplane in mid-flight; while in the other, a group of cowboys has accomplished the impossible – they are herding cats across the Great Plains. EDS' depiction of its revolutionary design capabilities bears a message about corporate rebuilding and individual transformation. The message encourages managers and analysts to compare themselves and their situation to the people tasked with building an airplane at "60,000 feet," or with herding cats across a river.

Intelligence analysts and managers who have seen the videos have had little trouble drawing analogies with the corporate and personal transformations needed in the Intelligence Community. That the situations are humorous only adds to a viewer's buy-in – they are "hooked" before they realize it. Developing other stories that specifically apply to corporate transformation within the Intelligence Community and its various elements is a logical next step in encouraging analysts and managers to use and support critical thinking in analysis. If these stories can be drawn from recent analytic successes, their value can only increase.

The Costs and Benefits of Thinking Critically

Are intelligence failures inevitable if analysts lack critical thinking skills? Yes. However, critical thinking is not a panacea. Intelligence failures still can be expected. If no measure "will guarantee that accurate conclusions will be drawn from the incomplete and ambiguous information that intelligence analysts

187 See *Building Airplanes in Flight*, television advertisement produced for EDS by Fallon-McElligott, November 2000, videocassette; and *Herding Cats,* television advertisement produced for EDS by Fallon-McElligott, January 2000, videocassette.

typically work with…[and] occasional failures must be expected," why should the Intelligence Community invest in teaching its analytic workforce to think critically?[188] A brief review of the causes of failure clarifies the need for such an investment.

Intelligence failures occur in both systematic and functional domains. Systematic intelligence failures occur when producers fail to notice phenomena and the consumers of intelligence fail to heed warnings or even to notice that they are being warned. It may be that both consumers and producers are focused on other issues at the time. Alternatively, intelligence-based warning is not taken seriously at high official levels. In cases where collaboration among intelligence agencies might be critical, key evidence may not be recognized and shared.

All of these failings are illustrated in the "intelligence failure" to warn of the attacks of 11 September 2001 on the World Trade Center in New York and the Pentagon near Washington, DC. In the first place, the policy issue that was at the forefront – according to press at the time – was a national missile defense system, not the likelihood of a terrorist attack on the United States. Richard Clarke, the Clinton and then Bush administrations' terrorism "czar" observes that Bush administration officials were slow to recognize or consider the threats posed by Osama bin Laden.[189] Evidence passed by an FBI field agent about students learning to fly large aircraft with little regard for landing or takeoffs was not taken seriously at higher levels within the Bureau.[190] The Joint Congressional investigation into the attacks noted in its report that collaboration was lacking between agencies, especially between the law enforcement and strategic

intelligence agencies.[191] This was both a cultural and a physical phenomenon. Airport security breaches during the summer of 2001 may have been related, but based on assessments of the catastrophe, were not connected to the events.[192]

The same kinds of failings were identified by the Senate Select Committee on Intelligence in its assessment of the National Intelligence Estimate on Iraqi WMD. As has already been observed, analysts and their managers were focused on the results and not the process.[193]

Critical thinking can mitigate some common causes of failure and provide means by which they can be avoided in the future. Specifically, an intelligence process based on critical thinking offsets the following failures:

Analysts are Wrong. It is unrealistic to expect that analysts can always be correct. Regardless of the processes they employ, analysts make errors and fail. Anthropologist Rob Johnston defines *errors* as "factual inaccuracies in analysis resulting from poor or missing data." Conversely, intelligence *failures* are "systemic organizational surprise resulting from incorrect, missing, discarded, or inadequate hypotheses."[194] Critical thinking mitigates these by providing means to assess errors in reasoning as they occur and before they become

191 U.S. Congress, *Joint Inquiry into Intelligence Community Activities Before and After the Terrorist Attacks of September 11, 2001,* Report of the U.S. Senate Select Committee on Intelligence and U.S. House Permanent Select Committee On Intelligence, Together with Additional Views, Senate Report No. 107–351/House Report. No. 107–792, 107th Congress, 2nd Session, December 2002, xvi.

192 The author recalls that media reports of persons hopping over or otherwise improperly passing airport security checkpoints in and around Boston, New York, and Washington seemed to be higher than usual during the summer of 2001.

193 DNI Negroponte, in the *National Intelligence Strategy of the United States* (October 2005, 2) highlights the notion that the Community appropriately undertakes study of its internal processes, as well as of the quality of its products, by addressing both "enterprise" objectives as well as "mission" objectives.

194 Johnston, *Analytic Culture,* 6.

systemic failures. Such a meta-cognitive approach to the analytic process helps keep it under active review at the highest levels.

Policymakers Ignore Intelligence.[195] A critically thinking analytic population cannot directly affect what a policymaker can or will do – neither in fact, can a *non-critically thinking* analytic population. What critically thinking analysts can do, however, is present more effective assessments, perhaps leading policymakers to question their own assumptions on the issues. Additionally, thinking critically about how analysts interact with policymakers can identify ways to restructure the analysis dissemination process to involve policymakers more effectively. Such a process might also encourage them to adopt some of the attributes of critical thinking leading to (it may be presumed) more effective policy.[196]

Adversary Denies and Deceives. Critical thinking reduces the effects of adversarial denial and deception by leading analysts to consider alternative possibilities, to question biases and assumptions, to examine systematically the validity of evidence being considered, and to take seriously anomalies in the evidence.

Adversary is More Capable. In any adversarial system, there are winners and there are losers. While analysts can do everything possible to ensure their work is correct, they rarely work with all the evidence, and indeed may still be deceived. In such cases, they may come to wrong conclusions. Critical

---

195 There is a "classic" argument as to whether this is or is not an "intelligence" failure. In summary, the two sides condense as follows: On the one hand, intelligence should have been so persuasively presented as to compel the policymaker to pay attention. On the other hand, intelligence should not be telling the policymaker what to do. The argument goes all the way to the roots of the post-World War II strategic intelligence system currently in place. Former CIA analyst Jack Davis summarizes the issue in "The Kent-Kendall Debate of 1949," *Studies in Intelligence* 35, no. 2 (Summer 1991): 37–50.

196 Cooper, email to the author, 31 March 2006. Cited hereafter as Cooper, email, 31 March 2006.

> thinking, however, by providing structure and oversight to their reasoning, provides an audit trail. In this case, the means by which the analytic conclusions were reached can be subsequently reviewed, errors and deceptions revealed, and steps taken to improve the process so that the failure is not repeated**.** Indeed, because of its focus on the process, critical thinking becomes a powerful tool for evaluating and enhancing analytical reasoning.

Investment in critical thinking as part of the analysis process minimizes the likelihood of specific failures. With critical thinking essential to so many parts of the intelligence production process, enhancing it increases the likelihood of intelligence success.[197] With the cost of failure catastrophically high, the Intelligence Community is well advised to improve the likelihood of intelligence success, including improving critical thinking. As diplomat Richard Holbrooke opined in 2003, "intelligence is…indispensable. And its greatest successes are preventative."[198]

There are other reasons why systemic intelligence failures occur. Jeffrey Cooper considers ten pathologies, summarized in table 6, that impede successful analysis at both the individual and corporate levels. Cooper specifically believes that given the

> [emphasis] on the systemic nature of the pathologies that afflict intelligence analysis, structured analytic methods

---

197 One metric for intelligence is decreasing intelligence failures. In this case, fewer failures could be considered as "improving intelligence." But the reasons for the prevention of the failures need to be considered. The reduced number of failures could be due to a critically thinking workforce. Or it could be due to coincidences. Although a pointed discussion of metrics for intelligence is beyond the scope of this paper, recent articles explore the issue of intelligence metrics. See, for example, David T. Moore, Lisa Krizan, and Elizabeth J. Moore, "Evaluating Intelligence: A Competency-Based Model," *International Journal of Intelligence and Counterintelligence* 18, no. 2 (Summer 2005): 204–220.

198 Richard Holbrooke, in Judith Miller, "A Battle of Words Over War Intelligence," *New York Times,* online edition, 22 November 2003, URL: <www.nytimes.com/2003/11/22/arts/22INTE.html>, last accessed November 28, 2003.

Cooper's Analytic Pathology	Description
Inefficient "Account" Structure	Work is subdivided into accounts with ownership; provides basis for accountability; ownership inhibits sharing, cooperation, and collaboration; encourages "stovepiping" in collection disciplines.
Evidence-Based Scientism	Descriptive and explanatory intelligence support current policy and military operations; less support for anticipatory intelligence; analysis needs to be "augmented and leavened with intuition, curiosity, and a thirst for discovery – all essential elements of good science."
Tyranny of Current Intelligence	Response to customers' current concerns; support to current, ongoing military operations; little long-term research.
Over-Emphasis on Production	Databases need filling; scheduled reports and assessments must be produced on time; metrics for success measure data collected and processed; number of reports issued used to determine and justify resources allocated.
Over-Reliance on Previous Judgments	Previous reports presumed to be authoritative; previous reports combined to form new judgments; agreed-upon positions retained despite newer contradictory evidence.

Table 6: Cooper's Analytic Pathologies

Source: Summarized from Cooper, *Pathologies*, 30–39.

> become a first line of defense in preventing the networks of errors from developing – they are like "ripstops" that keep problems from propagating into wider "error-inducing systems," in [Charles] Perrow's terms.[199]

199 Jeffrey Cooper, email to the author, 31 March 2006. Cooper refers to Charles Perrow, *Normal Accidents: Living with High-Risk Technologies* (Princeton, NJ: Princeton University Press, 1999).

Cooper's Analytic Pathology	Description
Neglect of Research	Short–term taskings prevent longer–term research; reward structure favors current reporting, not longer term work; stunts development of deep target expertise.
Neglect of Anticipatory Intelligence	"Information Revolution" leaves intelligence competing with journalism and Internet for policymakers' attention; lack of predictive intelligence against new emerging threats ensures continuing failures to warn.
Loss of "Keystone Species" and "Intellectual Middleware"	Periodic reductions in force skew analyst demographics; "Keystone Species" (journeymen analysts) lacking; journeymen do bulk of professional maintenance; essential for knowledge retention and transfer to apprentices; maintain "intellectual Middleware" or deep understanding of analytic domains and processes.
Lack of Analytic Tools and Methods of Validation	Available and proposed tools not formally validated for accuracy and usefulness; focus on results, not processes, to determine success.
Hindrances of Security Mindset	Security procedures impede multi–source analysis; protection of sources and methods more important than "effective exploitation and cross–fertilization;" artificial and outdated mission distinctions prevent collaboration.

Critical thinking combats this by enhancing the processes by which decisions are made and by which such processes are reviewed. This paper focuses primarily on *individual experience*, and of course, intelligence corporations are made up of individuals. If a sufficient number of intelligence professionals are thinking critically, it is likely they will transform their corporations, if only through the sheer attrition of non-critically thinking managers and leaders who are

retiring from the work force. It should be observed that an Intelligence Community enterprise-wide emphasis on developing critical thinking skills at all levels would speed the process.

Validation

A critically thinking Intelligence Community remains essential for effective intelligence reform. Steven Rieber and Neil Thomason advance this argument in their recent article. The authors assert that "the opinions of experts regarding which methods [of analysis] work may be misleading or seriously wrong."[200] Unfortunately, as the authors show, past (and present) efforts at intelligence reform rely on expert intuitive judgments. However, "[examples] from a wide range of fields show that expert opinion about which methods work are often [not only] dead wrong…but also are generally not self-correcting."[201] Further support of Rieber's thesis is seen in devil's advocacy – not as theoretically applicable but as practiced. They cite Irving Janis who, quoting a Stanford political scientist, notes that "instead of stirring up much-needed turbulence among the members of a policymaking group, [devil's advocacy] may create 'the comforting feeling that they have considered all sides of the issue.'"[202]

To mitigate this and similar analysis-improvement fallacies, Rieber and Thomason argue that improvements in analysis and any proposed methods of judgment and decision-making require validation through scientific study. They note, for example, that research reveals "[a] certain cognitive style, marked by an open-mindedness and skepticism toward grand theories, is associated with

---

201 Rieber and Thomason, "Creation of a National Institute for Analytic Methods," 72.

202 Irving L. Janis, *Groupthink: Psychological Studies of Policy Decisions and Fiascoes*, 2nd edition. (Boston, MA: Houghton Mifflin and Company, 1982), 268. Referenced in Rieber and Thomason, "Creation of a National Institute for Analytic Methods," 73.

substantially better judgments about international affairs."[203] As the present paper has argued, such attitudes are found in critical thinkers. Scientific study of this and other methods will determine when and how they are appropriate. Critical thinking also supports Rieber and Thomason's call for a "National Institute for Analytic Methods" by providing an overarching structure to champion open-mindedness and skepticism in the study of which methods are appropriate for intelligence analysis. Only then, they argue, will real intelligence reform and improvement occur.

Rieber and Thomason's proposed institute could determine which strategies are most effective at disposing analysts and their corporations to employ critical thinking. Research evidence indicates that simply teaching critical thinking (or for that matter, structured analytic) skills is insufficient. People will not adopt the strategies unless motivated to do so. As noted here, springboard stories are one means of implanting a positive disposition toward critical thinking. Other means certainly also exist. A desirable objective of research in the proposed National Institute for Analytic Methods would be to discover and assess what might motivate analysts most effectively toward thinking critically.

203 Rieber and Thomason, "Creation of a National Institute for Analytic Methods," 74.

What Other Points of View Exist?

A recent best-selling book advances the comfortable idea that conscious reasoning may not confer advantage to the reasoner.[204] Recent research suggests that whereas simple choices may benefit from conscious thought, complex issues are best left to unconscious thought, or "deliberation-without-attention."[205] The explanation of this finding is that in conscious thinking, people face a severe limit on the number of factors that they can effectively consider simultaneously and, second, that in conscious thought people "inflate the importance of some attributes at the expense of others."[206] The authors base this finding on four experiments with subjects who were asked to indicate their preference for various consumer items. The experiments involved differing levels of complexity in terms of factors to be taken into consideration. They ultimately suggest that:

> [there] is no *a priori* reason to assume that the deliberation-without-attention effect does not generalize to other types of choices – political, managerial or otherwise. In such cases, it should benefit the individual to think consciously about simple matters and to delegate thinking about more complex matters to the unconscious.[207]

It appears true that the human capacity to weigh evidence *consciously* is limited to approximately seven factors.[208] But this seven-

---

204 Malcolm Gladwell, *Blink: The Power of Thinking Without Thinking* (New York, NY: Little Brown and Company, 2005). Gladwell argues that thinking does not require detailed assessment of information. Instead, rapid cognitive responses are adequate for decisionmaking.

205 Ap Dijksterhuis, Martin W. Bos, Loran F. Nordgren, and Rick B. von Baren, "On Making the Right Choice: The Deliberation-Without-Attention Effect," *Science* 311, no. 5763 (17 February 2006), 1005. Cited hereafter as Dijksterhuis, "Deliberation-Without-Attention."

item limit is easily extended: people can hierarchically consider multiple sets of seven items.[209] Employing structured methods of reasoning also extends this capacity. In this context, critical thinking is at once both a structuring method and a means of assessing and monitoring the processes of selecting and using other structured methods. Additionally, "deliberation-without-attention" as applied to consumer choices in the study noted above was measuring *preferences.* Preferences change from person to person – different people conclude differently about oven mitts and cars – as the variety of these products on the market, in kitchens, or on the roads makes clear.[210]

Intelligence analysis is not about preferences; it is about best answers in ambiguous situations with high-stakes implications and consequences. As recent intelligence failures make clear, without forced consideration of alternatives, results are biased. Structured reasoning methods such as Analysis of Competing Hypotheses (ACH) develop these alternatives, allow for multiple factors to be considered fairly, and extend analyst capacities to assess complex situations as accurately as possible.

Intuition is what both Dijksterhuis and Gladwell consider in their respective works. However, exactly *what is intuition?* Rather than just appearing from nowhere, intuition is "almost always informed by experience and hard knowledge won by reasoning things out."[211] As Michael LeGault notes,

> good decisions [are] a nuanced and interwoven mental process involving bits of emotion, observation, intuition, and critical thinking....The essential background to all this is a solid base of knowledge...The broader the base, the more likely all the parts will fit together.[212]

---

209 William Reynolds, conversation with the author, 14 March 2006.

210 Oven mitts and cars are two of the categories for which Dijksterhuis and his colleagues tested.

211 LeGault, *Think*, 12.

212 LeGault, *Think*, 12.

Uninformed "intuitive thinking" contributes to intelligence failures because it fails to reflect on presuppositions. Such unexamined biases and mindsets contributed to the Cuban missile intelligence failure described above. Heuer's outline of the specific biases and mindsets that impede effective analysis is reinforced by the findings of others.[213] For example, Merom, writing about the Cuban crisis, concludes that intelligence failures occur due to a "lack of commitment to fundamental principles of investigation and analysis."[214] Although intuition or "thin slicing" may be appropriate in some domains, in intelligence analysis it appears to be associated with cognitive impediments that cause costly intelligence failures.[215]

However, as Rieber and Thomason note, testing needs to be conducted to determine which methods do work best in which situations in intelligence analysis.[216] Their work ought to go further, developing and modifying methods to overcome the very limitations they identify. For example, investigators have found that ACH suffers from confirmation bias.[217] The present author notes that this may be because non-confirmatory reasoning is so difficult for people to do.[218]

---

213 See for example, Scott Plous, *The Psychology of Judgment and Decision-making* (New York, NY: McGraw Hill, Inc., 1993); Thomas Gilovich, Dale Griffin, and Daniel Kahneman, Eds. *Heuristics and Biases: The Psychology of Intuitive Judgment* (Cambridge, UK: Cambridge University Press, 2002); and Daniel Kahneman, Paul Slovic, and Amos Tversky, eds. *Judgment under Uncertainty: Heuristics and Biases* (Cambridge, UK: Cambridge University Press, 1982).

214 Merom, "Estimate," 49.

215 Gladwell introduces the notion of "thin slicing" as a reasoning strategy in *Blink*.

217 Brant A. Cheikes, Mark J. Brown, Paul E. Lehner, and Leonard Adelman, *Confirmation Bias in Complex Analyses,* Mitre Technical Report MTR 04B0000017 (Bedford, MA: Center for Integrated Intelligence Systems, October 2004).

218 The author teaches Analysis of Competing Hypotheses to both new and experienced analysts at the National Security Agency. He notes that holding a non-confirmatory attitude – which ACH, as developed by Heuer, requires – is

Finally, it may be a fallacy that conscious and unconscious reasoning are truly separate. Instead, Morgan Jones (citing work by Richard Restak) asserts that "the unconscious has a governing role in much that we consciously think and do."[219] This means that analysts commit a variety of "analytic sins," including focusing on the initially favored solution – which is also often the first satisfactory solution considered.[220] Part of the problem seems to arise from confusion about "'discussing/thinking hard' about a problem and 'analyzing' it, when the two activities are not at all the same."[221] Ultimately, the unconscious or instinctive approach to reasoning seems to "remain closed to alternatives."[222] This is an unsatisfactory model for intelligence analysis where alternatives *must* be considered.

---

extremely difficult for people to do. Since the method has value, a means of mitigating this difficulty is worth developing.

What Does the Future Hold?

Looking ahead, new paradigms for analysis become necessary in light of the many changes occurring across the globe. Rapidly emerging twenty-first century issues and challenges stress both infrastructures and sensemaking enterprises. The changes needed to maintain an edge against adversaries becomes clear as one considers what it is that analysts do, and how and when, as table 7 illustrates.

Gregory Treverton's observations about the evolution of intelligence sensemaking and the organizations that comprise the national intelligence enterprise suggest that current "reform" efforts are merely the first steps in a much lager – and fundamental – transformation. A careful, considered examination of what intelligence must accomplish and how this can be best achieved may ensure that the goals Treverton identifies as necessary for the future are met – and met sooner rather than later. Here again critical thinking has much to offer. By encouraging discussion of the alternatives and their advantages and disadvantages, and by examining analogous cases, critical thinkers aid the transformation. Questioning of assumptions about the roles of intelligence, its activity, and organization will reveal which long-held beliefs need retirement.

Further, technology efforts in support of analysis, such as those being developed through the efforts of the ARDA – and other – advanced technology efforts presume that analysts think critically. For instance, by focusing "analytic attention on the most critical information found within massive data,"[223] some research projects seek to uncover otherwise unknown information that indicates the potential for strategic surprise.[224] These projects seek to build

223 Critical information is that which is *essential* for analysts to make sense of what their targets are going to do. Often it is buried in massive amounts of "noise."

224 Advanced Research and Development Activity, *Broad Agency Announcement for the Novel Intelligence from Massive Data (NIMD) R&D Program,* NMA401–02–BAA–0004, 7 JUNE 2002, 1.

partnerships between analysts and technology applications.[225] In one case, a research firm has developed technology that enables analysts to generate and validate novel hypotheses, distill complex systems into digestible elements, create effective narratives, and inspire creative thinking.[226] Other examples are illustrated in the adjacent text box. Follow-on research efforts such as the Collaboration and Analyst/System Effectiveness (CASE) effort will develop these efforts further.[227] The intelligence workforce these ARDA-supported efforts presuppose is being hired and trained now.

The future also holds opportunities for further developing models of reasoning in intelligence. Exactly how analogy and critical thinking interact, the roles of creative thinking, the roles of intuition, and specific strategies for bias mitigation are all areas warranting further research. Formal validation of how critical thinking improves intelligence reasoning is another research topic. Rieber and Thomason's proposed National Institute of Analytic Methods is an obvious venue for such research. Additionally, the ARDA advanced questioning and answering research program, AQUAINT, as well as other ARDA programs dealing with predictive analysis, prior and tacit knowledge, and hypothesis generation offer other domains in which such research could occur.[228] Such research is of both intrinsic value and necessary for developing new means

225 The five areas on which the NIMD effort focused were modeling analysts and how they work; analysts' prior and tacit knowledge; creating, representing, and tracking multiple scenarios, hypotheses, and/or strategies; massive data management and analysis; and the means by which analysts interact with technology. The author represented his agency in evaluating and mentoring the efforts of the researchers.

226 The author is a technical mentor of this firm's work.

Issue	1970s and 1980s
Focus of Analysis	Continuing large, well-defined issues and adversaries
	Space for longer-term thinking
Organization and Workflow	Large, centrally organized and managed
	Hierarchical
	Institutional and operational memory mostly in analysts heads
	Time pressure persistent but low intensity (mostly)
Sources and Methods	Dominated by secret sources
	Analysts are separated from collectors
	Analysts mostly passive recipients of information
	Analysis focuses on previous patterns
	Analysts operate on basis of own experience and biases
Analysts' Characteristics	Many analysts are deep specialists
	Analysts mostly work alone or in small groups
	Key analytic choices with analysts

Table 7: Analysis: Past, Present and Future

Source: Developed by Gregory F. Treverton with input from the author.

1990s and 2000s	Future
Emergence of complex, rapidly shifting issues and adversaries	Complex, rapidly shifting issues and adversaries and large, well-defined issues and adversaries
Bias toward current intelligence	Both immediate question–answering and deeper analysis
Large, centrally organized and managed	Tailored to rapidly adapt to shifting foci
Still hierarchical, though problem-oriented "centers" added	Flat, problem-centric networks
Institutional and operational memory mostly in analysts heads	Technology helps to notice what analysts are watching and asking
Time pressure drives toward premature closure	Technology allows memory even of hypotheses, data rejected by analysts
Broader range of sources, but secrets still primary	Draws on a wide variety of sources, open and secret
Analysts are also their own collectors	Analysts are their own collectors
Limited searching of available data	Much more aggressive searching and reaching for data…both classified and unclassified
Same, though growing interest in new methods and tools for shaping, remembering, and examining hypotheses	Formative pattern recognition and data mining capabilities searches for out of the ordinary
Limited use of formal method and technology	Wide use of method and technology – from aggregating expert views to searching, data mining, pattern recognition
Many, perhaps most, analysts are generalists	Mix of generalists and deep specialists, both technical and political
Analysts mostly work alone or in small groups	Analysts work in larger virtual networks
Key analytic choices with analysts	Key analytic choices with analysts

Email exchanges 17–18 May 2006.

of improving intelligence analysis. Knowing the details of how analysts reason and how they might reason more effectively guides managers to understand where educational and training efforts can be most valuable.

TECHNOLOGICAL ADVANCES IN CRITICAL THINKING

One ARDA research team has created a technological system employing an automated critical thinking-based model that provides an overarching control structure for analytic reasoning. It includes both model generation (for counter–examples) and more traditional argument building. The system's creators assert – based on preliminary testing – that analysts employing the system are faster and more accurate problem solvers.

Suppose an analyst develops an argument in the course of using this system, that confirms that Saddam Hussein has WMD and an argument that confirms that Saddam does not have WMD. Working both sides of this issue, this analyst will make inferences from evidence and link them with other evidence-derived inferences. She will not imagine a situation in which all her evidence is true, but her hypothesis is not. For example, the evidence might include communications from which she infers that those communicating – including Saddam's scientists – believe they have WMD. Using the system, she also would be led to consider that the scientists might have wanted to deceive Saddam into believing that they were further along than they were. The generation of this alternative model can only arise through a mechanism that conducts the analyst away from the comfortable, inductive, confirmation path associated with the initial hypothesis.

Conclusion

> Never before in our peacetime history have the stakes of foreign policy been higher.
>
> —Sherman Kent, 1949

This paper posed the intriguing question: "How can intelligence analysts be 'really good'"? Critical thinking, if conceived and employed by intelligence analysts as suggested here, appears capable of leading analysts to adopt personal habits of thought appropriate to the resolution of hard intelligence problems. The idea that intelligence analysts are expected to bring to the table a capability to draw reasoned and actionable conclusions from scant and conflicting information distinguishes their charge from that of their academic brethren. Thus, intelligence analysts in government or other applied work environments may deserve the lavish budgets and technological capabilities they often enjoy.

To earn their high level of resource support, analysts can take advantage of a capability to redirect unique intelligence collection capabilities. In doing so, they are perfectly positioned to apply critical thinking methods to the hard problems. They can, for example, order up special collection against targets that exhibit even fleeting evidence that convincingly disconfirms one or more alternative hypotheses about an impending threat. This is the nub of Ben-Israel's argument for a "logical" approach to intelligence analysis for national security, and is an approach no doubt under-used by those who do not systematically think about threats in the manner developed in this paper.

Although most of the specific threats have changed since Sherman Kent first wrote in 1949, his epigraph remains as true today as it was then: the survival and prosperity of the United States remain at stake; they depend on effective, informed foreign policy.[229] Critical thinking brings with it an indispensable capability to inform a rational

229 Kent, *Strategic Intelligence,* ix.

foreign policy. "Really good analysts" are those who think critically about the issues they work and the problems they solve; they bring structured thought to the foreign policy realm.

Appendix

NSA's Critical Thinking and Structured Analysis Class Syllabus[230]

Background

Twenty-first Century intelligence issues involve uncertainty, mysteries, and risk. This differs from the 20th Century paradigms of security, secrets, and prevention. Analysis of current complex issues requires of its practitioners novel approaches including a productively imaginative process of inquiry. Questions an analyst asks not only serve as devices for attracting existing evidence, but also as devices for generating new evidence not presently considered. In this way, analysts more thoroughly examine complex issues and, aided by technology, are more likely to create novel intelligence and prevent strategic surprise.

However, such reasoning is at odds with how people – all people, including intelligence analysts – naturally think. Instead, people seek to confirm the first answer to a problem they discover, selectively using evidence to support that position *even when there is compelling evidence that an alternative hypothesis may actually be the correct one.* That people routinely fall prey to such poor thinking is well documented. Indeed, most commercial advertisers strive to take advantage of this. So do adversaries. One element of most intelligence failures includes poor thinking on the part of analysts—poor thinking of which adversaries have taken advantage. So how can analysts avoid such thinking?

One solution is to teach intelligence analysts to think critically.

230 This syllabus has been developed and refined by the author through several years of teaching critical thinking at the National Security Agency's National Cryptologic School. An early version of the course bore similarity to one developed by (then) MSGT Robert D. Folker, while a student at the (now) National Defense Intelligence College. Folker's course focused on the methods of analysis, not on the overarching critical thinking. His course (as written) is not taught at the college.

Critical thinking provides structure to the reasoning process that identifies for analysts where they are likely to go astray. It offers a means for self-reflective reasoning that leads to improved thinking. If such thinking is aided by structured analytic techniques, then analysts will (and do) improve how they resolve issues with which they are confronted. The quality of their work improves.

This critical thinking and analytic problem-solving course offers participants a chance to learn a paradigm for critical thinking and critically explore 14 different structured methods of analysis. Texts by critical thinking experts Richard Paul and Linda Elder, and structured analysis experts Morgan Jones and Richards Heuer, as well as materials developed by the instructor, teach the concepts and techniques. Classroom problems as well as operational examples (introduced and developed by the students from their own work) reinforce and help transfer what is learned into the operational environment. A final project developed by student teams completes the formal requirements.

Learning to think critically and to solve problems in a structured manner requires active participation. The class requires 40 hours of classroom time, consisting of ten sessions of four hours each. The method of instruction is Socratic, demanding active classroom participation. Participants also can expect homework, requiring both office and non-office time. Participants will prepare reading summaries for each class session, and develop one (or more) operational examples of at least one structured analytic method. Finally, participants work together on teams to complete classroom assignments and a final project dealing with an operational issue (employing at least five structured analytic methods).

Administration:

Enrollment: Up to 21 Students.
Class Date/Time/Duration: One 4-hour class per day for 10 weeks.
Class Location: _____.
Homework: Yes, but hopefully not too odious. Operational examples are required. A team project is due at the end of the course.

Texts:

Elder, Linda, and Richard Paul. *The Foundations of Analytic Thinking: How to Take Thinking Apart and What to Look for When You Do* (Dillon Beach, CA: Foundation for Critical Thinking, 2003).

Heuer, Richards J., Jr. *The Psychology of Intelligence Analysis* (Washington, DC: Center for the Study of Intelligence, 1999), URL: <http://cia.gov/csi/books/19104/index.html>, last accessed 15 March 2006.

Jones, Morgan D. *The Thinker's Toolkit: Fourteen Skills for Making Smarter Decisions* in B*usiness and in Life* (New York, NY: Crown Publishing Group, 1997).

Several handouts (TBD)

Objectives:

The overall objective of the class is to enable you to critically think about analysis and what analysts are tasked to analyze. A second objective is to provide you with a set of analytic tools that are useful to your analysis. At the end of the class you will be equipped with a set of analytic skills and will have honed your critical thinking skills, allowing you to better function in the workplace. Specifically, the course objectives are as follows:

Upon completion of this course you will be able to:

- Use critical thinking techniques to provide structure to your analytic reasoning.
- Identify, describe, and employ 14 methods for structured reasoning.
- Demonstrate critical thinking proficiency through lecture, classroom participation, and weekly homework assignments.
- Complete a final class assignment using a minimum of five structured analytic methods presented in this course.
- Apply knowledge of critical thinking by using a set of analytic tools designed to hone your skills as an analyst.

In other words, at the end of this 10-week-long class, you will have

- Learned to critically analyze intelligence-associated data, information, and evidence.
- Honed your critical thinking skills.
- Built a "toolbox" of analytic and problem-solving methods.
- Become better analysts.

For example, when you approach a problem you will be able to

- Discover the true problem by restating and considering alternative outcomes.
- Have a variety of methods by which you can organize and make sense of the relevant evidence.

Formal Requirements:

Written summaries of readings. (No more than one page per chapter assigned.) The summaries should answer ***exactly*** the questions on page five of the syllabus. The summaries should also include answers to the exercises in Morgan Jones' book. The summaries will be typed unless prior arrangements have been made with the instructor. In-class discussions will draw heavily on the readings.

Problems from the work environment (Operational Exemplars). As we study the elements of reasoning and the methods of problem solving, we need operational examples

against which to apply/illustrate what we are learning. You will be responsible for providing at least one of those examples for the class to be presented during the week we discuss the method. The best exemplars may be saved for use in subsequent classes.

Final project. Working in teams of three or four, and using any Problem Restatement and Divergent and Convergent Thinking plus at least three other methods developed in the course – for a total of of at least five methods – you will develop an operational project to be presented at the last class. You will apply the elements of critical thinking to the method chosen as well as the specific problem, apply the appropriate methods to solve of problem, report the results, and evaluate the process. The project will be presented during a 15–20 minute briefing. A list of the specific elements that must be included and the format by which the project is graded is on the last page of this syllabus.

Grading:

- **Written Summaries (25%).** Due weekly. The first summary will be graded. Subsequently, a random number generator will be used to select three (3) additional summaries for grading. Grading will be based on the "Universal Intellectual Standards" in *The Foundations of Analytic Thinking* and on whether instructions are followed. For example, if you are asked to identify what key questions an author is attempting to answer, *it is expected that you will provide those questions in the reading summary.*
- **Class Participation (25%).** Since this is a discussion course, you are expected to engage in the process.
- **Operational Exemplars (25%).** Assigned the first week. No longer than 5 minutes each.
- **Final Project (25%).**

Class Descriptions and Weekly Assignments (complete prior to each class):

Class 1 – How We Don't Think and How We Might

Reading Assignment: *The Thinker's Toolkit: Fourteen Skills for Making Smarter Decisions in Business and in Life*, Chapters 1–2 (Part One).
Psychology of Intelligence Analysis, 1–30.
Critical Thinking: Concepts and Tools, entire work.

Written Assignment: *Reading summaries for chapters from Jones and Heuer. Exercises in text.*

Class Objectives: *At the end of Class 1 you will be able to:*

- Define a bias and discuss the implications of biases in our decisions.
- Identify sources of cognitive biases.
- Describe the inherent dangers/benefits of biases and the difficulty of compensating for perceptual biases.
- Describe the characteristics and three principles of perception.
- Describe how analysts fall prey to absence-of-evidence biases.
- Describe how anchoring impacts analytical decision-making.
- Describe how a target can use assimilation biases to deceive.
- Acknowledge how analysts unwittingly use confirmation bias to support early assessments.
- Discuss how hindsight and reliability biases play a part in intelligence failures.
- Describe how oversensitivity to consistency bias can lead to undesirable results.
- Discuss how expert biases and the Pollyanna and Cassandra complexes distort our thinking.
- Describe how cultural, personal, and organizational

mindsets impact analysis.

- Define mindsets, discuss how they are derived, and describe how they influence predictions.
- Identify how we think.
- Describe critical thinking and the standards used for evaluating our thinking.
- Identify the elemental structures of thought.
- Describe the differences between inferences and assumptions in intelligence analysis.

Class 2 – Critical Problem Restatement and Alternative Thinking

Reading Assignment: *The Thinker's Toolkit: Fourteen Skills for Making Smarter Decisions in Business and in Life,* Chapters 3, 5.

Written Assignment*: Reading summaries for each chapter. Exercises in text.*

Class Objectives: *At the end of Class 2 you will be able to:*

- Demonstrate knowledge of the critical thinking process by providing an example that meets the universal intellectual standards.
- Describe the role of questioning in critical thinking.
- Identify the three types of questions used in critical thinking.
- Determine the sample domains involved in complex questions.
- Define problem restatement and apply its use through a practical example.
- Discuss the role that our biases play in problem restatement.
- Demonstrate knowledge of the critical thinking process by providing an example that meets the universal intellectual standards.
- Define divergent thinking and its benefits when performing a problem restatement.
- Discuss the pitfall involved in problem definition and how it relates to problem restatement.
- Describe some effective techniques for problem restatement.
- Identify the types of problems that benefit from problem restatement.
- Discuss how points of view influence the critical thinking process.
- Discuss the logic, benefits, risks, and elements of divergent thinking.
- Identify the four main ideas of divergent thinking.

- Describe what is needed to move from divergence to convergence.
- Identify the types of problems that benefit from divergent thinking.

Class 3 – Pollyanna, Cassandra, and Marshaling

Reading Assignment: *The Thinker's Toolkit: Fourteen Skills for Making Smarter Decisions in Business and in Life*, Chapters 4, 6.

Written Assignment*: Reading summaries for each chapter. Exercises in text.*

Class Objectives: *At the end of Class 3 you will be able to:*

- Discuss the pros-cons-fixes approach to critical thinking and the six-step method employed by successful analysts.
- Identify the logic behind the pros-cons-fixes approach and discuss those critical thinking problems best suited to this method.
- Apply the techniques of sorting, chronologies, and timelines to critical thinking and identify those critical thinking problems best suited for this approach.
- Identify the two-step technique used for sorted lists, chronologies, and timelines.

Class 4 – Causes, Squares, and Shrubs

Reading Assignment: *The Thinker's Toolkit: Fourteen Skills for Making Smarter Decisions in Business and in Life*, Chapters 7, 8, 9.

Written Assignment: *Reading summaries for each chapter. Exercises in text.*

Class Objectives: *At the end of Class 4 you will be able to:*

- Discuss the purpose, logic, underlying question, evidence, concepts, and types of problems best suited for causal flow diagramming.
- Identify the major factors and cause-and-effect relationships influencing causal flow diagramming.
- Characterize the differences between direct and inverse relationships and their impact on causal flow diagramming.
- Define a feedback loop and discuss what makes it stable or unstable.
- Apply your knowledge of causal diagramming by participating in a classroom exercise.
- Discuss the purpose, logic, underlying question, evidence, concepts, and types of problems best suited for scenario matrices and trees.
- Define and discuss the characteristics and differences between matrices and scenario trees.
- Apply your knowledge of scenario matrices by participating in a classroom exercise.
- Apply your knowledge of scenario trees by participating in a classroom exercise.

Class 5 – Weighing the Likelihood

Reading Assignment: *The Thinker's Toolkit: Fourteen Skills for Making Smarter Decisions in Business and in Life*, Chapters 10, 13.

Written Assignment: *Reading summaries for each chapter. Exercises in text.*

Class Objectives: *At the end of Class 5 you will be able to:*

- Discuss how individuals view issues.
- Discuss the purpose, logic, underlying question, evidence, concepts, and types of problems best suited for weighted ranking.
- List the 9-step process involved in weighted ranking.
- Demonstrate knowledge of weighted ranking through class and small group exercises.
- Discuss the purpose, logic, underlying question, evidence, concepts, and types of problems best suited for probability.
- Define and describe how and why we characterize and assign events, and how this influences intelligence analysis.
- Discuss and explain the differences between mutually exclusive and conditionally dependent events relative to probability.
- Identify the seven steps in creating a probability tree.
- Apply your knowledge of probability by participating in a classroom exercise.

Class 6 – Testing the Devil's and Other's Advocacy

Reading Assignment: *The Thinker's Toolkit: Fourteen Skills for Making Smarter Decisions in Business and in Life,* Chapters 11–12.
The Psychology of Intelligence Analysis, Chapter 8.

Written Assignment: *Reading summaries for each chapter. Exercises in text.*

Class Objectives: *At the end of Class 6 you will be able to:*

- Define intelligence.
- Discuss the purpose, logic, underlying question, evidence, concepts, and types of problems best suited for devil's advocacy.
- Define, describe, and characterize situations appropriate to employ methods of devil's advocacy in intelligence analysis
- Demonstrate prowess in devil's advocacy through participation in a practical case study.
- Discuss the purpose, logic, underlying question, evidence, concepts, and types of problems best suited for hypothesis testing.
- Discuss the benefits of hypothesis testing.
- Identify the 8-step process of hypothesis testing.
- Demonstrate prowess in hypothesis testing through participation in a practical case study.

Class 7 – Analyzing Apples and Toyotas

Reading Assignment*: The Thinker's Toolkit: Fourteen Skills for Making Smarter Decisions in Business and in Life*, Chapters 14, 15, 16.

Written Assignment: *Reading summaries for each chapter. Exercises in text.*

Class Objectives: *At the end of Class 7 you will be able to:*

- Describe how individual viewpoints influence utility analysis.
- Define utility analysis and discuss the type of problems best suited for this method.
- Identify the logic of utility analysis.
- Employ utility analysis to arrive at the most cost-effective solutions.
- List the steps involved in creating a utility tree and apply this knowledge by participating in classroom exercises.
- List the steps involved in creating a utility matrix and apply this knowledge by participating in classroom exercises.
- Examine the benefits of structuring as it applies to utility and probability analysis.
- Describe the differences between utility and probability analysis.
- Examine multi-perspective utility analysis and its use by participating in classroom exercises.
- List the 13 steps of multi-perspective utility analysis.
- Apply your knowledge of multi-perspective utility analysis by participating in a classroom exercise.

Class 8 – And Now for Something Completely Different

Reading Assignment: *Review all assigned readings.*

Written Assignment: *None.*

Class Objectives: *At the end of Class 8 you will be able to:*

- Describe which structured analysis methods work best in particular situations.
- Demonstrate knowledge of critical thinking and structured analysis through a practicum.
- Demonstrate your knowledge of critical thinking and structured analysis through a small group exercise.

Class 9 – Final Project Preparation

Reading Assignment: *Review all assigned readings.*

Written Assignment: *None.*

Class Objectives: *During Class 9 you will:*

- Learn through experience the pros and cons of research, analysis and reporting in small teams.

Class 10 – Final Project Presentation and Wrap-up

Reading Assignment: *Review all assigned readings.*

Written Assignment: *None.*

Class Objectives: *During Class 10:*

- Your small group will make a multi-media presentation on the analytic problem you chose.

Methods:

- A sample of the problem statement and restatement process.
- A sample of the convergent and divergent thinking applied to the problem.
- Concise demonstrations of the three structured analytic methods used to answer the analytic problem.

Assessment:

- **You are evaluated on how clearly the group presents its project, and on whether the project requirements listed above are met as shown on the last page of the syllabus.**

Reading Summary Questions:[231]

For each chapter/work, answer the following questions (in writing) about the reading.

1. What is the author's purpose? If there is more than one main point, what is the overarching purpose?

2. What are the key questions the author raises/addresses?

3. What evidence does the author provide to support his argument?

4. What inferences does the author make from the evidence?

5. On what underlying concepts does the author rely?

6. What does the author take for granted? What assumptions does the author make?

7. What are the implications of the author's point of view? What are the implications if we adopt/do not adopt what the author recommends?

8. What is the author's point of view? What other points of view are there?

231 Paul and Elder, *Concepts and Tools*, 13.

Final Project Evaluation Worksheet[232]

	Clarity	Accuracy	Precision	Relevance	Depth	Breadth	Logic	Significance	Fairness

About the Author

David T. Moore is a career senior intelligence analyst and technical director at the National Security Agency where he is an advocate for, and mentor of best practices in intelligence analysis. He is an adjunct faculty member of the National Cryptologic School; has taught at the National Defense Intelligence College, Washington, DC; and at Trinity University, Washington, DC. Mr. Moore holds a B.A. in sociology from Washington and Lee University and a Master of Science of Strategic Intelligence from the National Defense Intelligence College (formerly the Joint Military Intelligence College).

Mr. Moore's other publications include:

- "Species of Competencies for Intelligence Analysis," *Defense Intelligence Journal,* 11, no. 2 (Summer 2002): 97-119.
- "Species of Competencies for Intelligence Analysis," *American Intelligence Journal*, 23 (2005): 29–43 (an expanded version of the original article).
- With coauthor Lisa Krizan:
    - "Intelligence Analysis, Does NSA Have What it Takes," *Cryptologic Quarterly,* 20, nos. 1/2 (Summer/Fall 2001): 1-32.
    - "Core Competencies for Intelligence Analysis at the National Security Agency," in *Bringing Intelligence About: Practitioners Reflect on Best Practices,* Russell Swenson, ed. (2004): 95-131.
- With coauthors Lisa Krizan and Elizabeth J. Moore
    - "Evaluating Intelligence: A Competency-Based Approach," in the *International Journal of Intelligence and CounterIntelligence*, 18, no. 2 (Summer 2005): 204-220.
- With coauthor William N. Reynolds:

Colophon

A colophon records the details of the layout and design of a publication. It acknowledges the craftsmanship and art required in creating a printed work. Whereas the acknowledgements record the textual assistance an author receives, a colophon records the equally important technical assistance received.

This Occasional Paper was set in Baskerville, a transitional typeface created by Birmingham printer John Baskerville around 1752. George Jones redesigned it in 1930 for Linotype-Hell; the International Typeface Corporation licensed it in 1982. The long, elegant serifs and the subtle transfer of stroke weight from thick to very thin give it a delicacy and grace that makes it an excellent text typeface. Titling and primary headings were set in Castellar, a Monotype typeface created by John Peters in 1957. Named after a town in the Alps, Castellar also was designed for refined display work. Tables were set in Gill Sans, designed by artist and type designer Eric Gill in 1931 for Monotype. Unlike many sans serif typefaces it is highly legible and readable in text. The cover was set in Californian, a typeface originally designed by Frederic Goudy in 1938 and adapted by various designers for the Font Bureau.

This publication was composed on an Apple iMac and a Macbook Pro using Adobe Systems InDesign. Masters were created in Adobe Acrobat. Illustrations were prepared in Omni Systems Omni Graffle and Adobe Photoshop.

Baskerville, Californian, Castellar, Gill Sans, iMac, Macbook Pro, Acrobat, InDesign, Omni Graffle, and Photoshop are registered trademarks of their respective companies.

Desktop composition by the author.

The cover was designed by Bridgette White.

Published by the National Defense Intelligence College Press, May 2006; and by the National Defense Intelligence College Foundation, March 2007. Printed at the Defense Intelligence Agency, Washington DC.

All statements of fact, opinion, or analysis expressed in this book are those of the authors. They do not necessarily reflect official positions of the Central Intelligence Agency or any other US government entity, past or present. Nothing in the contents should be construed as asserting or implying US government endorsement of the authors' factual statements and interpretations.

The Center for the Study of Intelligence

The Center for the Study of Intelligence (CSI) was founded in 1974 in response to Director of Central Intelligence James Schlesinger's desire to create within CIA an organization that could "think through the functions of intelligence and bring the best intellects available to bear on intelligence problems." The Center, comprising professional historians and experienced practitioners, attempts to document lessons learned from past operations, explore the needs and expectations of intelligence consumers, and stimulate serious debate on current and future intelligence challenges.

To support these activities, CSI publishes *Studies in Intelligence* and books and monographs addressing historical, operational, doctrinal, and theoretical aspects of the intelligence profession. It also administers the CIA Museum and maintains the Agency's Historical Intelligence Collection.

ACKNOWLEDGEMENTS

There are literally slightly more than 1,000 people to thank for their help in developing this work. Most of them I cannot name, for one reason or another, but my thanks go out to all of those who took the time to participate in this research project. Thank you for your trust. Particular thanks are due the other researchers who coauthored chapters: Judith Meister Johnston, J. Dexter Fletcher, and Stephen Konya.

There is a long list of individuals and institutions deserving of my gratitude, but, at the outset, for making this study possible, I would like to express my appreciation to Paul Johnson and Woody Kuhns, the chief and deputy chief of the Central Intelligence Agency's Center for the Study of Intelligence, and their staff for their support and to John Phillips and Tom Kennedy of the Intelligence Technology Innovation Center who, along with their staff, administer the Director of Central Intelligence Postdoctoral Fellowship Program.

I would like to thank Greg Treverton and Joe Hayes for their help throughout this project and for their willingness to give of their time. Dr. Forrest Frank, Charles Perrow, and Matthew Johnson deserve recognition for the material they contributed. Although it was not possible to cite them as references for those contributions, these are indicated in the footnotes, and I give them full credit for their work and efforts.

I would also like to thank Bruce Berkowitz, Mike Warner, Fritz Ermarth, Gordon Oehler, Jeffrey Cooper, Dave Kaplan, John Morrison, James Wirtz, Robyn Dawes, Chris Johnson, Marilyn Peterson, Drew Cukor, Dennis McBride, Paul Chatelier, Stephen Marrin, Randy Good, Brian Hearing, Phil Williams, Jonathan Clemente, Jim Wilson, Dennis, Kowal, Randy Murch, Gordie Boezer, Steve Holder, Joel Resnick, Mark Stout, Mike Vlahos, Mike Rigdon, Jim Silk, Karl Lowe, Kevin O'Connell, Dennis Gormley, Randy Pherson, Chris Andrew, Daniel Serfaty, Tom Armour, Gary Klein, Brian Moon, Richard Hackman, Charlie Kisner, Matt McKnight, Joe Rosen, Mike Yared, Jen Lucas, Dick Heuer, Robert Jervis, Pam Harbourne, Katie Dorr,

Dori Akerman, and, most particularly, my editors: Mike Schneider, Andy Vaart, and Barbara Pace. Special thanks are also due Adm. Dennis Blair, USN (Ret.), and Gen. Larry Welch, USAF (Ret.), and their staff.

There were 50 peer reviewers who made sure I did not go too far afield in my research and analysis. Again, there are mitigating reasons why I cannot thank them by name. Suffice it to say, their work and their time were invaluable, and I appreciate their efforts.

Because I cannot name specific individuals, I would like to thank the organizations of the Intelligence Community that gave me access to perform this research and made available research participants: Air Force Intelligence; Army Intelligence; Central Intelligence Agency; Defense Intelligence Agency; Department of Energy; Department of Homeland Security; Bureau of Intelligence and Research, Department of State; Department of the Treasury; Federal Bureau of Investigation; Marine Corps Intelligence; National Geospatial Intelligence Agency; National Reconnaissance Office; National Security Agency; Navy Intelligence.

Thanks are also due the following: Institute for Defense Analyses; the Sherman Kent Center and the Global Futures Partnership at the CIA University; the CIA's Publications Review Board; Office of Public Affairs, National Archives; Joint Military Intelligence College; Advanced Research and Development Activity, Defense Advanced Research Projects Agency (DARPA); International Association of Law Enforcement Intelligence Analysts; Drug Enforcement Administration and the DEA Academy; FBI Academy; National Military Intelligence Association; Association of Former Intelligence Officers; MITRE; RAND; Analytic Services, Inc. (ANSER); Potomac Institute; Center for Strategic and International Studies; Woodrow Wilson International Center; Booz Allen Hamilton; Naval Postgraduate School; Columbia University; Dartmouth College; University of Pittsburgh; Georgetown University; Carnegie Mellon University; Cambridge University; Johns Hopkins University and the Advanced Physics Laboratory; George Mason University; Harvard University; Yale University; American Anthropological Association; Society for the Anthropology of Work; Society for Applied Anthropology; National Association for the Practice of Anthropology; Inter-University Seminar on Armed Forces and Society; Royal Anthropological Institute, and the national laboratories.

I express my sincere apologies if I have failed to include any individuals or organizations to which thanks are due. Moreover, any errors of commission or omission are my own. God knows, with this much help, there is no one to blame but myself. Mostly, though, I would like to thank my long-suffering wife, to whom this book is dedicated. Thanks, Jude.

The Author 161

FOREWORD

Gregory F. Treverton

It is a rare season when the intelligence story in the news concerns intelligence analysis, not secret operations abroad. The United States is having such a season as it debates whether intelligence failed in the run-up to both September 11 and the second Iraq war, and so Rob Johnston's wonderful book is perfectly timed to provide the back-story to those headlines. The CIA's Center for the Study of Intelligence is to be commended for having the good sense to find Johnston and the courage to support his work, even though his conclusions are not what many in the world of intelligence analysis would like to hear.

He reaches those conclusions through the careful procedures of an anthropologist—conducting literally hundreds of interviews and observing and participating in dozens of work groups in intelligence analysis—and so they cannot easily be dismissed as mere opinion, still less as the bitter mutterings of those who have lost out in the bureaucratic wars. His findings constitute not just a strong indictment of the way American intelligence performs analysis, but also, and happily, a guide for how to do better.

Johnston finds no baseline standard analytic method. Instead, the most common practice is to conduct limited brainstorming on the basis of previous analysis, thus producing a bias toward confirming earlier views. The validating of data is questionable—for instance, the Directorate of Operation's (DO) "cleaning" of spy reports doesn't permit testing of their validity—reinforcing the tendency to look for data that confirms, not refutes, prevailing hypotheses. The process is risk averse, with considerable managerial conservatism. There is much more emphasis on avoiding error than on imagining surprises. The analytic process is driven by current intelligence, especially the CIA's crown jewel analytic product, the *President's Daily Brief* (PDB), which might be caricatured

as "CNN plus secrets." Johnston doesn't put it quite that way, but the Intelligence Community does more reporting than in-depth analysis.

None of the analytic agencies knows much about the analytic techniques of the others. In all, there tends to be much more emphasis on writing and communication skills than on analytic methods. Training is driven more by the druthers of individual analysts than by any strategic view of the agencies and what they need. Most training is on-the-job.

Johnston identifies the needs for analysis of at least three different types of consumers—cops, spies, and soldiers. The needs of those consumers produce at least three distinct types of intelligence—investigative or operational, strategic, and tactical.

The research suggests the need for serious study of analytic methods across all three, guided by professional methodologists. Analysts should have many more opportunities to do fieldwork abroad. They should also move much more often across the agency "stovepipes" they now inhabit. These movements would give them a richer sense for how other agencies do analysis.

Together, the analytic agencies should aim to create "communities of practice," with mentoring, analytic practice groups, and various kinds of on-line resources, including forums on methods and problem solving. These communities would be linked to a central repository of lessons learned, based on after-action post-mortems and more formal reviews of strategic intelligence products. These reviews should derive lessons for individuals and for teams and should look at roots of errors and failures. Oral and written histories would serve as other sources of wherewithal for lessons. These communities could also begin to reshape organizations, by rethinking organizational designs, developing more formal socialization programs, testing group configurations for effectiveness, and doing the same for management and leadership practices.

The agenda Johnston suggests is a daunting one, but it finds echoes in the work of small, innovative groups across the Intelligence Community—groups more tolerated than sponsored by agency leaders. With the challenge workforce demographics poses for the Community—the "gray-green" age distribution, which means that large numbers of new analysts will lack mentors as old hands retire—also comes the opportunity to refashion methods and organizations for doing intelligence analysis. When the finger-pointing in Washington subsides, and the time for serious change arrives, there will be no better place to start than with Rob Johnston's fine book.

INTRODUCTION

In August 2001, I accepted a Director of Central Intelligence postdoctoral research fellowship with the Center for the Study of Intelligence (CSI) at the Central Intelligence Agency. The purpose of the fellowship, which was to begin in September and last for two years, was to identify and describe conditions and variables that negatively affect intelligence analysis. During that time, I was to investigate analytic culture, methodology, error, and failure within the Intelligence Community using an applied anthropological methodology that would include interviews (thus far, there have been 489), direct and participant observation, and focus groups.

I began work on this project four days after the attack of 11 September, and its profound effect on the professionals in the Intelligence Community was clearly apparent. As a whole, the people I interviewed and observed were patriotic without pageantry or fanfare, intelligent, hard working, proud of their profession, and angry. They were angry about the attack and that the militant Islamic insurgency about which they had been warning policymakers for years had murdered close to 3,000 people in the United States itself. There was also a sense of guilt that the attack had happened on their watch and that they had not been able to stop it.

Having occurred under the dark shadow of that attack, this study has no comparable baseline against which its results could be tested, and it is difficult to identify biases that might exist in these data as a result of 11 September. In some ways, post-9/11 data may be questionable. For example, angry people may have an ax to grind or an agenda to push and may not give the most reliable interviews. Yet, in other ways, post-9/11 data may be more accurate. When people become angry enough, they tend to blurt out the truth—or, at least, their perception of the truth. The people I encountered were, in my judg-

ment, very open and honest; and this, too, may be attributable to 9/11. In any case, that event is now part of the culture of the Intelligence Community, and that includes whatever consequences or biases resulted from it.

Background

The opportunity to do this research presented itself, at least in part, as a result of my participation in a multiyear research program on medical error and failure for the Defense Advanced Research Projects Agency (DARPA).[1] The DARPA research focused on team and individual error in minimally invasive or laparoscopic surgical procedures. This research revealed that individual errors were cognitive rather than purely psychomotor or skill-based. For example, some surgeons had trouble navigating three-dimensional anatomical space using the existing laparoscopic technology, with the result that these surgeons would identify anatomical structures incorrectly and perform a surgical procedure on the wrong body part.

Other individual errors were discovered during the DARPA studies, but, for the most part, these were spatial navigation and recognition problems for which there were technological solutions. Team errors, unlike individual errors, proved to be more challenging. The formal and informal hierarchical structures of operating rooms did not lend themselves to certain performance interventions. Generally, junior surgical staff and support personnel were not willing to confront a senior staff member who was committing, or was about to commit, an error.

The culture of the operating room, coupled with the social and career structure of the surgical profession, created barriers to certain kinds of communication. For a surgical resident to inform a senior surgeon in front of the entire operating room staff that he was about to cut the wrong organ could result in career "suicide." Such a confrontation could have been perceived by the senior surgeon as a form of mutiny against his authority and expertise and a challenge to the social order of the operating room. Although not universal, this taboo is much more common than surgeons would care to admit. Unlike individual errors, purely technological solutions were of little value in trying to solve team errors in a surgical environment.

The DARPA surgical research was followed up by a multiyear study of individual and team performance of astronauts at the National Aeronautics and Space Administration's (NASA) Johnson Space Center. Results of the NASA study, also sponsored by DARPA, were similar to the surgical study

[1] Rob Johnston, J. Dexter Fletcher and Sunil Bhoyrul, *The Use of Virtual Reality to Measure Surgical Skill Levels*.

with regard to team interactions. Although, on the face of it, teams of astronauts were composed of peers, a social distinction nevertheless existed between commander, pilots, and mission specialists.

As with surgery, there was a disincentive for one team member to confront or criticize another, even in the face of an impending error. Eighty percent of the current astronauts come from the military, which has very specific rules regarding confrontations, dissent, and criticism.[2] In addition to the similarities in behavior arising from their common backgrounds, the "criticism" taboo was continually reinforced throughout the astronaut's career. Virtually any negative comment on an astronaut's record was sufficient for him or her to be assigned to another crew, "washed out" of an upcoming mission and recycled through the training program, or, worse still, released from the space program altogether.

Taboos are social markers that prohibit specific behaviors in order to maintain and propagate an existing social structure. Generally, they are unwritten rules not available to outside observers. Insiders, however, almost always perceive them simply as the way things are done, the natural social order of the organization. To confront taboos is to confront the social structure of a culture or organization.

I mention the surgical and astronautical studies for a number of reasons. Each serves as background for the study of intelligence analysts. Astronauts and surgeons have very high performance standards and low error rates.[3] Both studies highlight other complex domains that are interested in improving their own professional performance. Both studies reveal the need to employ a variety of research methods to deal with complicated issues, and they suggest that there are lessons to be learned from other domains. Perhaps the most telling connection is that, because lives are at stake, surgeons and astronauts experience tremendous internal and external social pressure to avoid failure. The same often holds for intelligence analysts.

In addition, surgery and astronautics are highly selective and private disciplines. Although their work is not secret, both groups tend to be shielded from the outside world: surgeons for reasons of professional selection, training, and the fiscal realities of malpractice liability; astronauts because their community

---

[2] National Aeronautics and Space Administration, *Astronaut Fact Book*.

[3] NASA has launched missions with the shuttle fleet 113 times since 1981 and has experienced two catastrophic failures. It is probable that both of those were mechanical/engineering failures and not the result of astronaut error. Surgical reporting methods vary from hospital to hospital, and it is often difficult to determine the specific causes of morbidity and mortality. One longitudinal study of all surgical procedures in one medical center puts the surgical error rates at that center between 2.7 percent and 7.5 percent. See Hunter McGuire, Shelton Horsley, David Salter, et al., "Measuring and Managing Quality of Surgery: Statistical vs. Incidental Approaches."

is so small and the selection and training processes are so demanding.[4] Intelligence analysts share many of these organizational and professional circumstances.

The Intelligence Community is relatively small, highly selective, and largely shielded from public view. For its practitioners, intelligence work is a cognitively-demanding and high-risk profession that can lead to public policy that strengthens the nation or puts it at greater risk. Because the consequences of failure are so great, intelligence professionals continually feel significant internal and external pressure to avoid it. One consequence of this pressure is that there has been a long-standing bureaucratic resistance to putting in place a systematic program for improving analytical performance. According to 71 percent of the people I interviewed, however, that resistance has diminished significantly since September 2001.

It is not difficult to understand the historical resistance to implementing such a performance improvement program. Simply put, a program explicitly designed to improve human performance implies that human performance needs improving, an allegation that risks considerable political and institutional resistance. Not only does performance improvement imply that the system is not optimal, the necessary scrutiny of practice and performance would require examining sources and methods in detail throughout the Intelligence Community. Although this scrutiny would be wholly internal to the community, the concept runs counter to a culture of secrecy and compartmentalization.

The conflict between secrecy, a necessary condition for intelligence, and openness, a necessary condition for performance improvement, was a recurring theme I observed during this research. Any organization that requires secrecy to perform its duties will struggle with and often reject openness, even at the expense of efficacy. Despite this, and to their credit, a number of small groups within the Intelligence Community have tasked themselves with creating formal and informal ties with the nation's academic, non-profit, and industrial communities. In addition, there has been an appreciable increase in the use of alternative analyses and open-source materials.

These efforts alone may not be sufficient to alter the historical culture of secrecy, but they do reinforce the idea that the Intelligence Community itself has a responsibility to reconsider the relationship between secrecy, openness, and efficacy. This is especially true as it relates to the community's performance and the occurrence of errors and failure. External oversight and public debate will not solve these issues; the desire to improve the Intelligence Com-

[4] There are currently 109 active US astronauts and 36 management astronauts. See National Aeronautics and Space Administration-Johnson Space Center career astronaut biographies.

munity's performance needs to come from within. Once the determination has been found and the necessary policy guidelines put in place, it is incumbent upon the Intelligence Community to find and utilize the internal and external resources necessary to create a performance improvement infrastructure.

Scope

This project was designed explicitly as an applied research program. In many respects, it resembles an assessment of organizational needs and a gap analysis, in that it was intended to identify and describe conditions and variables that affect intelligence analysis and then to identify needs, specifications, and requirements for the development of tools, techniques, and procedures to reduce analytic error. Based on these findings, I was to make recommendations to improve analytic performance.

In previous human performance-related research conducted in the military, medical, and astronautic fields, I have found in place—especially in the military—a large social science literature, an elaborate training doctrine, and well-developed quantitative and qualitative research programs. In addition to research literature and programs, these three disciplines have substantial performance improvement programs. This was not the case with the Intelligence Community.

This is not to say that an intelligence literature does not exist but rather that the literature that does exist has been focused to a greater extent on case studies than on the actual process of intelligence analysis.[5] The vast majority of the available literature is about history, international relations, and political science. Texts that address analytic methodology do exist, and it is worth noting that there are quantitative studies, such as that by Robert Folker, that compare the effectiveness of different analytic methods for solving a given analytic problem. Folker's study demonstrates that objective, quantitative, and controlled research to determine the effectiveness of analytic methods is possible.[6]

The literature that deals with the process of intelligence analysis tends to be personal and idiosyncratic, reflecting an individualistic approach to problem solving. This is not surprising. The Intelligence Community is made up of a variety of disciplines, each with its own analytic methodology. The organizational assumption has been that, in a multidisciplinary environment, intelli-

[5] There are exceptions. See the appendix.

[6] MSgt. Robert D. Folker, *Intelligence Analysis in Theater Joint Intelligence Centers*. Folker's study contains a methodological flaw in that it does not describe one of the independent variables (intuitive method), leaving the dependent variable (test scores) in doubt.

gence analysts would use analytic methods and tools from their own domain in order to analyze and solve intelligence problems. When interdisciplinary problems have arisen, the organizational assumption has been that a variety of analytic methods would be employed, resulting in a "best fit" synthesis.

This individualistic approach to analysis has resulted in a great variety of analytic methods—I identified at least 160 in my research for this paper—but it has not led to the development of a standardized analytic doctrine. That is, there is no body of research across the Intelligence Community asserting that method X is the most effective method for solving case one and that method Y is the most effective method for solving case two.[7]

The utility of a standardized analytic doctrine is that it enables an organization to determine performance requirements, a standard level of institutional expertise, and individual performance metrics for the evaluation and development of new analytic methodologies.[8] Ultimately, without such an analytic baseline, one cannot assess the effectiveness of any new or proposed analytic method, tool, technology, reorganization, or intervention. Without standardized analytic doctrine, analysts are left to the rather slow and tedious process of trial and error throughout their careers.

Generally, in research literature, one finds a taxonomy, or matrix, of the variables that affect the object under study. Taxonomies help to standardize definitions and inform future research by establishing a research "road map." They point out areas of interest and research priorities and help researchers place their own research programs in context. In my search of the intelligence literature, I found no taxonomy of the variables that affect intelligence analysis.

Following the literature review, I undertook to develop working definitions and a taxonomy in order to systematize the research process. Readers will find the working definitions in the first chapter. The second chapter highlights the the broader findings and implications of this ethnographic study. Because the first two chapters contain many quotes from my interviews and workshops, they illustrate the tone and nature of the post-9/11 environment in which I worked.

The taxonomy that grew out of this work was first described in an article for the CSI journal, *Studies in Intelligence,* and is presented here as Chapter

---

[7] There is no single Intelligence Community basic analytic training program. There is, however, community use of advanced analytic courses at both the CIA University and the Joint Military Intelligence College. The Generic Intelligence Training Initiative is a recent attempt to standardize certain law enforcement intelligence analysis training programs through a basic law enforcement analyst training curriculum. The program has been developed by the Training Advisory Council, under the Counterdrug Intelligence Coordinating Group and the Justice Training Center.

[8] See the appendix.

Three. In addition to the normal journal review process, I circulated a draft of the taxonomy among 55 academics and intelligence professionals and incorporated their suggestions in a revised version that went to press. This is not to assert that the taxonomy is final; the utility of any taxonomy is that it can be revised and expanded as new research findings become available. The chapter by Dr. Judith Meister Johnston that follows offers an alternative model—more complex and possibly more accurate than the traditional intelligence cycle—for looking at the dynamics of the intelligence process, in effect the interrelationships of many elements of the taxonomy

The following chapters, prepared by me and other able colleagues, were developed around other variables in the taxonomy and offer suggestions for improvement in those specific areas. One of them—Chapter Five, on integrating methodologists and substantive experts in research teams—also appeared in *Studies in Intelligence*. Chapter Nine contains several broad recommendations, including suggestions for further research.

To the extent possible, I tried to avoid using professional jargon. Even so, the reader will still find a number of specific technical terms, and, in those cases, I have included their disciplinary definitions as footnotes.

A Work in Progress

In some respects, it may seem strange or unusual to have an anthropologist perform this type of work rather than an industrial/organizational psychologist or some other specialist in professional performance improvement or business processes. The common perception of cultural anthropology is one of fieldwork among indigenous peoples. Much has changed during the past 40 years, however. Today, there are many practitioners and professional associations devoted to the application of anthropology and its field methods to practical problem-solving in modern or postindustrial society.[9]

It is difficult for any modern anthropological study to escape the legacy of Margaret Mead. She looms as large over 20th century anthropology as does Sherman Kent over the intelligence profession. Although Franz Boas is arguably the father of American anthropology and was Margaret Mead's mentor, hers is the name everyone recognizes and connects to ethnography.[10] Chances are, if one has read anthropological texts, one has read Mead.

---

[9] The Society for Applied Anthropology and the National Association for the Practice of Anthropology section of the American Anthropological Association are the two principal anthropological groups. Another group is the Inter-University Seminar on Armed Forces and Society, a professional organization representing 700 social science fellows, including practicing anthropologists, applying their research methods to issues in the military.

I mention Mead not only because my work draws heavily on hers, but also because of her impact on the discipline and its direction. She moved from traditional cultural anthropological fieldwork in the South Pacific to problem-oriented applied anthropology during World War II. She was the founder of the Institute for Intercultural Studies and a major contributor to the Cold War RAND series that attempted to describe the Soviet character. She also pioneered many of the research methods that are used in applied anthropology today. I mention her work also as an illustrative point. After two years of field research in the South Pacific, she wrote at least five books and could possibly have written more.

As I look over the stacks of documentation for this study, it occurs to me that, given the various constraints of the fellowship, there is more material here than I will be able to address in any one text. There are the notes from 489 interviews, direct observations, participant observations, and focus groups; there are personal letters, e-mail exchanges, and archival material; and there are my own notes tracking the progress of the work. Moreover, the fieldwork continues. As I write this, I am scheduling more interviews, more observations, and yet more fieldwork.

This text, then, is more a progress report than a final report in any traditional sense. It reflects findings and recommendations to date and is in no way comprehensive. Finally, based as it is on my own research interests and research opportunities, it is but one piece of a much larger puzzle.

[10] Boas (1858–1942) developed the linguistic and cultural components of ethnology. His most notable work was *Race, Language, and Culture* (1940).

CHAPTER ONE

Definitions

Because I conducted human performance–related fieldwork before I came to this project, I carried into it a certain amount of experiential bias, or "cognitive baggage." The research findings from those other studies could bias my perspective and research approach within the Intelligence Community. For example, surgeons and astronauts do not need to deal with intentionally deceptive data. Patients are not trying to "hide" their illnesses from surgeons, and spacecraft are not thinking adversaries intent on denying astronauts critical pieces of information. This one difference may mean that intelligence analysis is much more cognitively challenging than the other two cases and that the requisite psychomotor skills are significantly less important. In an effort to counteract the biases of experience, I will attempt to be explicit about my own definitions in this work.

Working Definitions

The three main definitions used in this work do not necessarily represent definitions derived from the whole of the intelligence literature. Although some of the definitions used in this work are based on the Q-sort survey of the intelligence literature described later, some are based on the 489 interviews, focus groups, and two years of direct and participant observations collected during this project.

Definition 1: Intelligence is secret state or group activity to understand or influence foreign or domestic entities.

The above definition of *intelligence*, as used in this text, is a slightly modified version of the one that appeared in Michael Warner's work in a recent article in *Studies In Intelligence*.[1] Warner reviews and synthesizes a number of previous attempts to define the discipline of intelligence and comes to the conclusion that "*Intelligence is secret state activity to understand or influence foreign entities*."

Warner's synthesis seems to focus on strategic intelligence, but it is also logically similar to actionable intelligence (both tactical and operational) designed to influence the cognition or behavior of an adversary.[2] This synthesis captures most of the elements of actionable intelligence without being too restrictive or too open-ended, and those I asked to define the word found its elements, in one form or another, to be generally acceptable. The modified version proposed here is based on Warner's definition and the interview and observation data collected among the law enforcement elements of the intelligence agencies. These elements confront adversaries who are not nation states or who may not be foreign entities. With this in mind, I chose to define intelligence somewhat more broadly, to include nonstate actors and domestic intelligence activities performed within the United States.

Definition 2: Intelligence analysis is the application of individual and collective cognitive methods to weigh data and test hypotheses within a secret socio-cultural context.

This meaning of *intelligence analysis* was harder to establish, and readers will find a more comprehensive review in the following chapter on developing an intelligence taxonomy. In short, the literature tends to divide intelligence analysis into "how-to" tools and techniques or cognitive processes. This is not to say that these items are mutually exclusive; many authors see the tools and techniques of analysis as cognitive processes in themselves and are reluctant to place them in different categories. Some authors tend to perceive intelligence analysis as essentially an individual cognitive process or processes.[3]

My work during this study convinced me of the importance of making explicit something that is not well described in the literature, namely, the very

[2] US Joint Forces Command, *Department of Defense Dictionary of Military and Associated Terms*.

[3] The appendix lists literature devoted to each of these areas.

interactive, dynamic, and social nature of intelligence analysis. The interview participants were not asked to define intelligence analysis as such; rather, they were asked to describe and explain the process they used to perform analysis. The interview data were then triangulated with the direct and participant observation data collected during this study.[4]

Despite the seemingly private and psychological nature of analysis as defined in the literature, what I found was a great deal of informal, yet purposeful collaboration during which individuals began to make sense of raw data by negotiating meaning among the historical record, their peers, and their supervisors. Here, from the interviews, is a typical description of the analytic process:

> *When a request comes in from a consumer to answer some question, the first thing I do is to read up on the analytic line. [I] check the previous publications and the data. Then, I read through the question again and find where there are links to previous products. When I think I have an answer, I get together with my group and ask them what they think. We talk about it for a while and come to some consensus on its meaning and the best way to answer the consumer's question. I write it up, pass it around here, and send it out for review.*[5]

The cognitive element of this basic description, "when I think I have an answer," is a vague impression of the psychological processes that occur during analysis. The elements that are not vague are the historical, organizational, and social elements of analysis. The analyst checks the previous written products that have been given to consumers in the past. That is, the analyst looks for the accepted organizational response before generating analytic hypotheses.

The organizational-historical context is critical to understanding the meaning, context, and process of intelligence analysis. There are real organizational and political consequences associated with changing official analytic findings and releasing them to consumers. The organizational consequences are associated with challenging other domain experts (including peers and supervisors). The potential political consequences arise when consumers begin to question the veracity and consistency of current or previous intelligence reporting. Accurate or not, there is a general impression within the analytic community

---

[4] In research, triangulation refers to the application of a combination of two or more theories, data sources, methods, or investigators to develop a single construct in a study of a single phenomenon.

[5] Intelligence analyst's comment during an ethnographic interview. Such quotes are indented and italicized in this way throughout the text and will not be further identified; quotes attributable to others will be identified as such.

that consumers of intelligence products require a static "final say" on a given topic in order to generate policy. This sort of organizational-historical context, coupled with the impression that consumers must have a final verdict, tends to create and reinforce a risk-averse culture.

Once the organizational context for answering any given question is understood, the analyst begins to consider raw data specific to answering the new question. In so doing, the analyst runs the risk of confirmation biases. That is, instead of generating new hypotheses based solely on raw data and then weighing the evidence to confirm or refute those hypotheses, the analyst begins looking for evidence to confirm the existing hypothesis, which came from previous intelligence products or was inferred during interactions with colleagues. The process is reinforced socially as the analyst discusses a new finding with group members and superiors, often the very people who collaborated in producing the previous intelligence products. Similarly, those who review the product may have been the reviewers who passed on the analyst's previous efforts.

This is not to say that the existing intelligence products are necessarily inaccurate. In fact, they are very often accurate. This is merely meant to point out that risk aversion, organizational-historical context, and socialization are all part of the analytic process. One cannot separate the cognitive aspects of intelligence analysis from its cultural context.

Definition 3: Intelligence errors are factual inaccuracies in analysis resulting from poor or missing data; intelligence failure is systemic organizational surprise resulting from incorrect, missing, discarded, or inadequate hypotheses.

During interviews, participants were asked to explain their understanding of the terms *intelligence error* and *intelligence failure*. There was little consensus regarding the definitions of error and failure within the Intelligence Community or within the larger interview sample. Here are some sample responses:

I don't know what they mean.

There are no such things. There's only policy failure.

You report what you know, and, if you don't know something, then it isn't error or failure. It's just missing information.

Failure is forecasting the wrong thing.

Failure is reporting the wrong thing.

Error is forecasting the wrong thing.

Error is reporting the wrong thing.

A failure is something catastrophic, and an error is just a mistake.

Error is about facts; failure is about surprise.

Error is when nobody notices, and failure is when everybody notices.

Some responses disavowed the existence of intelligence error and failure; some placed the terms in the broader context of policy and decisionmaking; some interchanged the two terms at random; some defined the terms according to their outcomes or consequences. Despite the variability of the responses, two trends emerged: novice analysts tended to worry about being factually inaccurate; senior analysts, managers, and consumers, tended to worry about being surprised. Often, participants' responses were not definitions at all but statements meant to represent familiar historical examples:

The attack on Pearl Harbor.

The Chinese sending combat troops into Korea.

The Tet Offensive.

The Soviet invasion of Afghanistan.

The collapse of the Soviet Union.

The Indian nuclear test.

September Eleventh.

The danger of defining by example is that each case is contextually unique and can be argued ad infinitum. What is important about these examples as a whole is that they all indicate one central and recurring theme. Specifically, all these examples signify surprise—in some cases, intelligence surprise; in other cases, military, civil, and political surprise. Even if the Intelligence Community itself was not surprised by one of these events, it was unable to convince the military, civil, and political consumers of intelligence that these events might occur; in which case, the failure was one of communication and persuasion.

When I began this study, my own definition of error and failure derived from the psychological and cognitive disciplines. Specifically, I took it that human error and failure are related to measures of cognitive and psychomotor accuracy, commission of error being at one end of the accuracy scale and omission or not performing the correct action being at the other.[6]

[6] See Appendix A for a list of literature on error.

During the interviews for this study, I soon found that the psychological definition was insufficient. The psychological definition took into account the cognitive and psychomotor components of task-structure, time-to-task, and accuracy-of-task as measures of errors and error rates, but it did not fully take into account the notion of surprise.[7] Surprise is the occurrence of something unexpected or unanticipated. It is not precisely commission or omission; it indicates, rather, the absence of contravening cognitive processes. Measures of accuracy may account for factual errors in the intelligence domain, but measures of accuracy are insufficient to account for surprise events and intelligence failure.

To put this in context, an analyst, while accounting successfully for an adversary's capability, may misjudge that adversary's intention, not because of what is cognitively available, but because of what is cognitively absent. The failure to determine an adversary's intention may simply be the result of missing information or, just as likely, it may be the result of missing hypotheses or mental models about an adversary's potential behavior.

[7] Sociological definitions are more akin to the definitions proposed in this study. Failure can occur due to system complexity and missing data as well as through the accumulation of error. See Charles Perrow, *Normal Accidents. Living with High Risk Technologies*. I'd like to thank Dr. Perrow for his assistance with this work.

CHAPTER TWO

Findings

Scientific knowledge, like language, is intrinsically the common property of a group or else nothing at all. To understand it we shall need to know the special characteristics of the groups that create and use it.

Thomas Kuhn[1]

The more we learn about the world, and the deeper our learning, the more conscious, specific, and articulate will be our knowledge of what we do not know.

Karl Popper[2]

The purpose of this research was to identify and describe conditions and variables that negatively affect intelligence analysis, to develop relevant and testable theory based on these findings, and to identify areas in which strategies to improve performance may be effective. Although there has recently been a great deal of concern that intelligence error and failure rates are inordinately high, in all likelihood, these rates are similar to those of other complex socio-cognitive domains, such as analysis of financial markets. The significant differences are that other complex domains employ systematic performance

[1] Philosopher of science Thomas Kuhn described the now-common concept of paradigm shifts in scientific revolutions. He posited that paradigm shifts are tied to cultural and social constructionist models, such as Vygotsky's (See footnote 22 in Chapter Three). Thomas Kuhn, *The Structure of Scientific Revolutions*.

[2] Karl Popper was one of the 20th century's pre-eminent philosophers of science. Karl Popper, *Conjectures and Refutations: The Growth of Scientific Knowledge*.

improvement infrastructures and that the consequences of intelligence error and failure are disproportionately high in comparison with other domains.

It is evident from the literature that intelligence organizations recognize the need to improve their performance and that it is possible to make the domain of intelligence analysis into a coherent scientific discipline. The first step in this transition is to identify and describe performance gaps.[3] Once gaps have been identified, it will be possible to introduce performance improvement methods systematically and to measure the effectiveness of the results. This work is intended to further research toward creating intelligence organizations that are more effective.

The Problem of Bias

Although a researcher might pretend to be neutral and unbiased in presenting his findings and conclusions, personal biases can creep into a finished product. The methods ethnographers employ to collect raw data and the use of interpretational analysis to extract meaning and generate theory virtually guarantee it. In my view, one should be candid about this possibility. I noted in Chapter One that ethnographers bring a certain amount of experiential baggage to their work, myself included. At this point, before discussing analytical difficulties and problems I identified during my research, I want to make the readers aware of an additional personal bias that has developed from observing the Intelligence Community.

During my research, I developed a great deal of empathy for individual analysts and the problems they face in trying to perform their jobs. The reason for this is straightforward and something every anthropologist recognizes. It is part of the process that anthropologists reach a point where they can modify their own identity in order to gain insight into a different culture. The risk is that empathy and identity modification will induce the researcher to "go native" and produce bias in his findings.

Although I may empathize with analysts personally, it is critical for theory development to avoid parroting the views, kudos, or complaints of individual analysts, who may or may not be dissatisfied with their unique professional experience. In order to counteract the empathy bias, I employed multiple data collection techniques and then used those data to refute or confirm each categorical finding. Triangulation is not an infallible system, however, and the reader is advised to approach these findings with both a critical eye and the

[3] Performance gaps are the difference or distance between ideal (perfect) organizational performance and actual organizational performance. In this case, ideal performance includes complete data sets, reportorial accuracy, and the ability to avoid strategic, operational, and tactical surprise.

foreknowledge that this researcher has a number of personal and professional biases.[4]

Finding: Secrecy Versus Efficacy

Secrecy and efficacy conflict. Secrecy interferes with analytic effectiveness by limiting access to information and sources that may be necessary for accurate or predictive analysis. In turn, openness interferes with security by degrading the value of information resources and by revealing specific sources and methods.

Perfect secrecy would ultimately be unproductive, because it would restrict information to one mind or to a very small group of minds. Limiting available resources in this way would produce organizational failure in competition with resources available to a large and diverse group of adversaries. Perfect openness would also lead to organizational failure, because, with full access to all information, there would never be an instance of advantage for any one group over any other group. In addition, perfect openness would result in adversaries being aware they are under observation and could lead them to alter their behavior to deceive the observer if they so desired.[5]

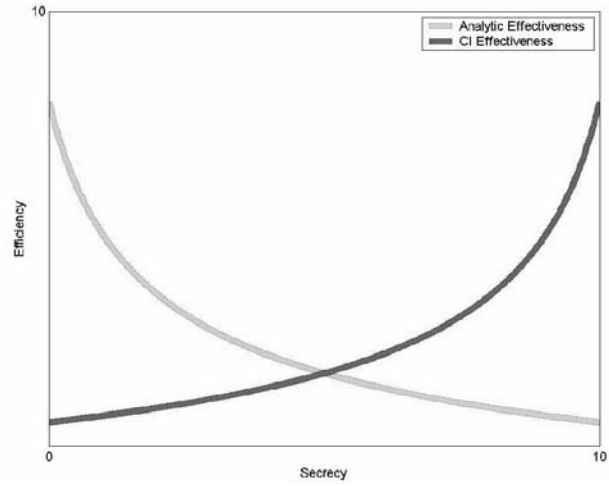
Between these two extremes, there is some notional point where secrecy and openness converge to create an optimal performance tradeoff. My perception is that, within the Intelligence Community, more organizational emphasis is placed on secrecy than on effectiveness. It is important, in my view, that there be a voice in favor of openness to counterbalance the many voices whose sole or primary responsibility is the advocacy and maintenance of

---

[4] Throughout the project, my data collection method consisted of written field notes. Anthropologists traditionally include specific detail from participant input or direct observation. Usually, this is in the form of precise descriptions of the actual behavior of participants and transcripts of their verbal interactions. It is also standard practice in field work to capture these data, and the data from the interviews and focus groups, on audio- or videotape. These practices were not followed in this particular case for two reasons: first, the nature of my work was not to document actual practices and procedures; rather, it was to derive categories of variables and individual variables in order to create a taxonomy, and to use the prototype taxonomy to structure the interactions; second, the nature of intelligence work and the environment in which it occurs, as well as its professional practitioners, require that certain data be restricted.

[5] This has been demonstrated in the psychological literature and is referred to as the Hawthorne Effect. Derived from research that began with an experimental program at Western Electric's Hawthorne Works conducted between 1927 and 1930, the Hawthorne Theory, broadly interpreted, states that the behavior of subjects changes when they are aware of being observed. See Fritz J. Roethlisberger and William J. Dickson, *Management and the worker*; Elton Mayo, *The Human Problems of an Industrial Civilization*.

Secrecy vs. Efficacy



secrecy. I believe this secrecy-efficacy conflict can be stated as a theory, along the following lines.[6]

The more open the system (where zero is perfect information access and sharing on the X axis secrecy scale [as shown on the above graph]), the more access an analyst has to all sources of information within the Intelligence Community regarding an adversary. In addition, this openness encourages interorganizational communication, interaction, and sharing of information among analysts and increases the likelihood that an analyst will be more efficient (in this case the Y axis efficiency scale) and therefore effective or accurate in his or her assessment of a situation.

Conversely, counter-intelligence is negatively affected by zero-level secrecy and perfect openness. The less open or more compartmentalized the system, the more efficient and effective are counterintelligence activities. Notionally, the two curves would meet somewhere in the tradeoff between efficiency and secrecy. Where they meet would depend on program goals and a clear definition of starting points and end-states.

The notional set of curves above illustrates the tradeoff between system efficiency and system secrecy and the effect that the tradeoff has on performance effectiveness, both positive and negative. In this case, the starting and ending points of effectiveness for analysis and for counterintelligence are arbitrary and could be positioned anywhere along a continuum between zero

[6] I would like to credit and thank Matthew Johnson at the Institute for Defense Analyses for his help in formulating this theory.

and ten. In this theory, analytic efficiency and effectiveness are purely functions of system openness and do not take into account analytic methods or personnel.

This theory will require additional refinement, and it may or may not be represented by a tradeoff curve like the one proposed here. The theory will also require numerous controlled quantitative experiments to test its explanatory power.

Finding: Time Constraints

> *The work itself is a 24-hour-a-day job, but it never seems like I have any time to actually analyze anything when I'm at my desk. I spend most of my time reading daily traffic, answering e-mail, coordinating papers with everybody, and writing. Mostly I read and write, but when the workday is over, I go home and think. It isn't like I can turn off my brain. So, I guess I do most of my real analysis on my own time.*

The majority of the analysts interviewed indicated that time was one of their greatest constraints at work. This comment triangulated with the findings from direct and participant observation. In addition, analysts indicated that there has been a communitywide shift toward focusing on short-term issues or problem solving, thereby addressing the immediate needs of intelligence consumers. This shift in product focus, coupled with a growth in available all-source raw intelligence, has resulted in a change in the pace of analytic production. In order to generate the daily products, analysts have had to change the way they go about doing their work.

> *I haven't been doing this very long, but I wish I had been a journalism major instead of poli-sci. The pace is excruciating.*
>
> *I don't get much sleep. It's like cramming for finals, except we do it every day.*
>
> *Everything I do is reactive. I don't have time to work my subject. We're not pro-active here.*
>
> *I'm so busy putting out today's fires, I don't have any time to think about what kind of catastrophe is in store for me a month from now.*
>
> *About 15 years ago, I used to have 60 percent of my time available for long-term products. Now, it's between 20 and 25 percent.*
>
> *I probably have about 30 percent of my time for self-initiated products.*

You know, someday somebody is bound to notice that velocity isn't a substitute for quality. We've gotten rid of the real analytic products that we use to make, and now we just report on current events.

Not all analysts indicated that time constraints and information load had a negative effect on their performance. A minority indicated that there was sufficient time to perform analytic duties and prepare analytic products.

This is a tactical shop. It's all we do. Current reporting is our job.

I work a slow desk. I have plenty of time for self-initiated products—maybe 60 percent or more.

I multitask pretty well. I don't really experience a time-crunch.

Maybe I just process better than other people, but I don't really feel pressed for time. Besides, I'd rather be at a hot desk than at a cold desk.

Analytic supervisors were more evenly mixed in their opinions about time constraints. A slight majority of the managers interviewed said time constraints had negative effects on the work environment, work processes, and the morale of their staff. A majority of them also put analytic time constraints in a larger context of policy making. They indicated that the decision-cycle of policymakers was 24 hours a day and that their responsibility was to support that decision cycle with current intelligence.

In discussing their perceptions of consumer demand, the managers' views of the nature of those demands were mixed.

I want my analysts to produce long-term products. I want them thinking through their subjects. The decision makers want well-thought-out products, not just daily briefs.

Our customers want current production. They never complain about the daily products and, frankly, I doubt they have time to read the longer stuff.

My consumers like the bigger pieces. They like having the context and broader picture. They don't want to be spoon fed.

I've never had a customer tell me they want more to read.

Our customers want to avoid surprise. As long as we keep them from being surprised, I don't care if we do daily or long-term production. I don't think they care either.

Finding: Focus on Current Production

The present daily production cycle and the focus on current intelligence also affect group interactions and the analytic process.

Group Interactions:

It doesn't matter if I'm writing a piece myself or if I'm coordinating a piece with some group. We don't sit around and test hypotheses, because we're too busy writing. We've got serious deadlines here.

If, by group analysis, you mean the senior expert in the room tells everybody what he thinks, and then we generally agree so that we can get back to our own deadlines, then, sure, there's a group process.

We used to have groups that did current reporting and different groups that did longer term products. We still have some of that, but it is very limited. I couldn't say what happened exactly, but we're all doing current production now.

The Analytic Process:

People seem to have confused writing with analyzing. They figure that if you just go through the mechanics of writing something, then you must have analyzed it. I don't know about everybody else, but it doesn't work that way for me. I need time to think through the problem.

Our products have become so specific, so tactical even, that our thinking has become tactical. We're losing our strategic edge, because we're so focused on today's issues.

Alternative analysis is a nice concept, but I don't have the time to do it. I've got to keep up with the daily traffic.

I use several analytic techniques that are relatively fast. Scenario development, red teams, competing hypotheses, they're all too time consuming.

We've got Bayesian tools, simulations, all kinds of advanced methods, but when am I supposed to do any of that? It takes all my time to keep up with the daily reporting as it is.

I don't have time to worry about formal analytic methods. I've got my own system. It's more intuitive and a lot faster.

Finding: Rewards and Incentives

The shift in the analytic production cycle is not only reflected in the products and processes but also in the way analysts perceive the system by which intelligence organizations reward and promote employees. Employees see their opportunities for promotion as being tied directly to the number of daily products they generate and the amount of social capital or direct consumer influence they amass, most often when their work is recognized by senior policymakers.[7]

> *In any given week, I could devote about 20 percent of my time to longer think pieces, but why should I? You can write all the think pieces you want, but, if you don't write for the daily briefs, you aren't going to move into management. These days the only thing that matters is getting to the customers.*
>
> *If I write a 12-page self-directed piece that goes out as a community product, and somebody else writes one paragraph with two bullet points that goes into a daily brief, the guy who got in the daily brief is going to get the recognition. Why waste my time with the big products?*
>
> *It isn't really official policy, but the reality is that sheer production equals promotion. People talk about quality, but, in the end, the only measurable thing is quantity.*
>
> *Our group has a "team award" of 5,000 bucks. Last year, they gave it to the one guy who published the most. I'm not sure how that one guy won a "team award," but there you go.*
>
> *Technically, I have four bosses. The only thing that seems to keep them all happy is volume. It's like piece work.*
>
> *Quality? How do you measure quality? Quantity—now that's something you can count.*
>
> *Promotion is based on production—pure and simple.*

In sum, aside from specific tactical groups, staff positions that generate limited social capital, and individual cognitive differences, there is a majority sentiment among the analysts interviewed that the combination of a shorter

---

[7] Social capital refers to the set of norms, social networks, and organizations through which people gain access to power, resources, and reciprocity and through which decisionmaking and policy creation occur. In other words, whom you know is just as important as what you know. Pierre Bourdieu, "The Forms of Capital"; Robert Putnam, "The Prosperous Community" and *Bowling Alone*. See also the empirical work on social capital summarized in Tine Feldman and Susan Assaf, *Social Capital: Conceptual Frameworks and Empirical Evidence.*

production cycle, information load, a shift in product focus, and organizational norms regarding promotion have had an impact on analytic work and intelligence analysis itself.

Finding: "Tradecraft" Versus Scientific Methodology

> *Human beings do not live in the objective world alone, nor alone in the world of social activity as ordinarily understood, but are very much at the mercy of the particular language which has become the medium of expression for their society…The fact of the matter is that the "real world" is to a large extent unconsciously built upon the language habits of the group…We see and hear and otherwise experience very largely as we do because the language habits of our community predispose certain choices of interpretation.*
>
> Edward Sapir[8]

The Intelligence Community, in its culture and mythos and in its literature, tends to focus on intelligence *operations* rather than on intelligence *analysis*. Open literature about the community certainly does so. Along with time constraints and the analytic production cycle, the private and public focus on operations has had an effect on intelligence analysts and analytic methodology. The principal effect is the spread of the concept of **"**tradecraft**"** within the analytic community.

Community members quite often used the word "tradecraft" to describe intelligence analysis during the interviews, observations, training programs, workshops, and actual analytic tasks that I performed for this study. Analysts, managers, instructors, and academic researchers employed the word "tradecraft" as a catchall for the often-idiosyncratic methods and techniques required to perform analysis. Although the intelligence literature often refers to tradecraft, the works tend to be a collection of suggestions and tips for writing and communicating with co-workers, supervisors, and consumers instead of focusing on a thorough examination of the analytic process and techniques.

The notion that intelligence operations involve tradecraft, which I define as *practiced skill in a trade or art*, may be appropriate, but the analytic community's adoption of the concept to describe analysis and analytic methods is not. The obvious logical flaw with adopting the idea of tradecraft as a standard of practice for analytic methodology is that, ultimately, analysis is neither craft nor art. Analysis**,** I contend**,** is part of a *scientific* process. This is an important

[8] Edward Sapir is best known for the Sapir-Whorf hypothesis, which asserts linguistic/cognitive relativity (language and thought are inseparable; therefore, different languages mean different ways of thinking). Edward Sapir, *Language*.

distinction, for language is a key variable in anthropology and often reveals a great deal about the cognition and culture of a community of interest.[9]

The adoption by members of the analytic community of an inappropriate term for the processes and methods employed in their professional lives obfuscates and complicates the reality of their work. The adoption of the word "tradecraft" demonstrates the analytic community's need to create a professional identity separate and unique from other disciplines but tied directly to the perceived prestige and cachet of intelligence operations. Adopting "tradecraft" as a term of reference for explaining work practices and as a professional identity marker may seem trivial. Yet the term, and its effect on the community, has unanticipated consequences.

Tradecraft purposefully implies a mysterious process learned only by the initiated and acquired only through the elaborate rituals of professional indoctrination. It also implies that the methods and techniques of analysis are informal, idiosyncratic, unverifiable, and perhaps even unexplainable. "Good" methods are simply those that survive, and then are passed on by "good" analysts to novice analysts. Unfortunately, "good" in both instances is not an objective measure. That is, there is no formal system for measuring and tracking the validity or reliability of analytic methods, because they are both perceived and employed within the context of idiosyncratic tradecraft. When asked to describe the analytic process, analysts responded in a variety of ways.

> *First, I figure out what I know and what I don't know about some situation. Then, I look for information to fill the gap.*
>
> *I have a model of the situation in my head. Whenever something new comes in, I see if it fits with the model. If it does, I add it to the model; if it doesn't, I try to figure out why.*
>
> *I've found a system that lets me keep up. I just look for anomalies. When I see any novel data, then I worry.*
>
> *I'm always looking for anything strange or out of place. Then, I source it to see if it is meaningful.*
>
> *The current data ought to fit a certain pattern. If it doesn't, I know something is wrong.*
>
> *First, I print the daily traffic I'm concerned with; then I lay out all of the relevant stuff in front of me on my desk or the floor; then I start looking for threads.*

[9] The literature on this subject is extensive. For a representative list, see the appendix.

I'm looking for links and patterns. Once I figure out the pattern, I can figure out where to look next.

I use patterns. If things start happening, out of the ordinary things, I pay attention to them.

I try to build patterns out of the data. It helps me predict what will happen next.

I come up with a few scenarios and see what the evidence supports.

I look for data that are diagnostic: some piece of evidence that rules out certain possibilities.

I try to weigh the evidence to see which scenario it supports.

Although anomaly-detection, pattern-recognition, and weighing data may appear to be idiosyncratic tradecraft based on individual expertise and cognitive skills, these methods can be formalized and replicated if the operating parameters, variables, and rules of evidence are made explicit.[10] This is to say that intelligence analysis can be reconstructed in the context of a scientific method, which is merely an articulated, formal process by which scientists, collectively and over time, endeavor to put together a reliable, consistent, and nonarbitrary representation of some phenomena. Broadly, the steps include:

- observation and description of phenomena;
- formulation of hypotheses to explain phenomena;
- testing of hypotheses by independent experts;
- refutation or confirmation of hypotheses.

These steps do not suggest that any specific scientific methodology results in what is ultimately the truth, rather that scientific methods are merely formal processes used to describe phenomena, make predictions, and determine which hypothesis best explains those phenomena. The principal value of any type of methodological formalism is that it allows other researchers to test the validity and reliability of the findings of any other researcher by making explicit, and therefore replicable, the means by which anyone reaches a specific conclusion.[11]

The idea that intelligence analysis is a collection of scientific methods encounters some resistance in the Intelligence Community. The interview data analyzed in this study highlight many subtle—and not so subtle—prejudices

[10] A corollary to these methods can be found in the practice of radiologists. See Chapter Five for more on expertise.

that analysis is not a science. That is, it is an art or craft in which one can attain skill but not a formal discipline with tested and validated methodology.

> *What we do is more art and experience than anything else.*
>
> *Science is too formal. We can't actually run experiments here.*
>
> *How would you actually test a hypothesis in intelligence?*
>
> *Science is what you do in a lab.*
>
> *We're not scientists; we're analysts. We don't generate the data.*
>
> *We don't worry too much about theory; we worry about the facts.*
>
> *In my discipline, I might be a scientist, but, in intelligence, I am a practitioner.*
>
> *I use science for my area, but I don't think intelligence analysis is science.*

As long as intelligence analysis continues to be tradecraft, it will remain a mystery. The quality of any tradecraft depends on the innate cognitive capabilities of the individual and the good fortune one has in finding a mentor who has discovered, through many years of trial and error, unique methods that seem to be effective. This process of trial and error is, in general, similar to any scientific process, except that the lessons learned in tradecraft, unlike those of other disciplines, often occur without being captured, tested, or validated.

In an oral tradition, individual tradecraft methods are passed on by means of apprenticeship. The consequence for any culture tied to an oral tradition is the loss of important knowledge that occurs with the loss of practitioners. In organizations, the retirement of experts and innovators leads to the loss of that expertise and innovation, unless there is some formal written and educational system to keep that knowledge alive.[12]

The data collected through both interviews and observation indicated that there were, in fact, general methods that could be formalized and that this process would then lead to the development of intelligence analysis as a scientific discipline. The principal difficulty lies not in developing the methods them-

---

[11] Rather than engage in the longstanding and ongoing debate in the academic community about what is and what is not science or a scientific method, suffice it to say that any scientific method needs to be explicit, replicable, and refutable. The literature surrounding this debate is voluminous. The philosophy of science, logic, language, and epistemology has taken this debate in a number of directions. There is, however, a general theme that replication is a key ingredient to any scientific method.

[12] See section on Endangered Languages in Barbara Grimes, ed., *Ethnologue*. 14th ed.

selves, but in articulating those methods for the purpose of testing and validating them and then testing their effectiveness throughout the community. In the long view, developing the science of intelligence analysis is easy; what is difficult is changing the perception of the analytic practitioners and managers and, in turn, modifying the culture of tradecraft.

Finding: Confirmation Bias, Norms, and Taboos

> *Organization is key, because it sets up relationships among people through allocation and control of resources and rewards. It draws on tactical power to monopolize or parcel out liens and claims, to channel action into certain pathways while interdicting the flow of action into others. Some things become possible and likely; others are rendered unlikely.*
>
> Eric Wolf[13]

Time constraints affect both the general analytic production cycle and analytic methodology by contributing to and exacerbating cognitive biases. Although there are any number of cognitive biases to which the human mind is susceptible, one in particular became evident during the triangulation phase and interpretive analysis of the interview and observation data of this study. The cognitive bias identified most often was confirmation bias, which is the tendency of individuals to select evidence that supports rather than refutes a given hypothesis.[14]

Although the psychological mechanism by which confirmation bias occurs is in debate, confirmatory behavior is a consistent finding throughout the experimental psychology and cognitive science literature. Rather than focus on the mechanism and nomenclature, the term "confirmation bias" is used in this work as a description of confirmatory behavior. This behavior was

---

[13] Eric Wolf was an anthropologist who focused on power, social structures, and the third world. His work on power and the lives of peasants is considered a modern anthropological classic. Eric Wolf, *Pathways of Power.*

[14] There is a fair amount of disagreement in the psychological literature regarding the mechanism by which an individual displays confirmatory behavior. Some researchers attribute it to motivational factors, for example, a desire to maintain respect within a group. Other researchers attribute it to selectivity factors, an unconscious cognitive selection of data that confirms the current status quo. Some researchers attribute it to social factors, a subspecies of groupthink (see Irving Janis, *Groupthink*). Still others ascribe it to a misapplication of heuristics, whereby an individual learns a set of rules that solves one problem and then begins using that same set of rules to try to solve other types of problems. Although the literature is extensive, Karl Popper's *The Logic of Scientific Discovery* provides a foundation for understanding the issue. Jonathan Evans' *Bias in Human Reasoning: Causes and Consequences* is still a useful and concise summary of the research related to confirmation bias.

described by participants during the interviews and observed during direct and participant observations throughout the fieldwork.

Analysts were asked to describe the work processes they employed to answer questions, solve problems, describe and explain phenomena, make forecasts, and develop intelligence products. The process they described began with an examination of previous analytic products developed by their organization in order to establish a baseline from which they could build their own analysis.

> *When a request comes in from a consumer to answer some question, the first thing I do is to read up on the analytic line.*
>
> *The first thing I do is check the pervious publications, and then I sort through the current traffic.*
>
> *I've looked at our previous products, and I've got a good idea of the pattern; so, when I sort through the traffic, I know what I'm trying to find.*
>
> *I try to keep up with all the products that come out of our area, so I know where to start my piece.*

A literature search is often the first step in any research endeavor. The utility of this practice is not merely to define and understand the current state of research in the field but also to determine major controversies and divergences of opinion. Trying to discern controversies and divergence in intelligence products is often difficult, because some of them—national intelligence estimates (NIE), in particular—are specifically designed to produce a corporate consensus for an audience of high-level policymakers.

These products can and do include divergent opinions, in the form of footnotes, but these tend to indicate inter-, rather than intra-, organizational differences. Dissenting footnotes are products of the coordination process, the result of an inability on the part of one or several community organizations to convince the others of a particular point of view. Not surprisingly, the least probable opinion is often the hardest to defend, whereas the most probable opinion is the easiest to support.

The literature search approach may promote a logical consistency among analytic products, but it has the unintended consequence of imposing on the analyst using it a preexisting mental model of the phenomena in question. The existing analytic products describe, implicitly or explicitly, a set of working hypotheses that an analyst may wish to reflect in his or her own work. Of course, these existing hypotheses are rarely tested each time they are incorporated into new products. What tends to occur is that the analyst looks for current data that confirms the existing organizational opinion or the opinion that

seems most probable and, consequently, is easiest to support. As this strategy is also the most time-efficient technique, it reduces the time constraints associated with the daily production cycle.

This tendency to search for confirmatory data is not necessarily a conscious choice; rather, it is the result of accepting an existing set of hypotheses, developing a mental model based on previous corporate products, and then trying to augment that model with current data in order to support the existing hypotheses. Although motivational and heuristic factors and a tendency toward "groupthink" might contribute to confirmatory behavior in intelligence analysis, my observations and interviews during this study suggest that the predominant influence is selectivity bias in order to maintain a corporate judgment.

The maintenance of a corporate judgment is a pervasive and often-unstated norm in the Intelligence Community, and the taboo against changing the corporate product line contributes to confirmation biases. Once any intelligence agency has given its official opinion to policymakers, there exists a taboo about reversing or significantly changing the official or corporate position to avoid the loss of status, trust, or respect. Often, policymakers perceive a change in judgment as though the original opinion was wrong, and, although unstated, there are significant internal and external social pressures and consequences associated with being perceived as incorrect.

An analyst can change an opinion based on new information or by revisiting old information with a new hypothesis; in so doing, however, he or she perceives a loss of trust and respect among those with whom the original judgment was shared. Along with this perceived loss of trust, the analyst senses a loss of social capital, or power, within his or her group.[15]

It is even more difficult for an intelligence agency to change its official position once it has made its judgments known to those outside of the organization. There is a sense that changing the official product line will be seen outside of its context—the acquisition of new information, for instance—and that it will be perceived by the policymakers as an example of incompetence or, at least, of poor performance on the part of the intelligence agency.

This perception then carries with it the threat of a loss in status, funding, and access to policymakers, all of which would have a detrimental effect on the ability of the intelligence agency to perform its functions. In short, it serves the interest of the intelligence agency to be perceived as decisive

[15] Reciprocity in this case has to do with information, judgment, and trust. The classic anthropological text on social reciprocity and trust within and between groups is Marcel Mauss's *The Gift*. Originally published in 1950 and based in part on the work of his uncle and mentor, Emile Durkheim, Mauss's work (*Essai sur le Don* in its French version) lays the foundation for his contention that reciprocity is the key to understanding the modern concept of social capital.

instead of academic and contradictory, and that message is transmitted to the analysts. In response to the organizational norm, the analyst is inclined to work the product line rather than change it.

> *Our products are company products, not individual products. When you publish something here, it's the official voice. It's important for us to speak with one voice.*
>
> *It doesn't do us any good if people think we can't make up our mind.*
>
> *Access matters; if people think you don't know what you're talking about, then they stop seeing you.*
>
> *We already briefed one thing. I can't go in there and change it now. We'll look like idiots.*
>
> *When I was new, I wrote a piece that disagreed with our line. Let's just say, I'm more careful about that now.*

Another organizational norm that contributes to confirmation bias in the Intelligence Community is the selection and weighing of data according to classification. Secrets carry the imprimatur of the organization and, in turn, have more face validity than information collected through open sources.[16]

Most analysts indicated that they considered "secret" data collected by covert means to be more important or meaningful than "open" or unclassified data. Analysts said that they rely on open sources to help fill in missing pieces of their mental models but that they test the model's validity with secret information. Choosing to rely on classified data as more meaningful to problem solving and as a tool for testing the validity of their hypotheses serves to exacerbate the confirmation bias.

> *I'm an all-source analyst, so I use whatever I can get my hands on; but, if the traffic comes from operations, I tend to pay more attention to it than to information in the open literature.*
>
> *There is something special about the word "secret" in my business. It says that it must be important because people had to go and get it rather than its just showing up in the news. We tend to weigh classified material as more important than other sources.*

---

[16] In research methodology, face validity is the concept that a measurement instrument *appears* or *seems* to measure what it is actually intended to measure and requires no theoretical supporting material. In contrast, content validity depends on the content of the domain and established theories to determine its measures of validity. See David Brinberg and Joseph McGrath, *Validity and the Research Process*; Edward Carmines and Richard Zeller, *Reliability and Validity Assessment*; Jerome Kirk and Marc Miller, *Reliability and Validity in Qualitative Research*; Mark Litwin, "How to measure survey reliability and validity"; William Trochim, *The Research Methods Knowledge Base*.

We get all kinds of sourced material, but I think I trust technical collection more than the other INTs.

I try to use everything we get, but, if we are jammed, I rely on sources we collect.

Our value-added is classified sourcing. Everybody has access to the Web and CNN.

All our customers are analysts these days. What we bring to the party is information no one else has.

We're in the business of secrets. If you see that stamped on something, it must be there for a reason.

The over reliance on classified information for hypothesis testing creates a situation in which the data are screened and sorted by the organization before they are selected and tested by the analysts. Classified information comes from very specific types of technical and human sources, and it is filtered through very specific reporting channels. It also has a tendency to become homogeneous because of the source types and reporting mechanisms. Because it is generated and packaged in specific formats using specific processes, classified information lacks the diversity that is inherent in open information, and this contributes to confirmation bias.

In sum, operating under difficult time constraints, trying to make new work accord with previous products, trying to maintain the prestige and power of the organization, and assigning greater weight to secret information than to open information have a cumulative effect, and the analyst often finds himself or herself trying to produce daily products using the most time-efficient strategies available instead of generating or testing hypotheses by way of refutation.

The persistence of the notion of tradecraft, coupled with organizational norms, promotes the use of disjointed analytic strategies by separating intelligence analysts from other scientific disciplines. These conditions have had an effect on the self-concept of analysts and have molded the way analysts perceive their own identity.

Finding: Analytic Identity

The self is something which has a development; it is not initially there, at birth, but arises in the process of social experience and activity, that is, develops in the given individual as a result of his relations to that process as a whole and to other individuals within that process.

George Mead.[17]

Asked to define their profession, the majority of analysts described the process of analysis rather than the actual profession. The question, "What is an intelligence analyst?" resulted most often in a description of the work day and of the production cycle of analytic products and very seldom in an explanation of analytic methodology or a definition of an analyst outside of some specific context. With very few exceptions, analysts did not describe intelligence analysis as its own discipline with its own identity, epistemology, and research tradition.

This is not necessarily uncommon. When physicians are asked to describe their profession, they tend to respond with a specific subdiscipline: "I'm a cardio-thoracic surgeon," for example. When asked for a more general description, however, they tend to respond, "I'm a doctor" or "I'm a physician." That is, in selective, insular professional cultures, practitioners are able to define their role in both a specific and general fashion. Intelligence analysts had difficulty defining their professional identity in a general way and often relied on specific context to explain what it is that they do and, by extension, who they are.

The perception of individual analysts regarding their professional identity was associated most often with their organization's function or with their own educational background and not with intelligence analysis as its own unique discipline.

I work counternarcotics.

I work counterterrorism.

I'm a military analyst.

I'm a leadership analyst.

I'm an economist.

I'm a political scientist.

In addition to these categories, many analysts described their professional identity in terms of intelligence collection methods or categories.

I do all-source analysis.

I'm a SIGINT analyst.

I'm an IMINT analyst.

I'm a technical analyst.

---

[17] George Mead was an American pragmatist philosopher and social psychologist, who, with John Dewey, made the University of Chicago the home of pragmatist philosophy and the "Chicago School" of sociology at the end of the 19th century. George Mead, *Mind, Self, and Society.*

The shift in focus to daily analytic products, the changes in the production cycle, and a heterogeneously defined professional discipline have had an additional effect on the professional identity of analysts within the Intelligence Community. Analysts often commented that they perceived their job and their daily work routine as more akin to reporting than to analysis.

> *Basically, on a day-to-day basis, it's like working at CNN, only we're CNN with secrets. Actually, it's more like CNN's* Headline News.

> *Imagine* USA Today *with spies—bullet points, short paragraphs, the occasional picture. You know, short and simple.*

> *I think of myself as a writer for the most important newspaper in the world.*

Many analysts expressed dissatisfaction with the shift in work processes from long-term forecasts and toward current reporting and the subsequent shift in their own professional identity within the Intelligence Community. The current sentiment about identity was often contrasted against an idealized past that was described as being freer of current production practices and products.

> *About 15 years ago, I would have described myself as a scholar. Now, I'm a reporter. I've got 15 people trying to change my work into bullet points. Presumably, nobody has time to read anymore.*

> *When I joined, it seemed that the word "analyst" was shorthand for "problem solver." Now, it's shorthand for "reporter."*

> *I'm proud of where I work. I'm proud of the job that we do. But, it is hard to take pride in one paragraph. I have to look at the big picture, or I would get discouraged.*

> *I spend most of my waking hours doing this, but I still can't really say what an analyst is.*

> *I'm not a reporter, and I'm not an academic. I'm somewhere in between.*

The heterogeneous descriptions and definitions of intelligence analysis as a professional discipline were consistent findings during this study, indicating that there needs to be a clear articulation and dissemination of the identity and epistemology of intelligence analysis. A clearly defined professional identity would help to promote group cohesion, establish interagency ties and relationships, and reduce intra- and interagency communication barriers by establishing a professional class throughout the Intelligence Community. At an individual level, a clearly defined professional identity helps to reduce job dis-

satisfaction and anxiety by giving larger meaning to an individual's daily actions.[18]

Finding: Analytic Training

> *When I started, there wasn't much training available. There were a few advanced courses, but, for the most part, it was on the job.*

A professional identity is generally a disciplinary norm, and it regularly occurs in other domains that are as cognitively demanding as intelligence analysis, such as medicine, aeronautics, and jurisprudence. These other domains practice a general system of professional enculturation that progresses from a basic education program to specialized training.[19] These training programs help to differentiate communities of practitioners from the general public, create specific and unique professional identities, and develop basic communication and task-specific skills. They also help the profession to continue to advance through formal research efforts.

This is not the case within the Intelligence Community as a whole. Generally, the intelligence agencies that do provide basic and advanced training do so independently of other intelligence organizations.[20] A number of intelligence agencies do not provide basic analytic training at all or have only recently begun to do so, relying instead on on-the-job experiences and informal mentoring.

> *We haven't had a culture of training analysts here in the past. It's only in the last year or so that we've started to change that.*

> *When I started here, analysts were considered administrative personnel. We didn't have a training program. I think they just started one this year.*

> *My background was technical analysis, and we had a lot of operational training where I used to work. But now that I'm doing more strategic analysis, I've had to make it up as I go along.*

Hinchman, *Memory, Identity, Community*; Carl Jung, *The Undiscovered Self*; George Levine, ed., *Constructions of the Self*.

[19] Enculturation is the process or mechanism by which a culture is instilled in a human being from birth until death. In this instance, professional enculturation refers to the acquisition of a professional identity through specific cultural rituals and practices, as displayed, for example, by practitioners who have graduated from medical school, law school, and basic military training.

[20] See footnote 7 in the Introduction for several recent cross-agency training initiatives.

We have a basic training program, but it is different from the other agencies. Our mission is different. The problem is that we talk past each other all the time.

When I got hired, I had an advanced degree. People assumed that, if I had a Masters, I could just figure out what I was supposed to do.

The focus of training within the community varies widely and is shaped by the mission of the agency, such as technical, tactical, and operational. Many spend a considerable amount of time teaching new analysts how to prepare briefings, write papers, and perform administrative functions unique to their agency. This is logical from the perspective of agency managers, who naturally believe that investments made in personnel, training, and readiness ought to be tailored specifically for their own organizations.

The problem with an agency-centric view is that, without a general communitywide training program for intelligence analysts, agencies and their analysts have difficulty finding, communicating, and interacting with one another.[21] Analysts often said they were disinclined to draw on resources outside of their own agency, indicating that either they do not know whom to contact or their experience in the past has been influenced by a strict organizational focus.

The media keep talking about intelligence failures and communication breakdowns in the Intelligence Community. What do they expect? We don't even speak the same language.

It's taken me 15 years to build my own network. If I didn't have my own contacts, I wouldn't know who to call.

I don't bother going outside. Our focus is different here.

We have official channels, but it only really works if you trust the person on the other end of the phone. That's hard to do if you don't know them.

Without an inclusive communitywide basic training program, differentiation between the intelligence analysis discipline, as a whole, and other fields of study is unlikely. A community of practitioners will have difficulty interacting with one another, communicating between and within organizations, and establishing a professional identity, which is a key ingredient in the development of a professional discipline.

CHAPTER THREE

A Taxonomy of Intelligence Variables[1]

Science is organized knowledge.

Herbert Spencer[2]

Aristotle may be the father of scientific classification, but it was biologist Carolus Linnaeus who introduced the first formal taxonomy—kingdom, class, order, genera, and species—in his *Systema Naturae* in 1735. By codifying the naming conventions in biology, Linnaeus's work provided a reference point for future discoveries. Darwin's development of an evolutionary theory, for example, benefited greatly from Linnaeus's creation of a hierarchical grouping of related organisms. The *Systema Naturae* taxonomy was not a fixed product but rather a living document. Linnaeus himself revised it through 10 editions, and later biologists have continued to modify it.[3]

In response to new discoveries and the development of new research methods in other domains, taxonomies were created to help organize those disciplines and to assist researchers in identifying variables that required additional study. The development of specific taxonomies—from highly structured systems, such as the periodic table of chemical elements, to less structured approaches, such as Bloom's Taxonomy[4]—is a key step in organizing knowl-

[1] A version of this chapter, "Developing a Taxonomy of Intelligence Analysis Variables," originally appeared in *Studies in Intelligence* 47, no. 3 (2003): 61–71.

[2] Herbert Spencer's *The Study of Sociology*, published in 1874, set the stage for the emergence of sociology as a discipline.

[3] Ernst Haeckel introduced *phylum* to include related classes and *family* to include related genera in 1866. The Linnaeus taxonomy is currently being revised to accommodate genomic mapping data.

edge and furthering the growth of individual disciplines. A taxonomy differentiates domains by specifying the scope of inquiry, codifying naming conventions, identifying areas of interest, helping to set research priorities, and often leading to new theories. Taxonomies are signposts, indicating what is known and what has yet to be discovered.

This chapter, to which more than 100 individuals contributed their time and advice, proposes a taxonomy for the field of intelligence. It is my hope that the resulting organized listing of variables will help practitioners strengthen their understanding of the analytic process and point them in directions that need additional attention.

Intelligence Analysis

> *We could have talked about the science of intelligence, but . . . the science of intelligence is yet to be invented.*
>
> Charles Allen[5]

Developing an intelligence taxonomy is complicated by the fact that the literature in the field is episodic and reflects specialized areas of concern. Perhaps it is best to begin with what appears to be a key distinction between general analysis and intelligence analysis, that of solving a problem in the public domain, and solving a problem in a private or secret domain.

Ronald Garst articulates two arguments that are used to support this distinction: intelligence analysis is more time sensitive than analysis in other domains and it deals with information that intentionally may be deceptive.[6] The notion that intelligence is uniquely time sensitive is questionable, however. Intelligence is not the only domain where time constraints can force decisions to be made before data are complete. Time is always a key variable, whether one is in an operating room or in a cockpit. To be sure, intelligence is a life and death profession, but so are medicine and mass transportation. In each instance, failure can mean casualties.

Garst's point about intentional deception is more germane. With the possible exception of business and financial markets, analysts in other fields seldom deal with intentional deception. As discussed in Chapter One, Michael Warner makes a good case for secrecy being the primary variable distinguish-

---

[4] See Benjamin S. Bloom, *Taxonomy of Educational Objectives*. Bloom's taxonomy is a classification of levels of intellectual behavior in learning, including knowledge, comprehension, application, analysis, synthesis, and evaluation.

[5] Comment made by the Associate Director of Central Intelligence for Collection at a public seminar on intelligence at Harvard University, spring 2000.

[6] Ronald Garst, *A Handbook of Intelligence Analysis.*

ing intelligence from other such activities.[7] He argues that the behavior of the subject of intelligence changes if the subject is aware of being observed or analyzed. As discussed earlier, Warner's argument is supported by a long history of psychological research, beginning with an experimental program between 1927 and 1930 at Western Electric's Hawthorne Works in Chicago.[8]

Intentional deception can occur outside intelligence—in connection with certain law enforcement functions, for example—but most of the professional literature treats this as the exception rather than the rule. In the case of intelligence analysis, deception *is* the rule; the validity of the data is always in doubt. Moreover, intelligence analysts are specifically trained to take deception into account as part of the analytic process—to look for anomalies and outliers instead of focusing on the central tendencies of distribution.

The taxonomy being developed here requires a definition of intelligence analysis that is specific to the field. Intelligence pioneer Sherman Kent, who saw intelligence as a "special category of knowledge," laid the foundation for understanding the activities inherent in intelligence analysis by demonstrating that the analytic process itself was subject to being analyzed.[9] Kent's approach to analysis was to reduce the process to smaller functional components for individual study.[10] For example, he described intelligence analysis as having a basic descriptive element, a current reporting element, and an estimative element.

Following suit, other authors focused attention on the process or methodological elements of intelligence analysis. In *Intelligence Research Methodology*, Jerome Clauser and Sandra Weir followed Kent's three functional areas and went on to describe basic research foundations and the inductive and deductive models for performing intelligence analysis.[11] Garst's *Handbook of Intelligence Analysis* contains less background in basic research methods than Clauser and Weir's book, but it is more focused on the intelligence cycle.[12]

Bruce Berkowitz and Allan Goodman highlight the process of strategic intelligence and define intelligence analysis as: "[T]he process of evaluating and transforming raw data into descriptions, explanations, and conclusions for intelligence consumers."[13] Lisa Krizan, too, focuses on process. She writes

---

[8] The Hawthorne Effect. See footnote 5 in Chapter Two.

[9] Sherman Kent, *Strategic Intelligence for American World Policy.*

[10] See Chapter Seven for a fuller discussion of this approach, now usually referred to as meta-analysis.

[11] Jerome K. Clauser and Sandra M. Weir, *Intelligence Research Methodology.*

[12] See also: Morgan Jones, *The Thinker's Toolkit*. Jones's book is a popular version of the work of Garst and Clauser and Weir in that it describes a collection of analytic methods and techniques for problem-solving; however, the methods are not necessarily specific to intelligence.

that, "At the very least, analysis should fully describe the phenomenon under study, accounting for as many relevant variables as possible. At the next higher level of analysis, a thorough explanation of the phenomenon is obtained, through interpretation of the significance and effects of its elements on the whole."[14] In addition, several authors have written about individual analytic approaches.[15]

Although the referenced works focus on methods and techniques, they do not suggest that analysis is limited to these devices. The view that analysis is both a process and a collection of specific techniques is explicit in the above definitions. Analysis is seen as an action that incorporates a variety of tools to solve a problem. Different analytic methods have something to offer different analytic tasks.

Although largely implicit in the above definitions, analysis is also seen as a product of cognition, and some authors directly link the two. Robert Mathams defines analysis as: "[T]he breaking down of a large problem into a number of smaller problems and performing mental operations on the data in order to arrive at a conclusion or generalization."[16] Avi Shlaim writes: "Since the facts do not speak for themselves but need to be interpreted, it is inevitable that the individual human propensities of an intelligence officer will enter into the process of evaluation."[17] Yet others describe analysis as a process whereby: "[I]nformation is compared and collated with other data, and conclusions that also incorporate the memory and judgment of the intelligence analyst are derived from it."[18]

Several authors make the case that analysis is not just a product of cognition but is itself a cognitive process. J. R. Thompson and colleagues write that "[I]ntelligence analysis is an internal, concept-driven activity rather than an external data-driven activity."[19] In his *Psychology of Intelligence Analysis*, Heuer observes: "Intelligence analysis is fundamentally a mental process, but understanding this process is hindered by the lack of conscious awareness of the workings of our own minds."[20] Ephraim Kam comments: "The process of intelligence analysis and assessment is a very personal one. There is no agreed-upon analytical schema, and the analyst must primarily use his belief

system to make assumptions and interpret information. His assumptions are usually implicit rather than explicit and may not be apparent even to him."[21]

These definitions reflect the other end of the spectrum from those concerned with tools and techniques. They suggest that the analytic process is a construction of the human mind and is significantly different from individual to individual or group to group. Certainly, Kam goes farthest along this path, but even he does not suggest that one forgo tools; rather, he says that the process of choosing the tool is governed by cognition as well.

Recognizing that the scope of intelligence analysis is so broad that it includes not only methods but also the cognitive process is a significant step. Viewing analysis as a cognitive process opens the door to a complex array of variables. The psychology of the individual analyst must be considered, along with individual analytic tools. In the broadest sense, this means not merely understanding the individual psyche but also understanding the variables that interact with that psyche. In other words, *intelligence analysis is the socio-cognitive process,*[22] *occurring within a secret domain, by which a collection of methods is used to reduce a complex issue to a set of simpler issues.*

Developing the Taxonomy

> *The first step of science is to know one thing from another. This knowledge consists in their specific distinctions; but in order that it may be fixed and permanent distinct names must be given to different things, and those names must be recorded and remembered.*
>
> Carolus Linnaeus

My research was designed to isolate variables that affect the analytic process. The resulting taxonomy is meant to establish parameters and to stimulate dialogue in order to develop refinements. Although a hierarchic list is artificial and rigid, it is a first step in clarifying areas for future research. The actual variables are considerably more fluid and interconnected than such a structure suggests. Once the individual elements are refined through challenges in the literature, they might be better represented by a link or web diagram.[23]

To create this intelligence analysis taxonomy, I used Alexander Ervin's applied anthropological approach, which employs multiple data collection methods to triangulate results.[24] I also drew on Robert White's mental work-

---

[21] Ephraim Kam, *Surprise Attack. The Victim's Perspective*, 120

[22] That is, analysis does not occur in a vacuum. It is socially constructed. See Lev Vygotsky, *Mind and Society.*

[23] See Chapter Four for Judith Meister Johnston's systems analysis approach to describing the fluidity of the intelligence process.

load model, David Meister's behavioral model, and the cognitive process model of Gary Klein and his colleagues.[25] Each model focuses on a different aspect of human performance: White's examines the actual task and task requirements; Meister's looks at the behavior of individuals performing a task; and Klein's uses verbal protocols to identify the cognitive processes of individuals performing a task.

Surveying the literature. My research began with a review of the literature, both for background information and for the identification of variables. The intelligence literature produced by academics and practitioners tends to be episodic, or case-based. This is not unique to the field of intelligence. A number of disciplines—medicine, business, and law, for example—are also case-based. Many of the texts were general or theoretical rather than episodic. Again, this is not an uncommon phenomenon. The review yielded 2,432 case studies, journal articles, technical reports, transcripts of public speeches, and books related to the topic. I then narrowed the list to 374 pertinent texts on which a taxonomy of intelligence analysis could be built, and I analyzed them to identify individual variables and categories of variables that affect intelligence analysis.[26]

Using a methodology known as "Q-Sort," by which variables are sorted and categorized according to type, I read each text and recorded the variables that each author identified.[27] These variables were then sorted by similarity into groups. Four broad categories of analytic variables emerged from this process.[28]

Refining the prototype. Next, I used the preliminary taxonomy derived from my reading of the literature to structure interviews with 51 substantive experts and 39 intelligence novices. In tandem, I conducted two focus group sessions, with five individuals in each group. As a result of the interviews and focus group discussions, I added some variables to each category, moved some to different categories, and removed some that appeared redundant.

Testing in a controlled setting. Finally, to compare the taxonomy with specific analytic behaviors, I watched participants in a controlled intelligence analysis–training environment. Trainees were given information on specific

[28] I would like to credit Dr. Forrest Frank of the Institute for Defense Analyses for his suggestions regarding the naming convention for the categories of variables in the accompanying chart.

cases and directed to use various methods to analyze the situations and to generate final products. During the training exercises, the verbal and physical behavior of individuals and groups were observed and compared with the taxonomic model. I participated in a number of the exercises myself to gain a better perspective. This process corroborated most of the recommendations that had been made by the experts and novices and also yielded additional variables for two of the categories.

The resulting taxonomy is purely descriptive. It is not intended to demonstrate the weight or importance of each variable or category. That is, the listing is not sufficient to predict the effect of any one variable on human performance. The intention of the enumeration is to provide a framework for aggregating existing data and to create a foundation for future experimentation. Once the variables have been identified and previous findings have been aggregated, it is reasonable to consider experimental methods that would isolate and control individual variables and, in time, indicate sources of error and potential remediation

Systemic Variables

    - Policy

Systemic Variables

The column of Systemic Variables incorporates items that affect both an intelligence organization and the analytic environment. Organizational variables encompass the structure of the intelligence organization; leadership, management, and management practices; history and traditions; the working culture, social practices within the organization, and work taboos; and organizational demographics. They also include internal politics, the hierarchical reporting structure, and material and human resources. Industrial and organizational psychology, sociology, and management studies in business have brought attention to the importance of organizational behavior and its effect on individual work habits and practices. The works of Allison, Berkowitz and Goodman, Elkins, Ford, Godson, and Richelson, among others, examine in general the organizational aspects of intelligence.[29]

Systematic Variables
- User Requirements
- Operations
  - Information Acquisition
    - Collection Methods
      - Overt
      - Covert
    - Information Reliability
      - Reproducible
      - Consistent
    - Information Validity
      - Historical
      - Single Source
      - Dual Source
      - Triangulation
- Information Archive
  - Storage
  - Access
  - Correlation
  - Retrieval
- Analytical Methodology
  - Approach
    - Intuitive
    - Structured
    - Semi-structured
  - Information Processing
    - Historical Information
    - Current Information
  - Decision Strategies
    - Estimative
    - Predictive
- Reporting
  - Verbal Methods
  - Written Methods

The Systemic Variables category also focuses on environmental variables. These include such external influences on the organization as consumer needs and requirements, time limitations, and methods for using the information; and the consumer's organization, political constraints, and security issues. The works of Betts, Hulnick, Hunt, Kam, and Laqueur address the environmental and consumer issues that affect intelligence analysis.[30] Case studies that touch on various systemic variables include: Allison, on the Cuban missile crisis; Betts, on surprise attacks; Kirkpatrick, on World War II tactical intelligence operations; Shiels, on government failures; Wirtz, on the Tet offensive in Vietnam; and Wohlstetter, on Pearl Harbor.[31]

Systematic Variables

The Systematic Variables are those that affect the process of analysis itself. They include the user's specific requirements, how the information was acquired, the information's reliability and validity, how the information is stored, the prescribed methods for analyzing and processing the information, specific strategies for making decisions about the information, and the methods used to report the information to consumers.

A number of authors have written about the analytic tools and techniques used in intelligence, among them Clauser and Weir, on intelligence research methods; Jones, on analytic techniques; and Heuer, on alternative competing hypotheses.

Comparatively little work has been done comparing structured techniques to intuition. Robert Folker's work is one of the exceptions; it compares the effectiveness of a modified form of alternative competing hypotheses with intuition in a controlled experimental design. His study is unique in the field and demonstrates that experimental methods are possible. Geraldine Krotow's research, on the other hand, looks at differing forms of cognitive feedback during the analytic process and makes recommendations to improve intelligence decisionmaking.[32]

Idiosyncratic Variables

- Weltanschauung (world-view)
- Affiliation
  - Familial
  - Cultural
  - Ethnic

  - Domain
  - Location
  - Mentor
- Training
  - Organizational
  - Domain
  - Procedural
- Readiness
  - Resources
  - Facilities

Idiosyncratic Variables

Variables in the third column are those that influence individuals and their analytic performance. These include the sum of life experiences and enculturation—familial, cultural, ethnic, religious, linguistic, and political affiliations—that identify an individual as a member of a group. I have used the German word *Weltanschauung* (customarily rendered in English as "world view") to denote this concept. These idiosyncratic variables also encompass such psychological factors as biases, personality profiles, cognitive styles and processing, cognitive loads,[33] expertise, approach to problem-solving, decisionmaking style, and reaction to stress. Finally, there are such domain variables as education, training, and the readiness to apply knowledge, skills, and abilities to the task at hand.

The relevant psychological literature is extensive. Amos Tversky and Daniel Kahneman began to examine psychological biases in the early 1970s.[34] Their work has found its way into the intelligence literature through Butterfield,

[32] Geraldine Krotow, *The Impact of Cognitive Feedback on the Performance of Intelligence Analysts*, 176.

[33] "Cognitive loads" are the amount/number of cognitive tasks weighed against available cognitive processing power.

[34] Amos Tversky and Daniel Kahneman, "The Belief in the 'Law of Small Numbers'" and "Judgment Under Uncertainty: Heuristics and Biases."

Davis, Goldgeier, and Heuer, among others.[35] Decisionmaking and problem-solving have been studied since the early 1920s, and these topics are reflected in Heuer's work as well.[36] Personality-profiling, too, is well understood and has had an impact on recent intelligence practices and theory.[37]

Communicative Variables
- Formal
  - Inter-organization
    - Hierarchical
    - Inter-division
    - Inter-group
  - Intra-organization
    - Hierarchical
    - Intra-division
    - Intra-group
  - Individual
    - Hierarchical
    - Inter-division
    - Intra-group
- Informal
  - Inter-organization
    - Hierarchical
    - Inter-division
    - Inter-group
  - Intra-organization
    - Hierarchical
    - Intra-division
    - Intra-group
  - Individual
    - Hierarchical
    - Inter-group
    - Intra-group
  - Technology
    - Networked Analysis
    - Collaboration

Other well-researched areas, however, have yet to be studied in the context of intelligence. Acculturation and enculturation, educational factors, and training strategies, for example, may yet yield interesting results and insights into the field of intelligence.[38]

Communicative Variables

The fourth category contains variables that affect interaction within and among groups. Because communication is the vital link within the system—among processes and among individuals—this group of variables logically could be included in each of the other three categories. Its broad relevance, however, makes it seem reasonable to isolate it as a distinct area of variability. The Communicative Variables include formal and informal communications within an organization (from products to e-mails), among organizations, and between individuals and the social networks they create. In his essay on estimative probability, Kent highlights this area by describing the difficulty that producers of intelligence have in communicating the likelihood of an event to their consumers.[39] In addition to addressing organizational issues, case studies by Wohlstetter and others touch on communication and social networks and the impact that communication

has on the analytic process.[40] This is an area that could benefit from additional study.

Conclusion

> *There is rarely any doubt that the unconscious reasons for practicing a custom or sharing a belief are remote from the reasons given to justify them.*
>
> —Claude Levi-Strauss[41]

As it is now practiced, intelligence analysis is art, tradecraft, and science. There are specific tools and techniques to help perform the tasks, but, in the end, it is left to individuals to use their best judgment in making decisions. This is not to say that science is not a part of intelligence analysis. Science is born of organized knowledge, and organizing knowledge requires effort and time. The work on this taxonomy is intended to help that process by sparking discussion, identifying areas where research exists and ought to be incorporated into the organizational knowledge of intelligence, and identifying areas where not enough research has been performed.

There are a number of parallels in the field of medicine, which, like intelligence, is art, tradecraft, and science. To solve problems, practitioners are trusted to use their best judgment by drawing on their expertise. What is important to remember is that there are numerous basic sciences driving medical practice. Biology, chemistry, physics, and all of the subspecialties blend together to create the medical sciences, the foundation on which modern medicine rests. The practice of medicine has been revolutionized by the sciences that underpin its workings.

Intelligence analysis has not experienced that revolution. Unlike medicine, the basic sciences that underpin intelligence are the human sciences, which are considerably more multivariate and more difficult to control. Because of these factors, it is a more complex task to measure "progress" in the human sciences. Even so, there are numerous domains from which intelligence may borrow. Organizational behavior is better understood today than ever before. Problem-solving and decisionmaking have been researched since the 1920s.

---

[40] Wohlstetter.

[41] Claude Levi-Strauss wrote *Structural Anthropology* in 1958, setting the stage for structuralism to emerge as an analytic interpretive method. Broadly, structuralism seeks to explore the interrelationships (the "structures") through which meaning is produced within a culture. This meaning, according to structural theory, is produced and reproduced through various practices, phenomena, and activities that serve as systems of "signification." A structuralist studies activities as diverse as food preparation and serving rituals, religious rites, games, literary and non-literary texts, and forms of entertainment to discover the ways in which cultural significance develops.

Structural anthropology addresses many of the enculturation and identity issues that affect individual behavior. Cognitive scientists are building models that can be tested in experimental conditions and used for developing new tools and techniques. Sociology and social theory have much to offer in studying social networks and communication.

The organization of knowledge in intelligence is not a small task, but I believe that the effort should be undertaken for the betterment of the profession. The taxonomy proposed here could serve as a springboard for a number of innovative projects, for example: development of a research matrix that identifies what is known and how that information may be of use in intelligence analysis, setting a research agenda in areas of intelligence that have been insufficiently studied, application of research from other domains to develop additional training and education programs for analysts, creation of a database of lessons learned and best practices to build a foundation for an electronic performance support system, integration of those findings into new analytic tools and techniques, and development of a networked architecture for collaborative problem-solving and forecasting. It is my hope that this taxonomy will help intelligence practitioners take steps in some of these new directions.

CHAPTER FOUR

Testing the Intelligence Cycle Through Systems Modeling and Simulation

Judith Meister Johnston[1]
Rob Johnston

Throughout the Intelligence Community, the process of analysis is represented conventionally by a model known as the Intelligence Cycle (See next page). Unfortunately, the model omits elements and fails to capture the process accurately, which makes understanding the challenges and responsibilities of intelligence analysis much more difficult. It also complicates the tasks of recognizing where errors can occur and determining methods for change based on accurate predictions of behavior. Our analysis of the Intelligence Cycle, employing a systems approach and a simulation created to represent it, demonstrated these shortcomings.[2] Because of its wide acceptance and use in training and in discussions of the analytic process, the traditional representation of the Intelligence Cycle will be closely considered in this chapter, especially with regard to its impact on analytic products, its effectiveness, and its vulnerability to error and failure.

The Traditional Intelligence Cycle

The Intelligence Cycle is customarily illustrated as a repeating process consisting of five steps.[3] ***Planning and direction*** encompasses the management of

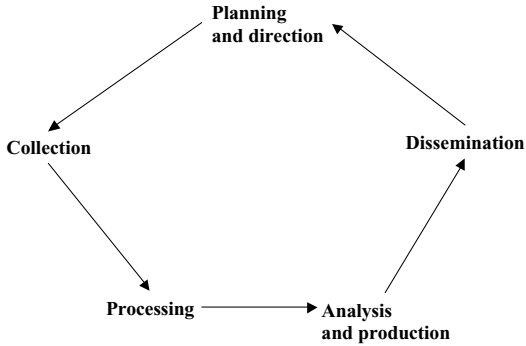
[1] Dr. Judith Meister Johnston is an educational psychologist with expertise in human performance technology and instructional systems design. A Booz Allen Hamilton Associate, she supports human factors work for the Intelligence Community.

[2] Simulation involves the development of a computer-based model that represents the internal processes of an event or situation and estimates the results of proposed actions.

the entire effort and involves, in particular, determining collection requirements based on customer requests. ***Collection*** refers to the gathering of raw data to meet the collection requirements. These data can be derived from any number and type of open and secret sources. ***Processing*** refers to the conversion of raw data into a format analysts can use. ***Analysis and production*** describes the process of evaluating data for reliability, validity, and relevance; integrating and analyzing it; and converting the product of this effort into a meaningful whole, which includes assessments of events and implications of the information collected. Finally, the product is ***disseminated*** to its intended audience.[4]

The Traditional Intelligence Cycle



In some ways, this process resembles many other production cycles. It is prescriptive, structured, made up of discrete steps, and expected to yield a specific product. The traditional depiction of the process in the Intelligence Cycle, however, is not an accurate representation of the way intelligence is produced. The notion of a cycle assumes that the steps will proceed in the prescribed order and that the process will repeat itself continuously with reliable results. This type of representation gives the impression that all inputs are constant and flow automatically, but it does not address elements that may influence the movement of the cycle, positively or negatively.

The most significant assumption about the Intelligence Cycle model, that it provides a means for helping managers and analysts deliver a reliable product, should be examined at the outset. This can be accomplished through two types of analyses. The first is a systematic examination of the elements of the process, the inputs it relies on, and the outcomes that can be expected. The second uses a systemic approach to identifying the relationships of the elements in the process and their influence on each other.

[3] Central Intelligence Agency, *A Consumer's Guide to Intelligence*.
[4] Central Intelligence Agency, *Factbook on Intelligence.*

Systematic Analysis

Many disciplines (for example, business process, organizational management, human performance technology, program evaluation, systems engineering, and instructional systems design) employ specific methods to analyze the effectiveness of products, programs, or policy implementation. Although they are often given different, domain-specific names and may involve varying levels of detail, these analytic methods involve the identification of *inputs*, *processes*, and *outputs*. Once these elements are identified, the evaluation process maps the relationships of the inputs, their implementation in processes, and their impact on intended—as opposed to actual—outputs.[5] The reasoning underlying this approach is that an effective product, result, or action is one that matches its objectives and that these objectives are reached by processes that logically lead from the objectives to results. Along the way, existing practices and barriers to reaching goals effectively can be identified. Finally, interventions, which can range in complexity from simple job aids to a complete restructuring of the process, can be proposed and implemented and their impacts assessed.[6]

This method of analysis has been employed successfully to evaluate processes that have characteristics similar to the Intelligence Cycle, and we use it here to examine the effectiveness of the Intelligence Cycle and its utility in representing the creation of sound analytic products while avoiding failure or error.

Findings Based on Systematic Analysis

The Intelligence Cycle is represented visually to provide an easy-to-grasp and easy-to-remember representation of a complex process. Although this type of representation may make the flow of information and the interrelationships of steps easy to identify, it does not indicate who or what may affect the completion of a step or the resources needed to begin the next step. In its concise form, then, the visual representation of the Intelligence Cycle is reduced to a map of information handling. Without explicit descriptions of the steps in the process or the benefit of prior knowledge, it can raise questions of accuracy and completeness and can occasion misconceptions, particularly concerning the roles and responsibilities of intelligence analysts.

Inputs, Processes, and Outputs of the Intelligence Cycle

Inputs	Processes	Outputs
Policymaker and other stakeholder questions, requirements	***Direction***	Data collection requirements
Data collection requirements, assessment of available resources and capabilities	***Planning***	Task assignment, potential data sources, focus of analysis
Open-source data: foreign broadcasts, newspapers, periodicals, books; Classified data: case officer, diplomatic, and attaché reports, electronics, satellite photos	***Collection***	Potentially relevant data
Potentially relevant data	***Processing:*** Reduction of data in a variety of formats to consistent pieces of usable data	Usable Data
Usable data	***Analysis***: Integration, evaluation, assessment of reliability, validity, and relevance of data	Findings
Analytic review	*Production*: Peer review, supervisory review	Written briefs, studies, long range assessments, short range assessments, oral briefs, national intelligence estimates
Written briefs, studies, long-range assessments, short-range assessments, oral briefs, national intelligence estimates	**Dissemination**	Appropriate product to address customer's need

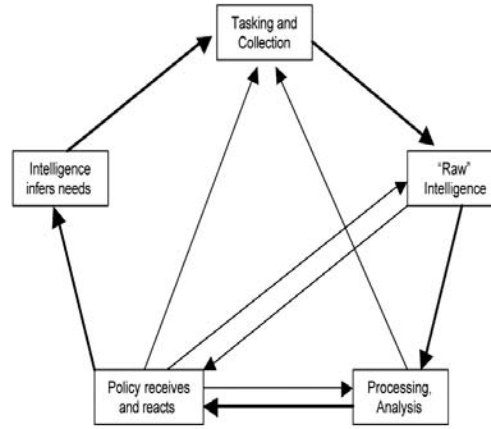
The table above depicts a more detailed input, process, and output analysis and makes some relationships clearer—for example, the steps that include two actions (planning and direction, analysis and production) have been separated into distinct processes—but it sill leaves a number of questions unanswered. It is difficult to see from this analysis specifically who is responsible for providing inputs, carrying out the processes, and producing outputs; and what requirements are expected of the inputs and outputs.

An important issue that this analysis only partly clarifies is the role of analysts. Nor does it demonstrate how great a burden the process places on them,

an especially important point. Assuming that the actions identified in the "Processes" column are ultimately the responsibility of the intelligence analyst, the steps of the process move from a heavy reliance on information coming in from sources outside the analyst's control to a heavy reliance on the analyst to produce and manage the final submission of the product.

Another important defect in this analysis is that steps in the cycle do not accurately represent the differences in the cognitive complexity involved in preparing a long-range assessment or a national intelligence estimate and that required for a two-paragraph brief on a current situation. The same can be said about the process required to develop each of the products.

Treverton's "Real" Intelligence Cycle



The Intelligence Cycle depicts a sequential process and does not provide for iterations between steps. This is not an accurate reflection of what happens, particularly in the collection and production steps, where the challenges of defining policymaker needs and shaping collection necessitate repeated refinement of requirements by policymakers or of inferences by the Intelligence Community. A more accurate picture of the steps in the process and their iterative tendencies may be seen in Greg Treverton's model, which he terms the "Real" Intelligence Cycle (above).[7]

Mark Lowenthal proposes another model.[8] Although presented in a more linear fashion than Treverton's, it focuses on the areas where revisions and reconsiderations take place, representing iteration in a slightly different light. Both models provide a more realistic view of the entire process. In addition, assuming that the analyst's role is represented by the "Processing, Analysis" box, the Treverton model allows us to focus visually and conceptually on the demands that the process can place on the analyst. However, neither model

[7] Gregory F. Treverton, *Reshaping National Intelligence in an Age of Information.*
[8] Mark W. Lowenthal, *Intelligence: From Secrets to Policy.*

provides an effective way of showing who is responsible for what, and neither reflects the impact of the work on the individuals responsible for producing the reports—particularly the analyst—nor the reliance of the analyst on a variety of factors beyond his or her control.

In sum, this brief evaluation of the Intelligence Cycle with respect to its inputs, processes, and outputs shows us that the traditional model:

- assumes the process works the same way for all objectives, regardless of complexity and cognitive demands;
- does not represent the iterative nature of the process required for meeting objectives;
- does not identify responsibilities for completing steps and allows for misconceptions in this regard;
- does not accurately represent the impact of resource availability on analysts.

To better understand these limitations and the relationships among elements in the process, it is necessary to step back and take a longer view of the process, using a different method of analysis.

Systemic Analysis

If we think of the phenomenon that is being described by the Intelligence Cycle as a system and perform a systems analysis, we may be able to derive a greater understanding of process relationships, a better representation of the variables affecting the process, and a greater level of detail regarding the process itself.

The premise that underlies systems analysis as a basis for understanding phenomena is that the whole is greater than the sum of its parts. A systems analysis allows for the inclusion of a variety of influences and for the identification of outliers that are obfuscated in other types of analyses but that often play major roles. A systems analysis is accomplished through the examination of phenomena as cause-and-effect patterns of behavior. This approach is called a "closed feedback loop" in systems analysis. It requires a close examination of relationships and their influences, provides a longer view of these relationships, and often reveals new insights based on trends rather than on discrete events.[9]

The systems model diagrammed below is a visual representation of the process. The elements of the Intelligence Cycle are identified in terms of their

[9] Fritjof Capra, "Criteria of Systems Thinking"; David L. Kaufman, Jr., *Introduction to Systems Thinking*.

relationships with each other, the flow of the process, and phenomena that influence the elements and the flow. The model uses four icons to represent actions and relationships within the system: stocks, flows, converters, and connectors. The icons and their placement within the systems model show the relationships of the elements of the analyzed phenomenon.

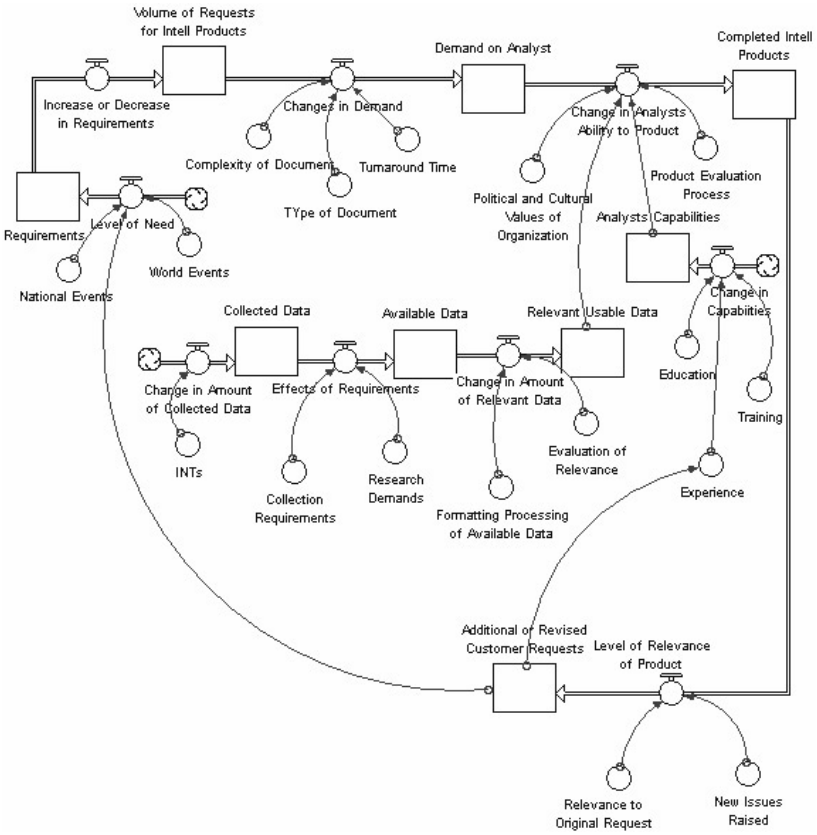
The Components of the Systems Model

Icon	Purpose
	***Stocks*** represent accumulations. These are quantities that can increase or decrease, such as the amount of work that needs to be completed, the time available in which to do it, experience one might bring to a task.
	***Flows*** represent activities. They control the filling or draining of stocks, causing conditions to change.
	Converters change inputs into outputs. They usually represent the variables that initiate change. In the example, a converter might represent a sudden and drastic world event.
	***Connectors*** link elements to other elements, representing assumptions about what depends on what.

The systems model of the Intelligence Cycle provides insights into the process of analysis as well as other factors that can influence the successful and timely completion of an intelligence task. It also provides a way to understand the impact of change in any area of the Intelligence Cycle on other elements, either through reflection or by applying mathematical values to the influences and relationships and running simulations of the model.

Demand. As in the traditional Intelligence Cycle model, the systems model begins with requirements for information that generally come from policymakers. These requirements are represented by a *stock* (found in the upper left-hand quarter of the diagram) because they can increase or decrease based on the level of need for information (a *flow*). The change in level of need is influenced by national and world events, as well as by new questions or requests for clarification of items in previously delivered products. Each request does not contribute equally to the amount of work, which is influenced by the types of documents or products requested, the complexity of the prod-

Systems Model of the Intelligence Cycle



ucts, and the turnaround time imposed. All of these factors determine the level of demand placed on the analyst.

Production. This section focuses on the process of producing intelligence products. The elements described are tied, directly or indirectly, to the flow that represents changes in the analyst's ability to produce. In turn, these changes cause products to be completed and requests of policymakers to be fulfilled. It is important to note that this portion of the model deals with factors that influence the *act* of analysis and does not attempt to address *methods* of analysis.

Factors that influence the ability of analysts to produce are numerous and complex, as shown. First and foremost are the capabilities an analyst brings to the task. This is represented by a *stock*—usually an increasing one—that derives from an analyst's education, training, and experience.

Another influence is the number and frequency of evaluations and revisions imposed on a work in progress. That a draft of the product must be reviewed and edited by a number of others places variable constraints on the time available for creating the original draft. This factor increases in significance when the product requested has a short deadline.

Political and cultural values of the organization also have an influence, usually constraining. Strictly following traditional heuristics and methods and meeting organizational or management expectations may influence both an analyst's ability to produce and the quality of the output. The weight of these influences will vary depending on the experience of the analyst.

Another factor that influences the analyst's ability to produce is the amount of relevant, usable data (a *stock*) available. The term "relevant, usable data" describes all collected intelligence that is relevant to meeting the request and that exists in a format that can be used to develop the product. To become usable, the data must go through steps that are influenced by a variety of *other* people, organizations, systems, and technologies. This process is represented by the stock and flow chain that appears across the middle of diagram.

Data are collected from a variety of sources, represented by the INTs converter.[10] These data add to the stock of collected data. The ways in which accumulated collected data are converted to the stock of available data are influenced by internal research demands and specific collection requirements imposed by analysts, policymakers, and others. Once the data are processed and put into an agreed format for use by intelligence producers and consum-

[10] INT is an abbreviation for intelligence, usually contained in acronyms for the various types of intelligence collected by the Intelligence Community, for example, HUMINT (human intelligence) and SIGINT (signals intelligence).

ers, they add to the accumulation of material that affects the ability of an analysts to produce.

Product Influences. The accumulation of completed intelligence products, which is represented as a *stock*, is not in practice an end-state for analysis. A customer may respond to a delivered product by levying additional or revised tasking. In all instances, this information influences the level of need for policymaker requirements and causes the process to begin again. Each iteration of the process is different, not because the steps in the process change, but because those responsible for carrying out the steps have changed as a result of their participation in the previous run. These changes can include a greater level of experience with the process, with the customer, with the topic area, or with the quirks of the organization and its processes. The changes are a manifestation of the concept that the system is greater than the sum of its parts.

Findings Based on Systems Analysis

Systems analysis clearly demonstrates the defects of the traditional Intelligence Cycle model. To recapitulate briefly, the traditional model merely represents a simple list of steps rather than a dynamic closed feedback loop. In addition, although the steps are meant to be performed by several different actors, the model does not provide useful information about what each actually contributes to the cycle, nor does it accurately represent the path a request takes as it is addressed. Another problem with the traditional model is that none of its features help identify ways of developing a consistent product. For example, there is no allowance for a statement of objectives or for any formative or summative evaluations to check that objectives have been met.

On the other hand, the model that resulted from a systems analysis provides a more complex view. That model shows cause and effect, and it shows what other elements have an impact on the development of intelligence products and how and why elements depend on other elements. These advantages of the systems model are clearly apparent in considering the role of analysts in production, a crucial element of the cycle that the traditional model all but ignores.

Impact on Production and Analyst's Control. Study of the systems model shows that the "Analyst's Ability to Produce" (upper right-hand quarter of the diagram) is the central factor in the production cycle and the driver of the feedback loop. The systems view also makes us aware of a less obvious fact that is critically important to a discussion of analytic failure.

A look at the entire system makes readily apparent the number of factors of varying complexity that influence an analyst's ability to produce: the analyst's capabilities; the product evaluation process; the political and cultural values of

the organization; the amount of relevant, usable data and actions related to transforming collected data to relevant, usable data; and the level of demand on the analyst. Of these five factors, only one—the analyst's capabilities—is an internal factor and somewhat under the analyst's control.[11] Yet, even though the other factors are out of the analyst's control, the analyst must rely on them to accomplish the goal and to meet the expectations of customers and the organization. When the proportion of external factors to internal factors is as unbalanced as the systems model of the Intelligence Cycle demonstrates, the causes of stress in the analytic environment increase, as does the possibility that stress will occur.

In such a high stress environment, where the critical person is responsible for delivering a product whose development relies on a great number of factors beyond his or her control, there is greater risk of error, with an increased likelihood of incomplete or incorrect products. Tendencies to use shortcuts, to avoid creative thinking, and to minimize the perceived impact of certain events or actions become more apparent in this situation, especially if their implementation means reducing the workload and the stressors. Results of working in such an environment can include increased personnel turnover, missed or undervalued information, lack of attention to detail, decreased motivation, and a lack of creativity in approaching analysis. Moreover, with analysts so central to the process, their actions may have a widespread and, thus, powerful influence on the entire system. This change can be positive or negative. Given the number of elements influencing the analyst that are out of his or her control, however, it is unlikely that the changes would positively affect the quality, accuracy, and number of intelligence products created.

Recommendations

Revisit the traditional intelligence model. The traditional Intelligence Cycle model should either be redesigned to depict accurately the intended goal, or care should be taken to discuss explicitly its limitations whenever it is used. Teaching with an inaccurate aid merely leads to misconceptions that can result in poor performance, confusion, and a need for unlearning and reteaching. If the objective is to capture the entire intelligence process, from the request for a product to its delivery, including the roles and responsibilities of Intelligence Community members, then something more is required. This should be a model that pays particular attention to representing accurately all the elements of the process and the factors that influence them.

---

[11] Even the factors that contribute to the analyst's capabilities, notably experience and training, may be seen to be under the control of others when access to, and selection of, them are considered.

Further Study. The use of simulation allows us to determine flaws in the system that basic informational models cannot address. A simulation moves the image of the Intelligence Cycle from a picture that selectively and indiscriminately illustrates a series of events to a holistic and realistic representation of events, responsibilities, processes, and their impact on each other. The simulation of the Intelligence Cycle developed for this analysis is merely a first step. Further work should be done with it to validate the representations, test for vulnerabilities, predict outcomes, and accurately recommend changes.

Lightening the Analyst's Load. The systems model reveals a serious imbalance in the work processes analysts can and cannot control. It is unrealistic and unnecessary to consider reorganizing the process to correct this defect. However, there are actions that could be taken to provide analysts more control over external factors without significantly altering their roles. These actions would also reduce the amount of potential influence that one group could have over the entire process.

First, analysts might be designated as reports or research analysts. The former would prepare products that address short-term tasks, such as writing for the PDB. As the process of collection and analysis is different for short- and long-term products, this might be a responsibility assigned primarily to more junior analysts. Research analysts might be those with more experience. Freed from the obligation to prepare short-term reports, senior analysts would be available for more intense research efforts, such as those required for an NIE. In addition, cross-training or experience in creating both products and the flexibility to switch from one process to another would provide greater depth of personnel. If appropriate, movement to a long-term research position could be viewed as professional development.

Second, personnel responsible for formatting and processing raw data might be included on accounts. Through association with a particular group, people in this role would have a reasonable idea of analysts' requirements. This would allow the preselection and preparation of data, so that analysts could focus on "connecting the dots." The skills requirement for this role would be akin to those of a research librarian.

Third, tools to help the analyst identify, manage, and fuse relevant data could be identified and deployed. These tools, which need not be limited to those that are technology-based, should be used to support analysts' labor-intensive tasks, thereby freeing them to focus on the analysis of data.

Employ alternative methods for examining work processes. Just as we used alternative methods to examine the Iintelligence Cycle, and as managers press analysts to use alternative analyses in assessing their targets, so should managers employ alternative methods for examining work processes. These methods

should not simply test effectivenss; they should also identify vulnerabilities and potential sources of other problems in the community's analytical methods.

PART III

Potential Areas for Improvement

CHAPTER FIVE

Integrating Methodologists into Teams of Experts[1]

Intelligence analysis, like other complex tasks, demands considerable expertise. It requires individuals who can recognize patterns in large data sets, solve complex problems, and make predictions about future behavior or events. To perform these tasks successfully, analysts must dedicate years to researching specific topics, processes, and geographic regions.

Paradoxically, it is the specificity of expertise that makes expert forecasts unreliable. While experts outperform novices and machines in pattern recognition and problem solving, expert predictions of future behavior or events are seldom as accurate as Bayesian probabilities.[2] This is due, in part, to cognitive biases and processing-time constraints and, in part, to the nature of expertise itself and the process by which one becomes an expert.

Becoming an Expert

Expertise is commitment coupled with creativity. By this, I mean the commitment of time, energy, and resources to a relatively narrow field of study and the creative energy necessary to generate new knowledge in that field. It takes a great deal of time and regular exposure to a large number of cases to become an expert.

---

[1] A version of this chapter originally appeared as "Integrating Methodologists into Teams of Substantive Experts in *Studies in Intelligence* 47, no. 1 (2003): 57–65.

[2] Method for estimating the probability of a given outcome developed by Thomas Bayes (1702–61), an English mathematician. See Thomas Bayes, "An Essay Toward Solving a Problem In the Doctrine of Chances."

Entering a field of study as a novice, an individual needs to learn the heuristics and constraints—that is, the guiding principles and rules—of a given task in order to perform that task. Concurrently, the novice needs to be exposed to specific cases that test the reliability of such heuristics. Generally, novices find mentors to guide them through the process of acquiring new knowledge. A fairly simple example would be someone learning to play chess. The novice chess player seeks a mentor who can explain the object of the game, the number of spaces, the names of the pieces, the function of each piece, how each piece is moved, and the necessary conditions for winning or losing a game.

In time, and with much practice, the novice begins to recognize patterns of behavior within cases and, thus, becomes a journeyman. With more practice and exposure to increasingly complex cases, the journeyman finds patterns not only within but also among cases and, more important, learns that these patterns often repeat themselves. Throughout, the journeyman still maintains regular contact with a mentor to solve specific problems and to learn more complex strategies. Returning to the example of the chess player, the individual begins to learn patterns of opening moves, offensive and defensive strategies, and patterns of victory and defeat.

The next stage begins when a journeyman makes and tests hypotheses about future behavior based on past experiences. Once he creatively generates knowledge, rather than simply matching patterns, he becomes an expert. At this point, he becomes responsible for his own knowledge and no longer needs a mentor. In the chess example, once a journeyman begins competing against experts, makes predictions based on patterns, and tests those predictions against actual behavior, he is generating new knowledge and a deeper understanding of the game. He is creating his own cases rather than relying on the cases of others.

The chess example in the preceding paragraphs is a concise description of an apprenticeship model. Apprenticeship may seem to many a restrictive, old-fashioned mode of education, but it remains a standard method of training for many complex tasks. In fact, academic doctoral programs are based on an apprenticeship model, as are such fields as law, music, engineering, and medicine. Graduate students enter fields of study, find mentors, and begin the long process of becoming independent experts and generating new knowledge in their respective domains.

To some, playing chess may appear rather trivial when compared, for example, with making medical diagnoses, but both are highly complex tasks. Chess heuristics are well-defined, whereas medical diagnoses seem more open ended and variable. In both instances, however, there are tens of thousands of potential patterns. A research study discovered that chess masters had spent between 10,000 and 20,000 hours, or more than 10 years, studying and play-

ing chess. On average, a chess master acquires 50,000 different chess patterns.[3]

Similarly, a diagnostic radiologist spends eight years in full-time medical training - four years of medical school and four years of residency—before being qualified to take a national board exam and begin independent practice.[4] According to a 1988 study, the average diagnostic radiology resident sees 40 cases per day, or around 12,000 cases per year.[5] At the end of a residency, a diagnostic radiologist has acquired an average of 48,000 cases.

Psychologists and cognitive scientists agree that the time it takes to become an expert depends on the complexity of the task and the number of cases, or patterns, to which an individual is exposed. The more complex the task, the longer it takes to build expertise, or, more accurately, the longer it takes to experience a large number of cases or patterns.

The Power of Expertise

Experts are individuals with specialized knowledge suited to perform the specific tasks for which they are trained, but that expertise does not necessarily transfer to other domains.[6] A master chess player cannot apply chess expertise in a game of poker; although both chess and poker are games, a chess master who has never played poker is a novice poker player. Similarly, a biochemist is not qualified to perform neurosurgery, even though both biochemists and neurosurgeons study human physiology. In other words, the more complex a task, the more specialized and exclusive is the knowledge required to perform that task.

Experts perceive meaningful patterns in their domains better than do nonexperts. Where a novice perceives random or disconnected data points, an expert connects regular patterns within and among cases. This ability to identify patterns is not an innate perceptual skill; rather, it reflects the organization of knowledge after exposure to and experience with thousands of cases.[7]

Experts have a deeper understanding of their domains than do novices, and they utilize higher-order principles to solve problems.[8] A novice, for example, might group objects together by color or size, whereas an expert would group

---

the same objects according to their function or utility. Experts comprehend the meaning of data better than novices, and they weigh variables with different criteria within their domains better. Experts recognize variables that have the largest influence on a particular problem and focus their attention on those variables.

Experts have better domain-specific short-term and long-term memory than do novices.[9] Moreover, experts perform tasks in their domains faster than novices and commit fewer errors while solving problems.[10] Interestingly, experts also go about solving problems differently. At the beginning of a task, experts spend more time thinking about a problem than do novices, who immediately seek to find a solution.[11] Experts use their knowledge of previous cases as context for creating mental models to solve given problems.[12]

Because they are better at self-monitoring than novices, experts are more aware of instances where they have committed errors or failed to understand a problem.[13] They check their solutions more often and recognize when they are missing information necessary for solving a problem.[14] Experts are aware of the limits of their knowledge and apply their domain's heuristics to solve problems that fall outside of their experience base.

The Paradox of Expertise

The strengths of expertise can also be weaknesses.[15] Although one would expect experts to be good forecasters, they are not particularly good at it. Researchers have been testing the ability of experts to make forecasts since the 1930s.[16] The performance of experts has been tested against Bayesian probabilities to determine if they are better at making predictions than simple statistical models. Seventy years later, after more than 200 hundred experiments in different domains, it is clear that the answer is no.[17] Supplied with an equal amount of data about a particular case, Bayesian probability data are as

good as, or better than, an expert at making calls about the future. In fact, the expert does not tend to outperform the actuarial table, even if given more specific case information than is available to the statistical model.[18]

There are few exceptions to these research findings, but these are informative. When experts are given the results of the Bayesian probabilities, for example, they tend to score as well as the statistical model if they use the statistical information in making their own predictions.[19] In addition, if experts have privileged information that is not reflected in the statistical table, they will actually perform better than does the table. A classic example is the case of the judge's broken leg. Judge X has gone to the theater every Friday night for the past 10 years. Based on a Bayesian analysis, one would predict, with some certainty, that this Friday night would be no different. An expert knows, however, that the judge broke her leg Thursday afternoon and is expected to be in the hospital until Saturday. Knowing this key variable allows the expert to predict that the judge will not attend the theater this Friday.

Although having a single variable as the determining factor makes this case easy to grasp, analysis is seldom, if ever, this simple. Forecasting is a complex, interdisciplinary, dynamic, and multivariate task wherein many variables interact, weight and value change, and other variables are introduced or omitted.

During the past 30 years, researchers have categorized, experimented, and theorized about the cognitive aspects of forecasting and have sought to explain why experts are less accurate forecasters than statistical models. Despite such efforts, the literature shows little consensus regarding the causes or manifestations of human bias. Some have argued that experts, like all humans, are inconsistent when using mental models to make predictions. That is, the model an expert uses for predicting X in one month is different from the model used for predicting X in a later month, although precisely the same case and same data set are used in both instances.[20] A number of researchers point

to human biases to explain unreliable expert predictions.[21] There is general agreement that two types of bias exist:

- *Pattern bias*: looking for evidence that confirms rather than rejects a hypothesis and/or filling in—perhaps inadvertently—missing data with data from previous experiences;
- *Heuristic bias*: using inappropriate guidelines or rules to make predictions.

Paradoxically, the very method by which one becomes an expert explains why experts are much better than novices at describing, explaining, performing tasks, and solving problems within their domains but, with few exceptions, are worse at forecasting than are Bayesian probabilities based on historical, statistical models. A given domain has specific heuristics for performing tasks and solving problems, and these rules are a large part of what makes up expertise. In addition, experts need to acquire and store tens of thousands of cases in order to recognize patterns, generate and test hypotheses, and contribute to the collective knowledge within their fields. In other words, becoming an expert requires a significant number of years of viewing the world through the lens of one specific domain. This concentration gives the expert the power to recognize patterns, perform tasks, and solve problems, but it also focuses the expert's attention on one domain to the exclusion of others. It should come as little surprise, then, that an expert would have difficulty identifying and weighing variables in an interdisciplinary task, such as forecasting an adversary's intentions. Put differently, an expert may know his specific domain, such as economics or leadership analysis, quite thoroughly, but that may still not permit him to divine an adversary's intention, which the adversary may not himself know.

The Burden on Intelligence Analysts

Intelligence analysis is an amalgam of a number of highly specialized domains. Within each, experts are tasked with assembling, analyzing, assigning meaning to, and reporting on data, the goals being to describe an event or observation, solve a problem, or make a forecast. Experts who encounter a case outside their field repeat the steps they initially used to acquire their expertise. Thus, they can try to make the new data fit a pattern previously acquired; recognize that the case falls outside their expertise and turn to their domain's heuristics to try to give meaning to the data; acknowledge that the

[21] J. Evans, *Bias in Human Reasoning*; R. Heuer, *Psychology of Intelligence Analysis*; D. Kahneman, P. Slovic, and A. Tversky, *Judgment Under Uncertainty*; A. Tversky and D. Kahneman, "The Belief in the 'Law of Small Numbers'."

case still does not fit with their expertise and reject the data set as an anomaly; or consult other experts.

An item of information, in and of itself, is not domain specific. Imagine economic data that reveal that a country is investing in technological infrastructure, chemical supplies, and research and development. An economist might decide that the data fit an existing spending pattern and integrate these facts with prior knowledge about a country's economy. The same economist might decide that this is a new pattern that needs to be stored in long-term memory for some future use, or he might decide that the data are outliers of no consequence and may be ignored. Finally, the economist might decide that the data would be meaningful to a chemist or biologist and, therefore, seek to collaborate with other specialists, who might reach different conclusions regarding the data than would the economist.

In this example, the economist is required to use his economic expertise in all but the final option of consulting other experts. In the decision to seek collaboration, the economist is expected to know that what appears to be new economic data may have value to a chemist or biologist, domains with which he may have no experience. In other words, the economist is expected to know that an expert in some other field might find meaning in data that appear to be economic.

Three disparate variables complicate the economist's decisionmaking:

- *Time context*. This does not refer to the amount of time necessary to accomplish a task but rather to the limitations that come from being close to an event. The economist cannot say a priori that the new data set is *the* critical data set for some future event. In "real time," they are simply data to be manipulated. It is only in retrospect, or in long-term memory, that the economist can fit the data into a larger pattern, weigh their value, and assign them meaning.

- *Pattern bias*. In this particular example, the data have to do with infrastructure investment, and the expert is an economist. Thus, it makes perfect sense to try to manipulate the new data within the context of economics, recognizing, however, that there may be other, more important angles.

- *Heuristic bias*. The economist has spent a career becoming familiar with and using the guiding principles of economic analysis and, at best, has only a vague familiarity with other domains and their heuristics. An economist would not necessarily know that a chemist or biologist could identify what substance is being produced based on the types of equipment and supplies that are being purchased.

This example does not describe a complex problem; most people would recognize that the data from this case might be of value to other domains. It is one isolated case, viewed retrospectively, which could potentially affect two other domains. But, what if the economist had to deal with 100 data sets per day? Now, multiply those 100 data sets by the number of domains potentially interested in any given economic data set. Finally, put all of this in the context of "real time." The economic expert is now expected to maintain expertise in economics, which is a full-time endeavor, while simultaneously acquiring some level of experience in every other domain. Based on these expectations, the knowledge requirements for effective collaboration quickly exceed the capabilities of the individual expert.

The expert is left dealing with all of these data through the lens of his own expertise. Let's assume that he uses his domain heuristics to incorporate the data into an existing pattern, store the data in long-term memory as a new pattern, or reject the data set as an outlier. In each of these options, the data stop with the economist instead of being shared with an expert in some other domain. The fact that these data are not shared then becomes a potentially critical case of analytic error.[22]

In hindsight, critics will say that the implications were obvious—that the crisis could have been avoided if the data had been passed to one or another specific expert. In "real time," however, an expert often does not know which particular data set would have value for an expert in another domain.

The Pros and Cons of Teams

One obvious solution to the paradox of expertise is to assemble an interdisciplinary team. Why not simply make all problem areas or country-specific data available to a team of experts from a variety of domains? This ought, at least, to reduce the pattern and heuristic biases inherent in relying on only one domain. Ignoring potential security issues, there are practical problems with this approach. First, each expert would have to sift through large data sets to find data specific to his expertise. This would be inordinately time-consuming and might not even be routinely possible, given the priority accorded gisting and current reporting.

Second, during the act of scanning large data sets, the expert inevitably would be looking for data that fit within his area of expertise. Imagine a chemist who comes across data that show that a country is investing in technologi-

[22] L. Kirkpatrick, *Captains Without Eyes: Intelligence Failures in World War II*; F. Shiels, *Preventable Disasters*; J. Wirtz, *The Tet Offensive: Intelligence Failure in War*; R. Wohlstetter, *Pearl Harbor.*

cal infrastructure, chemical supplies, and research and development (the same data that the economist analyzed in the previous example). The chemist recognizes that these are the ingredients necessary for a nation to produce a specific chemical agent, which could have a military application or could be benign. The chemist then meshes the data with an existing pattern, stores the data as a new pattern, or ignores the data as an anomaly.

The chemist, however, has no frame of reference regarding spending trends in the country of interest. He does not know if the investment in chemical supplies represents an increase, a decrease, or a static spending pattern—answers the economist could supply immediately. There is no reason for the chemist to know if a country's ability to produce this chemical agent is a new phenomenon. Perhaps the country in question has been producing the chemical agent for years, and these data are part of some normal pattern of behavior.

If this analytic exercise is to begin to coalesce, neither expert must treat the data set as an anomaly and both must report it as significant. In addition, each expert's analysis of the data—an increase in spending and the identification of a specific chemical agent—must be brought together at some point. The problem is, at what point? Presumably, someone will get both of these reports somewhere along the intelligence chain. Of course, the individual who gets these reports will be subject to the same three complicating variables described earlier—time context, pattern bias, and heuristic bias—and may not be able to synthesize the information. Thus, the burden of putting the pieces together will merely have been shifted to someone else in the organization.

In order to avoid shifting the problem from one expert to another, an actual collaborative team could be built. Why not explicitly put the economist and the chemist together to work on analyzing data? The utilitarian problems with this strategy are obvious: not all economic problems are chemical, and not all chemical problems are economic. Each expert would waste an inordinate amount of time. Perhaps one case in 100 would be applicable to both experts, but, during the rest of the day, they would drift back to their individual domains, in part, because that is what they are best at and, in part, just to stay busy.

Closer to the real world, the same example may also have social, political, historical, and cultural aspects. Despite an increase in spending on a specific chemical agent, the country in question may not be inclined to use it in a threatening way. For example, there may be social data unavailable to the economist or the chemist indicating that the chemical agent will be used for a benign purpose. In order for collaboration to work, each team would have to have experts from many domains working together on the same data set.

Successful teams have very specific organizational and structural requirements. An effective team requires discrete and clearly stated goals that are

shared by each team member.[23] Teams also require interdependence and accountability, that is, the success of each individual depends on the success of the team as a whole as well as on the individual success of every other team member.[24]

Effective teams require cohesion, formal and informal communication, cooperation, shared mental models, and similar knowledge structures.[25] Putting combinations such as this in place is not a trivial task. Creating shared mental models may be fairly easy within an air crew or a tank crew, where an individual's role is clearly identifiable as part of a clearly-defined, repetitive team effort, such as landing a plane or acquiring and firing on a target. It is more difficult within an intelligence team, given the vague nature of the goals, the enormity of the task, and the diversity of individual expertise. Moreover, the larger the number of team members, the more difficult it is to generate cohesion, communication, and cooperation. Heterogeneity can also be a challenge; it has a positive effect on generating diverse viewpoints within a team, but it requires more organizational structure than does a homogeneous team.[26]

Without specific processes, organizing principles, and operational structures, interdisciplinary teams will quickly revert to being simply a room full of experts who ultimately drift back to their previous work patterns. That is, the experts will not be a team at all; they will be a group of experts individually working in some general problem space.[27]

Can Technology Help?

There are potential technological alternatives to multifaceted teams. For example, an Electronic Performance Support System (EPSS) is a large database that is used in conjunction with expert systems, intelligent agents, and decision aids.[28] Although applying such a system to intelligence problems might be a useful goal, at present, the notion of an integrated EPSS for large complex data sets is more theory than practice.[29] In addition to questions about the technological feasibility of such a system, there are fundamental epistemological challenges. It is virtually inconceivable that a comprehensive computational system could bypass the three complicating variables of expertise described earlier.

An EPSS, or any other computational solution, is designed, programmed, and implemented by a human expert from one domain only, that of computer science. Historians will not design the "historical decision aid," economists will not program the "economic intelligent agent," chemists will not create the "chemical agent expert system." Computer scientists may consult with various experts during the design phase of such a system, but, when it is time to sit down and write code, the programmer will follow the heuristics with which he is familiar.[30] In essence, one would be trading the heuristics of dozens of domains for those that govern computer science. This would reduce the problem of processing time by simplifying and linking data, and it might reduce pattern bias. It would not reduce heuristic bias, however; if anything, it might exaggerate it by reducing all data to a binary state.[31]

This skepticism is not simply a Luddite reaction to technology. Computational systems have had a remarkable, positive effect on processing time, storage, and retrieval. They have also demonstrated utility in identifying patterns within narrowly defined domains. However, intelligence analysis requires the expertise of so many diverse fields of study and is not something a computational system handles well. Although an EPSS, or some other form of computational system, may be a useful tool for manipulating data, it is not a solution to the paradox of expertise.

---

[28] An *Expert System* is a job-specific heuristic process that helps an expert narrow the range of available choices. An *Intelligent Agent* is an automated program (bot) with built-in heuristics used in Web searches. A *Decision Aid* is an expert system whose scope is limited to a particular task.

Analytic Methodologists

Most domains have specialists who study the scientific process or research methods of their discipline. Instead of specializing in a specific substantive topic, these experts specialize in mastering the research and analytic methods of their domain. In the biological and medical fields, these methodological specialists are epidemiologists. In education and public policy, they are program evaluators. In other fields, they are research methodologists or statisticians. Whatever the label, each field recognizes that it requires experts in methodology who focus on deriving meaning from data, recognizing patterns, and solving problems within a domain in order to maintain and pass on the domain's heuristics. They become in-house consultants—organizing agents—who work to identify research designs, methods for choosing samples, and tools for data analysis.

Because they have a different perspective than do the experts in a domain, methodologists are often called on by substantive experts to advise them on a variety of process issues. On any given day, an epidemiologist, for example, may be asked to consult on studies of the effects of alcoholism or the spread of a virus on a community or to review a double-blind clinical trial of a new pharmaceutical product. In each case, the epidemiologist is not being asked about the content of the study; rather, he is being asked to comment on the research methods and data analysis techniques used.

Although well over 160 analytic methods are available to intelligence analyst, few methods specific to the domain of intelligence analysis exist.[32] Intelligence analysis has few specialists whose professional training is in the process of employing and unifying the analytic practices within the field. It is left to the individual analysts to know how to apply methods, select one method over another, weigh disparate variables, and synthesize the results—the same analysts whose expertise is confined to specific substantive areas and their own domains' heuristics.

Conclusion

Intelligence agencies continue to experiment with the right composition, structure, and organization of analytic teams. Yet, although they budget significant resources for technological solutions, comparatively little is being

[32] Exceptions include: S. Feder, "FACTIONS and Policon"; R. Heuer, *Psychology of Intelligence Analysis*; R. Hopkins, *Warnings of Revolution: A Case Study of El Salvador*; J. Lockwood and K. Lockwood, "The Lockwood Analytical Method for Prediction (LAMP)"; J. Pierce, "Some Mathematical Methods for Intelligence Analysis"; E. Sapp, "Decision Trees"; J. Zlotnick, "Bayes' Theorem for Intelligence Analysis."

done to advance methodological science. Methodological improvements are left primarily to the individual domains, a practice that risks falling into the same paradoxical trap that currently exists. What is needed is an intelligence-centric approach to methodology that will include the methods and procedures of many domains and the development of heuristics and techniques unique to intelligence. In short, intelligence analysis needs its own analytic heuristics that are designed, developed, and tested by professional analytic methodologists.

The desired outcome would be a combined approach that includes formal thematic teams with structured organizational principles, technological systems designed with significant input from domain experts, and a cadre of analytic methodologists. These methodologists would act as in-house consultants for analytic teams, generate new methods specific to intelligence analysis, modify and improve existing methods of analysis, and promote the professionalization of the discipline of intelligence. Although, at first, developing a cadre of analytic methodologists would require using specialists from a variety of other domains and professional associations, in time, the discipline would mature into its own subdiscipline with its own measures of validity and reliability.

CHAPTER SIX

The Question of Foreign Cultures: Combating Ethnocentrism in Intelligence Analysis

The intelligence literature often cautions intelligence professionals to be wary of mirror imaging.[1] Although the term is a misnomer (a mirror image is a reverse image), the concept is that individuals perceive foreigners—both friends and adversaries of the United States—as thinking the same way as Americans.[2] Individuals do, in fact, have a natural tendency to assume that others think and perceive the world in the same way they do. This type of projective identification, or ethnocentrism, is the consequence of a combination of cognitive and cultural biases resulting from a lifetime of enculturation, culturally bound heuristics, and missing, or inadequate, information.[3]

Ethnocentrism is a phenomenon that operates on a conscious level, but it is difficult to recognize in oneself and equally difficult to counteract. In part, this is because, in cases of ethnocentric thinking, an individual does not recognize that important information is missing or, more important, that his worldview and problem-solving heuristics interfere with the process of recognizing information that conflicts or refutes his assumptions.

Take, for example, the proposition that others do not think like Americans. It seems only intuitive that other tribes, ethnic groups, nationalities, and states

---

[1] Alexander Butterfield, *The Accuracy of Intelligence Assessment;* Richards J. Heuer, Jr., *Psychology of Intelligence Analysis*; Lisa Krizan, *Intelligence Essentials for Everyone*; J. R. Thompson, R. Hopf-Weichel, and R. Geiselman, *The Cognitive Bases of Intelligence Analysis*.

[2] In this work, I use the broader term "ethnocentrism" to refer to the concept represented by mirror imaging and projective identification .

[3] In anthropology, ethnocentrism is the tendency to judge the customs of other societies by the standards of one's own culture. This includes projecting one's own cognition and norms onto others.

have different histories, languages, customs, educational practices, and cultures and, therefore, must think differently from one another.

The problem, however, is that the cognitive process of understanding or even recognizing that there are cultural and cognitive differences is not intuitive at all. Intuition is the act of immediate cognition, that is, perceiving something directly through the use of culturally dependent heuristics and cognitive patterns accumulated through a lifetime without requiring the use of rational or formal processes. This effort appears doomed to failure, because "trying to think like them" all too often results in applying the logic of one's own culture and experience to try to understand the actions of others, without knowing that one is using the logic of one's own culture. This, however, does not have to be the case. Through acculturation and the use of specific strategies, tools, and techniques, it is possible to combat the effects of ethnocentrism without trying to "think like them." This text includes two short case studies on failures to recognize ethnocentrism, both drawn from the author's own experience and told from his perspective. These failures are then examined with the goal of developing strategies and techniques to combat ethnocentric bias.

Case Study One: Tiananmen Square

At the time of the prodemocracy protests of the Chinese students and, to a lesser extent, workers, between April and June of 1989, I too was a college student. I mention this because American college students and Chinese college students tend to perceive themselves in very different ways, and they are perceived by their societies as having very different social roles. Chinese students perceive themselves as having moral authority, and they are perceived as controlling social capital and possessing public status. There is a cultural norm in China that students, as the future elite, have a morally superior role in society. I remember thinking at the time that, with the obvious exception of those in power, who risked losing their privileged positions, any "right-minded" person in China would support democracy. A movement for democratic reform would liberalize the policies of a repressive regime, encourage personal freedom, and give the Chinese people a voice in their lives.

When the university students went on strike and took over Tiananmen Square, the popular view in the United States, reflected in the US media, was that they were college students protesting for democratic reform. There were images of thousands of students rallying and camping out on and around the statue of the People's Heroes. Throughout the square, banners and posters from universities supported democracy and freedom. The statue of the Goddess of Democracy erected by the demonstrators looked very much like our Statue of Liberty. Labor groups offered to join the students, people paraded in front of the Great Hall of the People, and citizens donated blankets and food.

Student leaders began a hunger strike to force a dialogue between the students and the government. All signs seemed clearly to point to a popular movement for democracy, for which there was a groundswell of support.

The Chinese government seemed hesitant or unsure. The People's Liberation Army (PLA) was sent to surround the square, but citizens blocked their advance and tried to persuade the troops to be neutral. A curfew order was not obeyed; martial law was declared and ignored. Another PLA move on Tiananmen Square was repelled. It appeared that the students had forced a stalemate and that their demands would be heard.

At that point, my assumption was that the government was weakened and would be forced to respond to the protesters' demands, at least to some degree. I anticipated a dialogue and concessions on both sides. Although I imagined the government was capable of resorting to violence, I assumed that it would not. It seemed inconceivable that the citizens of Beijing—10–12 million people—would not intervene on behalf of the students. That many people could have overwhelmed the PLA had they chosen to do so. I also assumed that the soldiers of the PLA would be reluctant to fire on their own people, partly because the majority of both groups were from the same, dominant ethnic group of China, the Han, and, in part, because the soldiers represented a lower rung of Chinese society then did the students. The notion of soldiers killing students would be an affront to the sensibilities of the Han, or so I thought. I was wrong.

In the end, when the PLA carried out its orders to clear the square with force and end the protest, support for the protesters turned out to be relatively slight. The Chinese "middle class" never came to the students' aid; the great majority of the Beijing populace simply watched the events unfold. Moreover, it turned out that the labor groups participating in the demonstration were actually protesting against corporate corruption and the lack of job stability brought about by market reforms and not in support of the students' demands for a loosening of restrictions on expression. What I perceived to be a groundswell of popular support for the students had been exaggerated and wishful thinking on my part.

My failure to anticipate the way events would actual unfold in Tiananmen Square was tied to ethnocentric thinking and a lack of accurate and contextual information. Students in the United States are encouraged to be politically active, and their protests are often seen merely as minor inconveniences that need to be endured. In China, however, the protesting students were seen as a direct challenge to political authority and, much more so than in the United States, their actions were viewed as an outright conflict between the future elite and the current leadership. The protest itself was viewed as a violation of a taboo, upsetting the cultural order and the stability of society.

As an observer, I missed the cultural context that was necessary to view the events as an actual conflict and could not convince myself that a violent solution was a possibility. I had discounted the hypothesis that violence would occur, because I could not imagine it occurring in the United States. This led me to discount raw data that would have refuted a hypothesis that the two factions would reach a compromise. In addition, at that time, I had no formal grounding in Chinese studies, nor had I been to China. Thus, I had not acquired information that would have helped me create a meaningful context for the event.

Years later, my wife and I were in China doing ethnographic fieldwork on the socioeconomic effects of the spread of the English language and American culture in urban and rural China.[4] While there, we spent a great deal of time talking with others about the events of Tiananmen, and we decided to include in our research questions about the student protests, if for no other reason than to satisfy our own curiosity.

What we found stood in contrast to media reports and the opinions expressed by many pundits and scholars in the US and the West. After hundreds of interviews with a wide variety of people in and around Beijing, we found a consistent preoccupation among the "silent majority." That was the Cultural Revolution, which had affected all of the people we interviewed. They had been participants, observers, or survivors, and, often, all three.

In the mid-1960s, Mao Zedong sought to recapture power from reform-minded opponents within the Communist Party. Using radical party leaders as his instruments, he created the Red Guard, which was made up primarily of college students (although others followed suit in time). The image of the Cultural Revolution was not simply the image of Mao; it was also the image of angry, violent, and powerful college students, who were the most visible proponents of the "Cult of Mao." According to the people we interviewed, it was the students who had chanted slogans, raised banners, paraded in public spaces, resisted older forms of social control, and seized power. With that power and the blessings of Mao, the youth and university students had committed many of the atrocities of the Cultural Revolution and plunged China into a decade of chaos, during which many institutions, including schools, were closed and many of the country's cultural and historical artifacts were destroyed.

---

[4] American anthropology is based on the ethnographic method and direct interaction with the people who are being studied. This interaction includes direct and participant observation and interviews, or fieldwork, where one lives with the people being investigated. Continental European schools of anthropology are not as obsessed with methodology and hands-on experience and tend to the more theoretical.

At the height of the Cultural Revolution, any dissent was sufficient to bring accusations of counterrevolutionary sympathies and to qualify one for "re-education," which could mean public denunciation, job loss, incarceration, forced labor, relocation, and even murder, torture, and rape. The traditional values of respect and honor were replaced with violence and terror, and the historical social unit of the family had been disrupted and replaced with the cult of Mao.

For those who had lived through the Cultural Revolution, the student challenge to the government in Tiananmen in 1989 was also a challenge to social order and stability. The people we interviewed remembered, correctly or not, that the faction of the Communist Party then in power and the PLA had stopped the Red Guard and the Cultural Revolution, arrested its highest ranking proponents and beneficiaries, the Gang of Four, and eventually restored order to the nation. The point of view of the people we interviewed was that the PLA, despite the low social status of soldiers, had stopped the chaos. Although they did not approve of killing students, the threat of another cultural revolution, democratic or otherwise, was more disturbing to them than the bloody climax in the square. Social order was the higher virtue.

Tiananmen Square: Discussion

> *We cut nature up, organize it into concepts, and ascribe significances as we do, largely because we are parties to an agreement to organize it in this way—an agreement that holds throughout our speech community and is codified in the patterns of our language.*
>
> Benjamin Whorf[5]

In 1987, a Chinese academic, Min Qi, performed the first national survey of Chinese political culture.[6] Respondents were asked, among other things, to select statements that best described their understanding of democracy. Of the 1,373 respondents, 6.6 percent responded that democracy meant that people could elect their political leaders and 3.4 percent that power was limited and divided. These replies tended to be from individuals under 25 years of age, in college, and living in urban centers.

---

[5] Benjamin Whorf, along with fellow anthropologist Edward Sapir, developed the linguistic relativity hypothesis, asserting that different speech communities had different patterns of thought. Although challenged by linguist/philosopher Noam Chomsky and others with the Universal Grammar hypothesis, linguistic relativity still has a significant amount of empirical research support. Benjamin Whorf, *Language, Thought, and Reality.*

[6] Min Qi, *Zhongguo Zhengzhi Wenhua* [Chinese Political Culture]. Translation courtesy of a friend of the author who prefers to remain anonymous.

In contrast, 25 percent responded that democracy was guided by the center (the party and the cadres), 19.5 percent that democracy meant that the government would solicit people's opinions (the party would ask people what they thought), and 11 percent that democracy meant the government would make decisions for the people based on the people's interests but not including the people's direct vote. These three responses were more in line with then-current party doctrine and tended to be from individuals over 36 years of age living in both urban and rural settings. This was the same demographic that experienced the Cultural Revolution.

The election of representatives and the division and limitation of those representatives' power—what I would have considered to be two key aspects of democracy—were chosen by 10 percent of the sample, only slightly larger than the 6.3 percent of Chinese respondents who reported that they didn't know what the word "democracy" meant. My own perception of democracy fit with a young, urban, elite, college educated population, not with the majority of Chinese citizens.

There was a very small sample of citizens in Tiananmen Square demanding what looked and sounded like my American version of democracy. Yet, however much the students' message resonated in the West, it did not do so in China. My expectations notwithstanding, there was a cognitive disconnect between students and average citizens, which, along with the visceral semiotics of the Cultural Revolution, kept the two apart.[7] It was not just the message that had kept people in their homes during the PLA siege on Tiananmen; it was also the messengers.

The label "ethnocentrism" might be accurate, but it does not diagnose the root of the problem. I did not use a variety of tools or techniques to question my underlying assumptions and, therefore, I failed to make an accurate forecast. There were obvious statistical and analytic flaws. The former was principally a sampling error, both frame and selection bias (the students at Tiananmen did not represent the general population in Beijing or China at large). More significant than simple technical or statistical flaws, however, my frame of reference and my assumptions about meanings, context, and values (or culture) misled me.

The assumptions I made about the Tiananmen protests were products of my own enculturation, and I am not convinced that anything short of the experience of analytic failure would have been sufficient for me to examine the process underpinning my reasoning. I never would have reexamined my mental mode without experiencing failure. Failure is an event that is easily remem-

[7] Semiosis is the production of cultural signifiers or signs and the cultural or contextual meaning of those signs. This includes all modes of visual and auditory production.

bered; it affects the ego and drives one to investigate errors and to adapt or change behavior based on those investigations. Failure is a learning event and results in a teachable moment.[8]

There seems to be little reason to perform a postmortem when events unfold as predicted. The natural assumption is that the mechanisms of analysis were valid, because the results of the analysis were accurate. The obvious danger is that this assumption discounts the possibility that one may be accurate purely by accident. Moreover, by focusing only on failure, one risks sampling bias by only choosing cases in which there was error. The risk of ignoring success is that potential lessons may go undiscovered. An alternative to relying on failure to challenge one's assumptions is to create a standard practice of reviewing each case regardless of outcome, principally through the use of a formal After Action Review (AAR).

Case Study Two: The Red Team

Recently, I was asked to serve on a newly formed red team within the Department of Defense. I agreed to participate, despite a number of serious concerns having to do both with the nature and structure of red teams in general and with my own experience with ethnocentrism and its effects on analysis. These concerns are applicable not only to red teams, but also to any analyst put in the position of trying to "think like them."[9]

This particular red team was part of a constructive/conceptual war game in which there were 11 participants, seven of whom had doctorates. Of the seven doctorates, three were psychologists, one was a historian, one was an economist, one was a political scientist, and one was an anthropologist. The other four participants had extensive military backgrounds. There were no physical scientists or engineers. Nine of the 11 participants were white males, one was a male born in the region of interest, and one was a white female. All were middle class. Seven of the 11 were raised in nominally Christian homes and three in nominally Jewish homes. (I say nominally because it was not possible to determine their level of religious commitment during this exercise.)

I mention the demographics of the group because it was not representative of the adversary we were intended to simulate. Although the group had

---

[8] Charles Perrow, *Normal Accidents.*

[9] Military red teams are meant to simulate the actions of an adversary in some type of war game or crisis simulation, usually with the goal of generating scenarios for training and readiness or for logistics and planning. These war games may be *live*, e.g., force-on-force simulations like those of the US Army Combat Training Centers; *virtual*, as in flight simulators; or *constructive*, either digital theater-level simulations or purely conceptual games centered on strategic, tactical, or operational issues.

numerous domain matter experts, very few had first-hand knowledge of the region of interest. Only one participant was from the area, had spent formative years there, spoke the languages, and experienced the culture firsthand. As this group was assembled to simulate the behavior and decisionmaking of a foreign adversary, this aspect was more important than it would have been for a substantive team developing threat assessments around a specific topic or target. Consequently, the scenarios developed by the red team often reflected an adversary whose behavior and decisionmaking resembled those of educated, white, middle class Americans.

The one member of the red team who had been born in and spent formative years in the region of interest regularly stopped the scenario development process by saying, "They wouldn't do that" or "They don't think that way." On several occasions, he objected, "This scenario is way too complex" or "They wouldn't use that tactic; it requires too much direct communication." His objections were not usually based on military considerations; rather, they were based on the cultural norms and mores of the adversary. He talked of kinship relationships as a specific type of social network in the region and of the value of kinship for understanding the adversary's intentions. In short, he brought an ethnographic perspective to the exercise.

Having no personal or professional experience with this region or its cultures, I thought it appropriate to defer to his first-person experience. Ultimately, however, it proved difficult to convince the group that this man's cultural knowledge was, in fact, an area of specialized knowledge that needed to be factored into each scenario. This difficulty was born out of another type of ethnocentric bias.

Inviting an anthropologist to a red team exercise presupposes that the red team takes seriously the notion that cultural differences matter and that those cultural factors ought to be made explicit in the analytic process. The problem in this case was that the anthropologist was not an area expert for this region and its cultures, and the one area expert who was there lacked the academic credentials to be taken seriously by the other members of the group. Had I been able to assert the same concepts that the other individual asserted, it would have had a certain academic, or scientific, imprimatur because of my training and experience. Because he lacked these credentials, many of the other individual's insights were lost, and the analytic product suffered as a result.

The Red Team: Discussion

I am reluctant to fault the organizers for the ethnocentric bias in the demographic composition of the red team. It is very difficult to assemble a truly

representative red team. There is the obvious problem of security. Someone fully able to represent the adversary culturally would very likely be unable to obtain requisite clearances for participation in a classified red team exercise. In fact, even if it were possible to find someone both culturally representative *and* sympathetic to the goals of the red team, such as the participant born in the region, the conflicts triggered by that sympathy, cultural identity, and cultural allegiance could well lead to unforeseen cognitive biases that would be difficult to counteract.[10]

An alternative is to find an ethnic American citizen with similarities to the people of the region of interest, but simply finding a US citizen with the same ethnicity as those of the region of interest does not guarantee any special insight into their thinking. Ethnicity is not the same as sharing culture or identity. Not all ethnic groups in the US are isolated and self-perpetuating. Many, in fact, put great effort into trying to assimilate into the larger "American culture" by distancing themselves from their culture of origin. These people often struggle with their own concept of cultural identity and the broader issues of community affiliation.[11] Many immigrants and most first-generation offspring have already begun the process of acculturation. More striking, their offspring display a process of enculturation in the US by learning the language, attending the schools, assimilating local and national values, and establishing ties to a diverse community outside of their own ethnic enclave. In fact, the children of recent immigrants share many of the same cognitive filters as those who are generations removed from migration. That said, there are American citizens born in the region of interest, like the member of the red team in which I participated, who do have insight into specific cultures, principally because their enculturation was affected by being born in, and living in, a foreign region.

The participant in that red team was a foreign-born American citizen, but foreign birth is not a necessary condition for enculturation.[12] Living in a foreign region, speaking the language, interacting with the people, developing community ties, and establishing an identity within that community are all part of the acculturation process and allow one to alter the cognitive filters through which one interprets the world. Time spent on a US military base, in a US embassy, or in a Western hotel overseas does not lead to acculturation.

[11] David Levinson and Melvin Ember, *American Immigrant Cultures*. For raw data covering 186 cultural groups since 1937, including immigrants, see the Human Relations Area Files at Yale University.

[12] Some anthropologists have argued that enculturation is specific to childhood but the evidence supports that it is a lifelong process. See Segall.

Quite the contrary, each of these is a "virtual" America, an approximation of life in the United States on some foreign soil, and it is the time spent away from these institutions that is important.

The red team experience reinforced lessons I learned from my own analytic failures and biases. Watching the struggle between the man enculturated in the region of interest and the academic experts was a frustrating experience. It was clear that the experts would not, or could not, hear what he was saying and that neither he nor I knew how to get the other experts to listen. I doubt this communication failure was the result of stubbornness or arrogance on anyone's part. It seemed rather that the experts' thinking naturally defaulted to their own cultural reference points, which interfered with his attempts to communicate his cultural knowledge.

Specific cultural knowledge is a skill and the foundation for forecasting the behavior and decisionmaking of foreign actors. Acquiring cultural knowledge should be taken as seriously as learning any other facet of one's analytic capabilities. Moreover, it is incumbent on analysts to educate their own leadership and policymakers about the value and utility of cultural knowledge for intelligence analysis.

Conclusion and Recommendations

Ethnocentrism is a normal condition, and it results in analytic bias. The analytic community and intelligence researchers need to develop tools and techniques to combat analytic ethnocentrism. I believe that using cultural diversity as a strategy to combat ethnocentrism has much to recommend it.[13]

Security concerns may make it very difficult, if not impossible, to hire people who are genuinely representative of a given culture. As an alternative to focusing on hiring practices, I recommend a formal cultural training program to facilitate acculturation. The program would include language acquisition and a classroom segment centered on specific cultures, but it would go beyond these by having the students go to countries of interest and interact with the

[13] Some social action groups have appropriated the words "cultural diversity" from Levi-Strauss and the French school of structural anthropology as a rallying cry to advance an agenda of equal access to resources and power. That is, the concept has been politicized, and, invoking the words "cultural diversity" in a public forum ensures that people will have some emotional reaction. This is not my intention. The use of the words in this work is meant strictly in the technical sense, specifically, that is, to refer to individuals whose enculturation occurs among different cultures or individuals who have experienced acculturation. Acculturation is not specific to any one group, all people can and do experience acculturation to one degree or another through cultural contact and cultural diffusion, defined as the spreading of a cultural trait (e.g., material object, idea, or behavior pattern) from one society to another without wholesale dislocation or migration. Moreover, acculturation can be accomplished purposefully through training and fieldwork.

people in their own setting and on their own terms. Students would be encouraged to investigate the rituals, norms, taboos, kinship systems, and social networks of the cultures being studied. There would also be provision for continuing on-line education and an on-line community of practice for mentoring, problem solving, and peer-to-peer interaction.

In my view, a stand-alone training program would be insufficient to affect analytic processes without specific follow-on programs. Retention of training requires repetition, problem solving, application, and evaluation. People must use what they learn and then determine if what they have learned can improve the quality of their work. To this end, I recommend a formal After Action Review (AAR) process.

The AAR is used by the US Army to capture lessons learned after a training exercise or a live operation. Unlike conventional postmortems and traditional performance critiques, the AAR is used to evaluate successes as well as failures. Although failure generally receives more scrutiny and attention than success, an approach that only examines failure results in sampling error. If one only scrutinizes mistakes, otherwise effective methods may be blamed for the errors. That those techniques were successful in 99 out of 100 cases can go unnoticed, with the result that the failures receive disproportionate attention and bias the statistical results of the postmortem. The AAR was specifically designed to avoid this problem.

The AAR process was introduced in the mid 1970s, but it is based on the oral history method of "after combat interviews" employed by S.L.A. Marshall during World War II, the Korean War, and the Vietnam War. As soon as possible after a battle, regardless of the outcome, Marshall would assemble soldiers who were involved and, using a semistructured interview technique, would engage them in a group discussion about their individual and team roles and actions during combat.

The current AAR method also includes such objective data as tactics, logistics, kill ratios, time-to-task, accuracy-of-task, and operational outcomes.[14] Informed by the objective data, a group discussion led by a facilitator trained in the elicitation process ensues. The AAR, along with supporting documents, such as historical studies and relevant doctrinal materials, is then stored in a knowledge repository at the US Army's Center for Army Lessons Learned (CALL).[15]

With some customization, an AAR process and a lessons learned repository could be created for intelligence analysts. Although seemingly time-consuming and cumbersome, with training and expert facilitators, the AAR process could be modified and streamlined for use by analysts at the end of a production cycle. As

---

[14] John Morrison and Larry Meliza, *Foundations of the After Action Review Process*.

a practical matter, the process would be used mostly with longer works, such as assessments or estimates. The intelligence product, along with AAR notes, would then be incorporated in a community knowledge repository. This knowledge repository would also help in the development and refinement of advanced analytic courses by providing course developers with baseline analytic data. In short, the repository becomes a tool for continuous educational needs analysis and links training directly to the actual work practices of analysts. These data can be used as a test bed for research on the effectiveness of analytic methodology. In this way, the lessons learned are not lost to future generations of analysts.

[15] See the US Army Center for Army Lessons Learned Web site, which has links to numerous other repositories. Although each organization has customized the concept to meet its unique needs, all of the US military services, the National Aeronautics and Space Administration, the Department of Energy, the Environmental Protection Agency, the North Atlantic Treaty Organization, the United Nations, and the ministries of defense of Australia and Canada, currently have Lessons Learned repositories.

CHAPTER SEVEN

Instructional Technology: Effectiveness and Implications for the Intelligence Community

J. D. Fletcher[1]
Rob Johnston

The Intelligence Community has begun to invest substantial resources in the training and education of its analysts. With the exception of a few advanced courses available through distance learning networks, this instruction is delivered using a conventional classroom model. This model possesses a number of inherent inefficiencies, including inconsistent instruction, strict ties to time and place of instruction, large student-to-instructor ratios, and limited active participation by students due to class size and scheduling.

Research suggests that significant improvements can be achieved through the use of computer-based instructional technology. According to these studies, this technology can increase instructional effectiveness and reduce time needed to learn. It can achieve these efficiencies, moreover, while both lowering the cost of instruction and increasing its availability.[2] This chapter summarizes evidence on the promise of instructional technology for intelligence analysis training.

---

[1] Dr. J. D. Fletcher is a research staff member at the Institute for Defense Analyses, where he specializes in issues of manpower, personnel, and training. He holds graduate degrees in computer science and educational psychology from Stanford University.

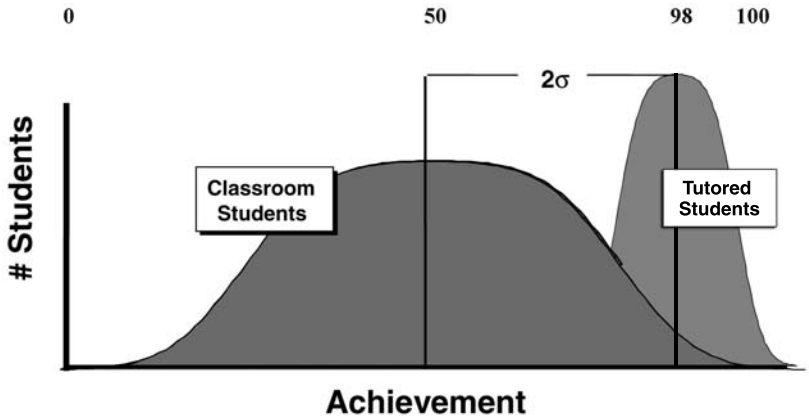
[2] Because instructional technology makes few distinctions between formal education and professional training, the term "instruction" will be used for both in this chapter.

Background

The argument for the use of instructional technology usually begins with a comparative examination of the effectiveness of classroom instruction and individual tutoring. For instance, the graph below illustrates the combined findings of three dissertation studies that compared one-on-one tutoring with one-on-many classroom instruction.[3]

It is not surprising that such comparisons would show that tutored students learned more than those taught in classrooms. What is surprising is the magnitude of the difference. Overall, as the figure shows, it was two standard deviations. This finding means, for example, that with instructional time held fairly constant one-on-one tutoring raised the performance of 50th percentile students to that of 98th percentile students. These, and similar empirical research findings, suggest that differences between one-on-one tutoring and typical classroom instruction are not only likely, but also very large.

Individual Tutoring Compared to Classroom Instruction



Why then do we not provide these benefits to all students? The answer is straightforward and obvious. With the exception of a few critical skills, such as aircraft piloting and surgery, we cannot afford it. One-on-one tutoring has been described as an educational imperative and an economic impossibility.[4]

---

[3] Benjamin S. Bloom, "The 2 Sigma Problem: The Search for Methods of Group Instruction as Effective as One-to-One Tutoring." The dissertation studies were performed under Bloom's direction.

[4] M. Scriven, "Problems and Prospects for Individualization."

The success of one-on-one tutoring may be explained by two factors. First, measured in terms of questions asked and answered, tutors and their students engage in many more instructional interactions per unit of time than is possible in a classroom. Second, one-on-one tutoring can overcome the substantial spread of ability, measured by the time needed to reach minimal proficiency, that is found in practically every classroom. Tutoring reduces time-to-learn by adapting each interaction to the needs of each student. Less time is spent on material the student has already learned, and more time is spent on material remaining to be mastered.

To investigate the intensity of instructional interactions, Art Graesser and Natalie Person compared questioning and answering in classrooms with those in tutorial settings.[5] They found that classroom groups of students ask about three questions an hour and that any single student in a classroom asks about 0.11 questions per hour. In contrast, they found that students in individual tutorial sessions asked 20–30 questions an hour and were required to answer 117–146 questions per hour. Reviews of the intensity of interaction that occurs in technology-based instruction have found even more active student response levels.[6]

Differences in the time needed by individuals in any classroom to meet instructional objectives are also substantial. Studies on this issue have reported ratios varying from 1:3 to 1:7 in the times the fastest learners need to learn compared to the times needed by the slowest learners. Although these differences may be due initially to ability, these studies suggest that such ability is quickly overtaken by prior knowledge of the subject matter.[7] This effect is particularly evident in instruction for post-secondary-school students, because prior knowledge rapidly increases with age and experience. Technology-based instruction has long been recognized for its ability to adjust the pace of instruction to individual needs, advancing through instructional material as quickly or as slowly as required. The overall result has been substantial savings in the time required to meet given instructional objectives.[8]

It should be emphasized that these benefits are not achieved at the expense of instructional quality. Research has found that many instructional technologies have a positive impact on learning across a wide variety of student populations, settings, and instructional subject matters.[9]

This research suggests that technology-based instruction results in substantial savings of time and money. Studies have shown that the times saved aver-

age about 30 percent, as seen in the table below. The reduction in overhead expenses averages 20–30 percent.[10] Research has shown that the cost ratios (calculated as the ratio of experimental intervention costs over the costs of a control group) for interactive multimedia technology (computer-based instruction with enhanced audio, graphics, and/or video; CD-ROM and DVD-based instruction; interactive video, etc.) favor it over conventional instruction along with time savings of about 31 percent.[11] Simulation of such systems as helicopters, tanks, and command-control systems for training combat skills has also proven to be cost-effective.[12] The operational costs for simulation are, on average, 10 percent of the costs of using the actual systems to train.[13]

Meta-analysis Demonstrates the Effectiveness of Instructional Technology

Researchers often use a meta-analytic approach to review and synthesize quantitative research studies on a variety of issues, including instructional effectiveness.[14] This method involves a three-step process, which begins with the collection of studies relevant to the issue using clearly defined procedures that can be replicated. Next, a quantitative measure, "effect size," is used to tabulate the outcomes of all the collected studies, including those with results that are not statistically significant. Finally, statistical procedures are used to

synthesize the quantitative measures and describe the findings of the analysis. Meta-analysis appears to be especially suited for synthesizing the results of instructional research, and it has been widely used for this purpose since its introduction in 1976.

Meta-analysis is still being developed as a technique, and some matters concerning its use, notably the "file-drawer" problem and calculation of effect size, remain unsettled. Chapter Twelve presents a more detailed explanation and these considerations. Briefly, however, meta-analytic reviews of instructional technology effectiveness have found substantial results favoring its use over traditional technologies of classroom instruction.

Overall, effect sizes for post-secondary school instruction average about 0.42, which is roughly equivalent to raising the achievement of 50th percentile students to that of 66th percentile students.[15] Reviews of more elaborate forms of instructional technology, such as those using applied artificial intelligent techniques, have found effect sizes in excess of 1.0, which is roughly equivalent to raising the achievement of 50th percentile students to that of the 84th percentile.[16] It seems reasonable to conclude that the reduced costs and reduced time to learn obtained in applications of instructional technology are not achieved at the expense of instructional effectiveness.

Encouraging as these favorable results are, our ability to apply instructional technology efficiently may be in its infancy. Findings thus far have been based on instructional applications intended to teach facts (e.g., What is the capital of Brazil? What is the Spanish word for chapel? Who was the first director of the Central Intelligence Agency?) concepts (e.g., What is a mass spectrometer used for? What is the difference between micro- and macro-economics? When must you use a torque wrench?), and procedures (e.g., How do you record a movie from television? How do you prepare a purchase requisition? How do you calibrate a radar repeater?). All intelligence analysts must possess a repertoire of facts, concepts, and procedures to perform their craft, and instructional technology holds great promise for increasing both the efficiency with which they might develop this repertoire and their access to instructional resources for doing so.

However, the capabilities analysts may seek through instruction are likely to include more abstract, or "higher," cognitive processes. For instance, in addition to learning a procedure, analysts may need the capability to recognize

the procedure's applicability in unfamiliar situations, modify it as needed, and use it to develop new approaches and procedures. Early on, Bloom discussed learning objectives as a hierarchy beginning with knowledge at the most rudimentary level and ascending through comprehension, application, analysis, and synthesis to evaluation.[17] Bloom's is not the only such hierarchy to emerge from research on instructional design, but it seems to be the best known, and it describes as well as any the various levels of knowledge, skill, and ability to which learners may aspire.

Current Research on Higher Cognitive Abilities

Analysts have begun to discuss development of the higher cognitive abilities needed to deal with unanticipated and novel challenges.[18] Components of such "cognitive readiness" may include:

- *Situation awareness*—the ability to comprehend the relevant aspects of a situation and use this understanding to choose reasonable courses of action.[19] Practice and feedback in complex, simulated environments have been shown to improve situation awareness.
- *Memory*—the ability to recall and/or recognize patterns in a situation that lead to likely solutions. It may be supported by two underlying theoretical mechanisms: *encoding specificity,*[20] which stresses the importance of responding to relevant external and internal perceptual cues, and *transfer-appropriate processing,*[21] which stresses the actions performed during encoding and retrieval. Some instructional techniques, such as overlearning,[22] have been shown to enhance long-term retention.[23]
- *Transfer*—the ability to apply what is learned in one context to a different context. It can be perceived either as the ability to select and apply procedural knowledge gained in one context to another ("low road" transfer) or as the ability to apply the principles abstracted from a set of contexts to another ("high road" transfer).[24] Extensive practice, with feedback, will

[23] R. A. Wisher, M. A. Sabol, and J. A. Ellis *Staying Sharp: Retention of Military Knowledge and Skills*.

enhance the former. Instruction in developing mental abstractions will enhance the latter.

- *Metacognition*—the executive functions of thought, more specifically, those needed to monitor, assess, and regulate one's own cognitive processes.[25] Meta-cognitive skills can be enhanced by exercises designed to increase awareness of self-regulatory processes.[26]
- *Pattern Recognition*—the ability to distinguish the familiar from the unfamiliar. It may be accomplished by "template matching," which involves comparing retained images with incoming sensory impressions; or by "feature comparison," which involves recognizing and generalizing from distinctive features of a structure held in memory with incoming sensory impressions.[27] Pattern recognition can be taught through a combination of extensive practice, with feedback, and instruction in forming abstractions.
- *Automaticity*—processes that require only limited conscious attention.[28] Automaticity can be taught by providing extensive practice, with feedback.
- *Problem Solving*—the ability to analyze a situation and identify a goal or goals that flow from it, identify tasks and subtasks leading to the goal, develop a plan to achieve them, and apply the resources needed to carry out the plan. Practice, with feedback, and overlearning can enhance problem-solving ability in many tasks. Techniques for problem solving can be successfully taught, as can the knowledge base needed to implement them.[29]
- *Decisionmaking*—a component of problem solving, but the emphasis in decisionmaking is on recognizing learned patterns, reviewing courses of action, assessing their impact, selecting one, and allocating resources to it.[30] Instruction in assessing courses of action has been shown to improve decisionmaking, but some aspects of successful decisionmaking are more likely to be inborn than trained.
- *Mental Flexibility and Creativity*—the ability to generate and modify courses of action rapidly in response to changing circumstances.[31] It

includes the ability to devise plans and actions that differ from and improve upon "school solutions." Capabilities that widen the range of options can be taught, but higher levels of creativity are more likely to be inborn than trained.

The above review suggests, first, that the creative processes needed by analysts can, to some extent, be broken down into components, and second, that these components can, again to some extent, be taught. Instructional technology can now substantially aid analysts in acquiring the facts, concepts, and procedures needed to perform their craft. However, it must become increasingly "intelligent" if it is to compress the years of experience analysts now need to become proficient and help them more rapidly acquire the advanced cognitive capabilities—those higher in Bloom's hierarchy—that they also need. To do this successfully, instruction must be tailored to the specific background, abilities, goals, and interests of the individual student or user. Instructional technology must provide what has been called "articulate expertise." Not only must it supply helpful and relevant guidance in these more advanced levels of knowledge, skills, and abilities, it must do so in a way that learners and users with varying levels of knowledge and skill can understand.

Discussion

At this point, it may be worth reviewing the capabilities provided by "non-intelligent" instructional technology since the 1950s. It has been able to:[32]

- accommodate the rate of progress of individual students, allowing as much or as little time as each needs to reach instructional objectives;
- tailor both the content and the sequence of instructional content to each student's needs;[33]
- make the instruction easy or difficult, specific or abstract, applied or theoretical as necessary;
- adjust to students' most efficient learning styles (collaborative or individual, verbal or visual, etc.).

Intelligent tutoring systems are a different matter. They require quite specific capabilities that were first targeted in the 1960s.[34] Two key capabilities are that intelligent tutoring systems must:

---

[32] E. Galanter, *Automatic Teaching*; R. C. Atkinson and H. A. Wilson, *Computer-Assisted Instruction*; P. Suppes and M. Morningstar, *Computer-assisted Instruction at Stanford 1966-68*; J. D. Fletcher and M. R. Rockway, "Computer-based Training in the Military."

[33] J. S. Brown, R. R. Burton, and J. DeKleer, "Pedagogical, Natural Language and Knowledge Engineering in SOPHIE I, II, and III."

- allow either the system or the student to ask open-ended questions and initiate instructional, "mixed-initiative" dialogue as needed or desired;
- generate instructional material and interactions on demand instead of requiring developers to foresee and store all the materials and interactions needed to meet all possible eventualities.

Mixed-initiative dialogue requires a language for information retrieval, tools to assist decisionmaking, and instruction that is shared by both the system and the student/user. The system must have the capability (referred to as "generative capability") to devise, on demand, interactions with students that do not rely on predicted and prestored formats. This capability involves more than generating problems tailored to each student's needs. It must also provide the interactions and presentations that simulate one-on-one tutorial instruction, including coaching, hints, and critiques of completed solutions.

Cost containment is one motivation for wanting to generate responses to all possible student states and actions instead of attempting to anticipate and store them. Another arises from basic research on human learning, memory, perception, and cognition. As documented by Neisser among others, during the 1960s and 1970s, the emphasis in basic research on human behavior and on the way in which it is understood shifted from the strict logical positivism of behavioral psychology, which focused on directly observable actions, to consideration of the internal, cognitive processes that were needed to explain empirically observed behavioral phenomena and are assumed to mediate and enable human learning.[35]

The hallmark of this approach is the view that seeing, hearing, and remembering are all acts of *construction,* making more or less use of the limited stimulus information provided by our perceptual capabilities. Constructivist approaches are the subject of much current and relevant discussion in instructional research circles, but they are firmly grounded in the foundations of scientific psychology.[36] For instance, in 1890, William James stated his General Law of Perception: "Whilst part of what we perceive comes through our senses from the object before us, another part (and it may be the larger part) always comes out of our mind."[37]

In this sense, the generative capability sought by intelligent instructional systems is not merely something nice to have. It is essential if we are to

[37] William James, *Principles of Psychology: Volume I.*

advance beyond the constraints of the prescribed, prebranched, programmed learning and ad hoc principles commonly used to design technology-based instruction. The long-term vision is that training, education, and performance improvement will take the form of human-computer conversations.

There has been progress toward this end. This conversational capability has been realized in systems that can discuss issues with students using a formal language, such as computer programming or propositional calculus.[38] More recent research suggests that significantly improved natural-language dialogue capabilities can be achieved by instructional technology.[39] Such an interactive, generative capability is needed if we are to deal successfully with the extent, variety, and mutability of human cognition. Much can now be accomplished by instructional technology, but much more can be expected.

Conclusion

The research discussed above suggests that instructional technology can:

- reduce costs of instruction;
- increase the accessibility of instruction;
- increase instructional effectiveness for analysts;
- reduce the time analysts need to learn facts, concepts, and procedures;
- track progress and ensure that all learners achieve instructional targets;
- provide opportunities for helping analysts to compress experience and achieve the higher cognitive levels of mastery demanded by their craft.

In addition, the findings suggest a rule of "thirds." This rule posits that the present state-of-the-art in instructional technologies can reduce the cost of instruction by about a third and *either* increase achievement by about a third *or* decrease time to reach instructional objectives by a third. Eventually, instructional technology should provide a conversation between the analyst and the technology that will tailor instruction in real time and on demand to the particular knowledge, skills, abilities, interests, goals, and needs of each individual. This capability, now available in rudimentary forms, can be expected to improve and develop with time. Even in its current state of development, however, instructional technology deserves serious attention within the Intelligence Community.

CHAPTER EIGHT

Organizational Culture: Anticipatory Socialization and Intelligence Analysts

Stephen H. Konya[1]
Rob Johnston

I know it sounds silly, but I had this image of James Bond before I started working here. The truth is, I just sit in a cubicle, and I write reports.

Every organization has a unique culture that is defined partly by its individual members and partly by its structure, history, and policies. For that culture to endure, it must be transmitted from current members to new members. This process, known as organizational socialization, is especially important in organizations with strong, insular cultures, as those with weak cultures have less to transmit and will tend to experience culture changes as members come and go.

Although socialization begins prior to a person's first day on the job and is a continuous process, it is experienced most intensely by new employees. The cultural symbols acquired and interpreted during their initial interaction with the institution create potent and lasting impressions.[2] For them, socialization

---

is the process of learning the ropes; training; and becoming formally and informally acquainted with what is actually of value within the organization.[3] It is also the time when one learns the organization's norms and taboos and the extent of its social capital.[4] In sum, formal and informal socialization are types of control mechanism for maintaining the norms, or status quo, within any organization.[5]

Organizational Socialization

According to Daniel Feldman, organizational socialization is "the process through which individuals are transformed from outsiders to participating, effective members of an organization."[6] As shown in Figure 1, Feldman divides this process into three stages: getting in (or anticipatory socialization), breaking in (or accommodation), and settling in (often referred to as role management). During the getting-in stage, potential employees try to acquire information about an organization from available sources, such as Web sites, professional journals, and corporate annual reports. The breaking-in stage includes orientation and learning organizational as well as job-related proce-

Feldman's three stages of organizational socialization.

dures. The settling-in stage concludes when an individual attains full member status in the organization.

While each of the three stages of socialization is important, the focus of this chapter is on the first, or anticipatory, stage. There are several reasons for this. Clearly, the expectations people develop about an organization they are joining are important to a new recruit's eventual satisfaction, retention, and performance. Moreover, because it can control several aspects of the recruitment process, this stage is often the easiest for an organization to change. This chapter will take both a descriptive and prescriptive approach to easing the socialization of new employees.

[6] Daniel C. Feldman, "The Multiple Socialization of Organization Members."

Anticipatory Socialization

Anticipatory socialization encompasses all of the learning that occurs prior to a recruit's entering on duty.[7] At this stage, an individual forms expectations about the job and makes decisions about the suitability of fit between himself and the organization. What a person has heard about working for a particular organization, such as an intelligence agency, provides an idea of what to expect if hired. Conversely, individuals who do not believe they would fit in may decide not to apply.

There are two variables that are particularly useful for tracking a potential employee's progress through the anticipatory stage: The first is *realism*, or the extent to which an individual acquires an accurate picture of daily life in the organization. Realism is influenced by the level of success recruits achieve during the information-sharing and information-evaluation part of their recruitment. The second is *congruence*, or the extent to which the organization's resources and the individual's needs and skills are mutually satisfying. Congruence is influenced by the level of success an individual has achieved in making decisions about employment. Although it cannot directly influence congruence, which is an inherently personal experience, an organization can present relevant information in order to provide a realistic and accurate description of the work performed and the work environment.

Organizations often use interviews to begin the socialization of new recruits. For example, an interviewer will attempt to provide an accurate description of what to expect from the job and the organization, the purpose being to reduce the likelihood that a recruit will be disturbed by unanticipated situations. Interviewing is also used to determine the degree to which there is a match between the values of potential recruits and the values of the organization. New recruits with personal values matching those of the organization have been found to adjust to the organization's culture more quickly than recruits with nonmatching values.[8]

Organizations also send cultural messages to new recruits during interviews. When there are several rounds of interviews with progressively senior members of the organization, for example, the message conveyed is that finding the best person for the position is important. In contrast, hiring for a part-time job at the lowest level of the organization is often accomplished quickly, to the extent that a person having minimally acceptable qualifications may

---

[7] This stage is termed "pre-arrival" in Lyman W. Porter, Edward E. Lawler, and J. Richard Hackman, *Behavior in Organizations*.

[8] Jerald Greenberg and Robert A. Baron, *Behavior in Organizations*: *Understanding the Human Side of Work.*

often be hired on the spot. The cultural message in this case is that such employees are easily let in to and out of the organization.

Another, particularly pertinent example is intelligence work, which requires that recruits undergo employment screenings unlike those found in most civilian jobs. Potential CIA analysts must submit to a thorough background investigation, a polygraph examination, and financial and credit reviews. Further, a battery of psychological and medical exams must be passed prior to a formal employment offer. The timeframe for the background check eliminates the possibility of a rapid hiring decision. Even more important are the nonverbal messages sent to the recruit that this is a position of secrecy and high importance.

Several sources of information contribute to beliefs about any organization. Friends or relatives who are already part of the organization might share their experiences with the person considering employment. Information might also be acquired from other sources, such as professional journals, magazines, newspaper articles, television, governmental and private Web sites, public statements or testimony, and annual reports. While these sources of information about an organization are far from perfect (all may contain positive and negative hyperbole), they are still useful from the point of view of forming preliminary ideas about what it might be like to work for that organization.

Because competition for highly qualified employees is fierce, successful recruitment usually involves a skillful combination of salesmanship and diplomacy. Recruiters tend to describe their organizations in glowing terms, glossing over internal problems and external threats, while emphasizing positive features. The result is that potential employees often receive unrealistically positive impressions of conditions prevailing in a specific organization. When they arrive on the job and find that their expectations are not met, they experience disappointment, dissatisfaction, and even resentment that they have been misled. In fact, research findings indicate that the less employees' job expectations are met, the less satisfied and committed they are and the more likely they are to think about quitting or actually to do so.[9]

These negative reactions are sometimes termed entry shock, referring to the confusion and disorientation experienced by many newcomers to an organization. In order to avoid entry shock, it is important for organizations to provide job candidates with accurate information about the organization. Research supports the notion that people exposed to realistic job previews later report higher satisfaction and show lower turnover than those who receive glowing, but often misleading, information about their companies.[10] Moreover, having

[9] John P. Wanous et al., "The Effects of Met Expectations on Newcomer Attitudes and Behavior: A Review and Meta-analysis."

[10] Bruce M. Meglino et al., "Effects of Ralistic Job Previews: A Comparison Using an Enhancement and a Reduction Preview."

realistic expectations helps to ease the accommodation stage of the socialization process.

Consequences of Culture Mismatch

> *When I got here, I felt like a rabbit stuck in headlights. Now, I feel like a deer.*
>
> *It took me a while to figure out that this place runs more like a newspaper than a university.*
>
> *It's pretty solitary work. I spend all day in my head. I really wasn't expecting that.*

There are several consequences of a cultural mismatch between an employee and an organization. Among these consequences are culture shock, low job satisfaction, low employee morale, increased absenteeism, increased turnover, and increased costs.

Culture Shock. People often have to be confronted with different cultures before they become conscious of their own culture. In fact, when people are faced with new cultures, it is not unusual for them to become confused and disoriented, a phenomenon commonly referred to as culture shock.

Beryl Hesketh and Stephen Bochner, among others, have observed that the process of adjusting to another culture generally follows a U-shaped curve.[11] At first, people are optimistic about learning a new culture. This excitement is followed by frustration and confusion as they struggle to learn the new culture. After six months or so with the organization, people adjust to their new cultures, become more accepting of them, and are more satisfied by them. For those who enter a mismatched culture, the productivity issue is clear: the several months required to adjust and accept the new work style results in several months of even lower productivity than is obtainable with those who fit in right away.

Job Satisfaction. Job satisfaction is defined by one scholar as "people's positive or negative feelings about their jobs."[12] It is hardly surprising that dissatisfied employees may try to find ways of reducing their exposure to their jobs. This is especially significant when one considers that people spend roughly one-third of their lives at work.

[12] Edwin A. Locke, "The Nature and Causes of Job Satisfaction."

Interestingly, research suggests that the relationship between satisfaction and task performance, although positive, is not especially strong.[13] Thus, while job satisfaction may be important to the longevity of any individual career cycle, it is not a major factor in individual job performance. It does, however, increase absenteeism, which has a negative effect on overall organizational productivity.

Absenteeism and Turnover. Research indicates that the lower an individual's job satisfaction, the more likely he or she is to be absent from work.[14] As with job satisfaction and task performance, this relationship is modest but also statistically significant. An employee may even choose to leave an organization altogether. This voluntary resignation is measured as employee turnover and has fiscal consequences for both the individual and the organization.

Fiscal Cost. Employee turnover is a critical cost element. The expense of recruiting and training new employees, along with lost productivity from vacant positions and overtime pay for replacement workers, increases operating costs and also reduces employee organizational output.

A 2002 study by the Employment Policy Foundation found that the estimated turnover cost is $12,506 per year per full-time vacancy for the average employee with total compensation (wages and benefits) of $50,025.[15] As the average annual turnover benchmark within the Fortune 500 is 23.8 percent, one can clearly see how critical it is for organizations to lessen the number of employees who leave voluntarily. Even unscheduled absences can be expensive—averaging between $247 and $534 per employee, per day, according to the same study.

Anticipatory Socialization in the Intelligence Community

> *The secrecy is strange. I thought it would be romantic, but it turns out that it is just strange.*
>
> *I was sold on the cool factor. It's still sort of cool, I guess.*

Accepting a job with one of the 14 members of the Intelligence Community differs from other professions in that it is difficult for new employees to have a clear and precise understanding of the roles and responsibilities they are about

---

[13] The correlation is 0.17 according to Michelle T. Iaffaldano and Paul M. Muchinsky in their "Job Satisfaction and Job Performance: A Meta-Analysis."

[14] Lyman W. Porter et al., "Organizational Commitment, Job Satisfaction and Turnover Among Psychiatric Technicians."

[15] This number does not take into account the additional costs within the Intelligence Community for background and security investigations.

to assume. This is all the more pronounced because, for the most part, the Intelligence Community organizations lack a civilian counterpart.

Occasionally, the anticipatory socialization of people entering the intelligence analysis discipline will derive from accounts of current or former practitioners. More generally, however, a newcomer's initial impressions stem from the fictional media portrayals, which tend to emphasize the supposed glamour of operational tasks and pay little attention to the reality of research-based analytic work. The absence of hard knowledge about intelligence work is attributable, in part, to the organizational secrecy of the Intelligence Community and, in part, to the actual socialization process that occurs after one has been accepted for employment and has passed the required background investigation.

A newcomer's experience is often contrary to initial expectations. Employees are discouraged from talking about the specifics of their work outside of the organization or with those who have not been "cleared." On an individual level, this experience translates into professional culture shock and social isolation. Organizationally, an intentionally closed system of this kind has a number of potential performance-related consequences, among them perpetuation of the existing organizational culture by hiring familial legacies or those most likely to "fit in," job dissatisfaction, low morale and consequent reduction in employee readiness, increased employee turnover, greater likelihood of "groupthink," and strong internal resistance to organizational change.[16]

Since the attacks of 11 September, the Intelligence Community has become more open about its role in government, its day-to-day working environment, and its employees' functions and responsibilities. While this openness is an extension of an ongoing trend toward public outreach—an example is the CIA's Officer-in-Residence program established in 1985—the community has accelerated this trend toward openness in an effort to help the public, and its representatives, understand the missions and value of the Intelligence Community.[17]

This trend toward openness has improved employee retention by counteracting the culture shock of misinformed anticipatory socialization and resultant employee turnover. This trend also helps prepare the organization for the inevitable changes to come by increasing the potential recruitment pool, expanding the intellectual diversity of its staff, and fostering better relations with its broader constituency, the American public.

[17] See CIA Officer in Residence Program in Web Resources in bibliography.

Conclusion and Recommendations

As noted, there is something of a disconnect between the largely fictionalized portrayal of the Intelligence Community in the popular media and the actual experience of intelligence analysts. This disconnect can be exacerbated once a recruit is on the job and can lead to negative consequences and behaviors, such as organizational culture shock, employee dissatisfaction, and increased employee absenteeism and turnover. This has an obvious effect on individual analysts, but it has a direct effect on the efficiency and effectiveness of the Intelligence Community.

Since the September 2001 attacks, some members of the Intelligence Community have acted to change the socialization process by providing accurate and realistic career information. One of the most widely used media for this is the Internet. For example, the Central Intelligence Agency's (CIA) Web site contains a section on "Life at the CIA."[18] This section contains information about the Agency and its culture, several analyst profiles and job descriptions written in the analyst's own words, and information concerning employee benefits and social and intellectual diversity. Although the "Employment" section of the Federal Bureau of Investigation's (FBI) Web site is less detailed than the "Life at the CIA" section of the CIA Web site, it does illustrate a typical first assignment.[19] In contrast, the "Careers" section of the Defense Intelligence Agency's (DIA) Web site contains detailed information on current job openings and the application process, but it provides no information about the actual work of a DIA analyst.[20] Steps such as these are encouraging, but they are still insufficient. There are more active things that can be done to facilitate the socialization of new employees.

To begin, Intelligence Community components should accept that what most people know about a job is often false and that it is incumbent on the organization and its recruiters to present accurate pictures and to work diligently to dispel myths. This will help to counteract the effects of culture shock. Instead of overselling a particular job or organization, recruiters should focus on facilitating the anticipatory socialization of potential employees by providing accurate information about the job and about the culture of the organization itself. Early in the selection process, applicants should be provided with realistic job previews, presented in either written or oral form. Previews should contain accurate information about the specific conditions within an organization and the specific requirements of the job. Research has shown that providing accurate descriptions of tasks is important in increasing job commitment and job satisfaction, as well as decreasing initial turnover of new

[18] See Central Intelligence Agency Web site in Web Resources.
[19] See Federal Bureau of Investigation Web site in Web Resources
[20] See Defense Intelligence Agency and US Intelligence Community Web sites in Web Resources.

employees.[21] The job preview allows candidates to make an informed decision to continue with the recruitment process or to withdraw from it if they feel the job is not appropriate. Realistic previews also lower unrealistically high expectations. A particularly good example of such an effort can be found on the CIA's Office of General Counsel Web site. This Web site includes a section titled "Misconceptions about working for the CIA," which tries to dispel prejudices and biases about employment at the CIA by addressing them in a straightforward manner.[22] In addition, the authors explain the benefits of having work experiences with the CIA for future employment endeavors in other areas.

Interview screenings of applicants should be reviewed and improved where needed. Hiring interviews are not very effective predictors of job performance; even so, there are ways to improve their reliability and validity. Numerous cognitive measurement instruments are available that help predict a match between an individual's knowledge, skills, and abilities and specific behavioral, cognitive, and psychomotor tasks.[23] In addition, the use of structured interviewing - posing the same questions to all applicants - is more effective than unstructured interviewing. Structured interviews allow for consistent comparisons among applicants.[24] Organizations should also consider using panel interviews. Differences among individual interviewers may result in inaccurate judgment of an applicant, but the overall decision of a team of evaluators may improve reliability.[25]

The use of situational exercises should be included in the recruitment process. These exercises usually consist of approximations of specific aspects of a job. They can be used to evaluate candidates' job abilities and to provide candidates with simulated work tasks. The former can facilitate organizational evaluations of candidates' performance on a job-related task; the latter may help candidates to decide whether the job would be a good match.[26]

A desirable additional step would be the creation and expansion of academic degree programs with a focus on intelligence and intelligence analysis. Further, an enhanced effort to improve public awareness and understanding of the Intelligence Community through greater community outreach, internships,

research fellowships, professional workshops, and academic forums will help to facilitate better employee relations by providing potential employees with a clearer perspective on what to expect after receiving their badge.

CHAPTER NINE

Recommendations

The First Step: Recognizing A Fundamental Problem

It is far too early in the research process to determine if any one organizational model for the Intelligence Community is more or less effective than any other, but I believe there is a fundamental structural question that needs to be addressed at the outset. This is, in my view, that current reporting competes for time and resources with indications and warning (I&W) intelligence. This emphasis is unlikely to change, for several reasons. First, current intelligence reporting results in significant "face-time" for the Intelligence Community with policy makers, who, in turn, provide the resources that fund and support community activities. This is a significant contributor to the social capital that the Intelligence Community commands.

The second reason is that in-depth research of the kind that contributes to I&W intelligence is a long-term investment whose payoff is often an abstraction. Not infrequently, successful warnings are taken for granted. Those that fail, however, may well involve the community in public recriminations that cost the Intelligence Community significant social capital. In this sense, the Intelligence Community's focus on current reporting is understandable. The problem is that producing current intelligence tends to become an all-consuming activity. The majority of analysts who participated in this study said that their time was spent on current reporting. Unfortunately, this does little to improve I&W intelligence, which requires long-term research, in-depth expertise, adoption of scientific methods, and continuous performance improvement. The return for the Intelligence Community, in terms of social capital, may be quite limited and even, as noted above, negative. Thus, the analytic area most in need of long-term investment often gets the least.

As the resources available to intelligence analysis are limited, it needs to be determined if those resources are better spent on the reporting functions of the Intelligence Community or on warning functions. It also needs to be determined whether these functions should be performed by the same analysts or if they are two separate career tracks. To make this determination, the Intelligence Community will need to invest in what I call a Performance Improvement Infrastructure as well as basic and applied analytic research.

Performance Improvement Infrastructure

The first step in improving job or task-specific performance is the establishment of a formal infrastructure designed explicitly to create an iterative performance improvement process. Such a process would include:

- measuring actual analytic performance to create baseline data;
- determining ideal analytic performance and standards;
- comparing actual performance with ideal performance;
- identifying performance gaps;
- creating interventions to improve analytic performance;
- measuring actual analytic performance to evaluate the effectiveness of interventions.

Several organizational, or infrastructure, assets should be developed to support this process. These should include:

- basic and applied research programs;
- knowledge repositories;
- communities of practice;
- development of performance improvement techniques.

The performance improvement process would be repeated throughout the life cycle of an organization in order to encourage continuous improvement. With the infrastructure and process in place, an organization would be capable of adapting to new or changing environmental conditions.

Infrastructure Requirements

Institutional changes, such as corporate reorganizations, are often enacted without a clear understanding of their potential or actual impact. What is most often missing in such changes is a basic research plan or a systems approach

to determine and predict the effect on organizational performance. The same is true with the Intelligence Community. Although there have been numerous proposals to reorganize the Intelligence Community—including those that resulted from the hearings of the Kean 9/11 commission—few have addressed the question of why one change would be any more effective than any other change. Merely asserting, based on some a priori notion of effectiveness, that organizational scheme X is more effective than organizational scheme Y is insufficient evidence. What is needed is a posteriori data, such as case studies, to support or refute the proposed change.[1]

Organizational Requirements. Many large organizations distribute performance improvement responsibilities throughout the organization at a supervisory or midlevel of management, but the group most often charged with collecting and analyzing performance data is the human resources department. This task generally involves developing task-specific performance standards and metrics based on expert performance models and in accordance with corporate policy.

The human resources department also becomes the central repository for pre-, periodic, and post-performance measurements. As this department generally has contact with employees throughout their careers, this is the most efficient way to manage, analyze, and inform senior leadership about aggregate changes in performance over time. Although data are collected at the individual level, it is the aggregation of performance data that allows leadership to determine the effectiveness of any organizational change or job-related intervention.

Baseline Data. Measuring actual analytic performance is essential to the establishment of a data driven performance infrastructure. The analysts in this study perceived their performance to be tied directly to the quantity of written products they produced during each review period. Counting the number of analytic publications is one metric, of course, but it is hardly indicative of analytic quality. Surgeons are a useful example of this problem.. They may count the number of patients they treat, but this metric says more about system throughput and salesmanship than it does about surgical performance. Unlike the purely cognitive work of intelligence analysts, surgeons have the advantage of multiple physical outputs, which makes measurement an easier task. In particular, surgeons have patient outcomes, or morbidity and mortality ratios, which become a grounded end-state for all measurements.[2] Other things being equal, these data then ought to inform a prospective patient about where to take his or her business.

---

[1] William Nolte, a deputy assistant director of central intelligence for analysis and production proposed such an idea in "Preserving Central Intelligence: Assessment and Evaluation in Support of the DCI " in *Studies in Intelligence* 48, no. 3 (2004): 21–25.

For intelligence analysts, the question may be put as, "What is an analytic morbidity and mortality ratio?" The process of describing and identifying morbidity and mortality, or error and failure in analytical terms, is a necessary step in identifying mechanisms to develop, test, and implement performance improvement interventions. There was little consensus among the participants in this study about what comprises failure, or even if failure was possible. There was greater consensus regarding the nature of analytic error, which was generally thought to be a consequence of analytic inaccuracy.

Metrics. One could reasonably conclude that compounded errors lead to analytic failure. Conversely, one could conclude that failure is the result of analytic surprise, that its causes are different from the causes of error, and that it needs to be treated as a separate measurement. This subject is open to debate and will require further research. It is still possible, however, to use both accuracy and surprise as metrics in evaluating analytic performance on a case-by-case basis.

The advantage of an error and failure metric is that it is observable in a grounded state separate from the analytic process. Any analytic product can be reviewed to determine levels of accuracy, and any unexpected event can be traced back through analytic products to determine if there was an instance of surprise.

Once levels of error and failure are calculated, along with measures of output, it is possible to determine expert levels of performance and to derive performance models based on successful processes. In any organization, there will be those individuals with the greatest output—in this case, the greatest number of written products. There will also be individuals with the highest levels of accuracy—in this case, factual consistency. There will also be individuals who have the lowest incident of surprise—in this case, those who generate the greatest number of potential scenarios and track and report probabilities most reliably. Using data-driven metrics means that expertise is not a function of tenure; rather, it is a function of performance.

Once expert performers are identified, it is possible to capture their work processes and to develop performance models based on peak efficiency and effectiveness within the Intelligence Community. Through the use of cognitive, behavioral, and linguistic task analyses, ethnography, and controlled experiments, it is possible to generate process metrics to identify analytic methods that are more effective for specific tasks than other methods. This is not to say that there is one analytic method that is the most effective for intel-

[2] Grounded Theory is the development of theoretical constructs that result from performing interpretive analysis on qualitative data rather than relying on a priori insights. The theory is then derived from some grounded data set. Barney Glaser and Anselm Strauss, *Discovery of Grounded Theory*; Barney Glaser, *Theoretical Sensitivity*; Barney Glaser, *Basics of Grounded Theory Analysis*.

ligence analysis; rather, each type of task will have an analytic method that is best suited to accomplishing it in an efficient and effective manner.

Developing these metrics is no small task. It is a job that will require numerous researchers and research programs within, or with access to, the Intelligence Community. These programs will need formal relationships with human resource departments, analytic divisions, organizational leadership, and developers of training and technology interventions in order to have a positive effect on analytic performance.

Research Programs

The results of this research indicate that the Intelligence Community needs to commit itself to performance research that is rigorous, valid (in that it measures what it proposes to measure), and replicable (in that the method is sufficiently transparent that anyone can repeat it). Within some intelligence organizations, this has been an ongoing process. The problem is that most of the internal research has concentrated on historical case studies and the development of technological innovations. What is missing is focused study of human performance within the analytic components of the Intelligence Community. Questions about the psychology and basic cognitive aptitude of intelligence analysts, the effectiveness of any analytic method, the effectiveness of training interventions, group processes versus individual processes, environmental conditions, and cultural-organizational effects need to be addressed.

This effort will require commitment. Researchers will have to be brought into the Intelligence Community, facilities will have to be dedicated to researching analytic performance, expert analysts will have to give some percentage of their time to participating in research studies, managers and supervisors will have to dedicate time and resources to tracking analytic performance within their departments, human resource staffs will have to dedicate time and resources to developing a performance repository, and there will have to be formal interaction between researchers and the community.

Analytic Performance Research. In the previous section, I discussed the need for analytic standards as part of the Performance Improvement Infrastructure. In terms of a research program, this will require, as a first step, the collection of baseline analytic performance data and a clear and measurable description of ideal analytic behavior. Next, there should be a determined effort by human performance researchers to develop, test, and validate analytic performance metrics and measurement systems. This will be a lengthy process. The accuracy and surprise measures suggested in this text require large historical and comparative data sets and are cumbersome and time consuming to perform. Conducting behavioral, cognitive, and linguistic task

analyses requires significant research expertise, ample time, and broad organizational access.

In time, analytic performance research will become a highly specialized domain and will require continuous organizational access not normally available to outsiders. It will become necessary for the Intelligence Community to establish internal or cooperative research centers in order to acquire the research expertise necessary to analyze and effect performance improvement. There are numerous community outreach efforts on which these centers can be built. Those efforts need to be expanded, however, and those programs need to include domains beyond the traditional relationship between the Intelligence Community and political or geographic area experts.[3]

Institutional Memory. The results of this research program indicate that there is a loss of corporate knowledge in the Intelligence Community due to employee attrition and the lack of a central knowledge repository for capturing "lessons learned." A number of industries and government organizations, including the Departments of Defense and Energy and the National Aeronautics and Space Administration, already maintain centers for lessons learned as an information hub for its employees.[4]

These centers act as information repositories for successful and unsuccessful operations and interventions. Their purpose is to reduce the amount of organizational redundancy and levels of error and failure by tracking, analyzing, and reporting on after-action reviews and analytic outcome data.[5] The other primary function of these repositories is to establish networks for communities of practice within and among organizations.

Networked communities of practice allow professionals to interact, exchange methodological information, post and respond to individual case studies, and develop ad hoc teams of experts for specific problem solving tasks. With simple search tools, basic database software, and a simple network visualization interface, any analyst in the Intelligence Community would be able to identify any other expert whose domain specialty was needed to answer a specific question or solve a specific problem. Another advantage of this model is the development of formal and informal mentoring within the network. Any novice would be able to find an expert within the Intelligence Community and establish a relationship that would be beneficial to both. With appropriate incentives, experts would be encouraged to contribute to the network and make available their time and expertise for the purpose of mentoring.

---

[3] An example of researching the validity and reliability of metrics can be found in the *Buros Mental Measurement Yearbook* at the Buros Institute of Mental Measurements Web site.

[4] See the US Army Center for Army Lessons Learned (CALL) Web site, which has links to numerous other repositories.

[5] See Chapter Six for a more detailed explanation of the After Action Review process.

Intelligence analysis, like other fields of science, is a cognitive process. Although tools and technologies may be available to assist cognitive processes, such as measurement devices for physical scientists, technology is ultimately merely a tool to be designed and developed using a human-centered approach. As such, any new technology needs to be a passive tool, employed by analysts to solve specific problems or answer specific questions, rather than a restrictive reinterpretation of cognition according to the rules of binary computation and artificial intelligence theorists.[6]

Analytic Psychology and Cognition. As evidenced by the work of Richards Heuer and others, there is significant research to be conducted into the cognitive mechanisms involved in intelligence analysis.[7] Understanding and defining the heuristics used in performing intelligence analysis, as well as cognitive-load thresholds, multitasking requirements, mechanisms that generate cognitive biases, and the utilization of pattern recognition strategies and anomaly detection methods are all areas that will prove fundamental to improving analytic performance.

In addition to researching basic cognitive functions and intelligence analysis, this area of research will be valuable for understanding how external variables, such as time constraints and analytic production methods, affect the cognitive processing of individual analysts. Another result will be the development of future employee screening and selection tools that will match the specific cognitive requirements of intelligence analysis with each applicant's individual knowledge, skills, and abilities.

Analysts employ cognitive strategies that are time efficient in order to cope with the demands of producing daily written products, but such strategies are not necessarily the most effective analytic methods for increasing analytic accuracy and decreasing the occurrence of analytic surprise. In fact, improving analytic accuracy and avoiding surprise may require mutually exclusive analytic strategies. This line of inquiry will require baseline performance data generated through the development of performance metrics and conducted in conjunction with research in analytic methodology effectiveness. The results would then be integrated into a knowledge repository.

These types of studies will require experimental psychologists and cognitive scientists working in controlled laboratory environments with consistent access to working professional analysts.

---

[6] See Chapter Five for a more detailed description of the limitations of technological solutions.

Heuer, Jr., *Psychology of Intelligence Analysis*; William Brei, *Getting Intelligence Right*; Isaac Ben-Israel, "Philosophy and Methodology of Intelligence: The Logic of Estimate Process"; Klaus Knorr, *Foreign Intelligence and the Social Sciences*; Abraham Ben-Zvi, "The Study of Surprise Attacks." See also Marjorie Cline, Carla Christiansen and Judith Fontaine, *Scholar's Guide to Intelligence Literature*.

Development and Validation of Analytic Methods. The Intelligence Community routinely generates ad hoc methodologies to solve specific analytic problems or crises. However, once the problem has been solved, or the crisis averted, the new analytic method may or may not become part of the institutional memory. Often these new methods are lost and need to be re-created to address the next problem or crisis. In addition, these methods are seldom tested against other competing analytic methods for validity or reliability. It is difficult for an analyst to know which analytic method to employ in a given situation or requirement.

There are obvious inefficiencies in the current model. First, there is the loss of corporate knowledge each time an innovative analytic method is generated and subsequently abandoned. Second, there is no effectiveness testing center where analytic methods can be compared for specific cases. Although there are hundreds of analytic strategies, there is no way to determine which strategy is the most effective for any particular problem set.

The lack of an analytic methodology research agenda leads analysts to choose methods with which they are most familiar or to choose those dictated by circumstance, such as deadlines. Moreover, instead of advancing the concept that intelligence analysis is science and needs to be engaged in like any other scientific discipline, the paucity of effectiveness data supports a deep-seated community bias that analytic methods are idiosyncratic and, therefore, akin to craft.

The development of a research agenda for analytic methodology that is focused on collecting effectiveness and validation data is the first step in moving intelligence analysis from a tradecraft model to a scientific model. This may be the most culturally difficult recommendation to implement: there is cultural resistance to adopting a science-based model of intelligence analysis that is rooted in the traditions, norms, and values of the Intelligence Community. Another difficult step will be to introduce effectiveness data and corresponding analytic methods to the community at large and to incorporate these in future training programs.

Training Effectiveness. Successful analysis demands group cohesion and the implementation of consistent, effective analytic methods within the Intelligence Community. The best way to achieve this is through formal basic and advanced training programs. As noted earlier, several agencies within the community have invested resources in formal training programs, but these programs are unique to each agency and are often missing evaluations of student performance. Although most formal courses include a written subjective evaluation of the instructor, as well as the student's perception of the value of the course, the evaluation of student performance has yet to be formalized.

Without evaluating preintervention, or precourse, performance and following that with a postintervention evaluation, it is difficult to determine the effect that any training intervention will have on employee performance. In addition to formal measurements based on course objectives, it is important to collect performance data from managers and supervisors to evaluate the retention of training and the impact that training has had on actual day-to-day performance.

Developing performance metrics will inform and advance the training interventions currently employed in the Intelligence Community and will determine the gap between ideal performance and actual performance. As such, the system is an iterative process of setting performance standards, measuring actual performance, designing training interventions to improve performance, and evaluating the effects of those interventions on actual performance. The data derived from these interventions and measurements will then contribute to the growth of the knowledge repository and strengthen the ties created through the communities of practice.

Organizational Culture and Effectiveness. Identifying existing organizational norms and taboos is the first step to creating an internal dialogue about the future of an organization and its place in a competitive environment. Culture drives the operations of an organization, determines the people who are hired, enculturates new employees, establishes standards of behavior and systems of rewards, shapes an organization's products, and determines the social capital that any organization may possess. In short, culture defines an organization's identity to itself and to others.

Understanding the culture of the Intelligence Community and analyzing the effects of any performance intervention on that culture contributes to the evaluation of intervention effectiveness. Effective performance interventions will have a positive effect on the organization's culture and become themselves measurement instruments.

Developing cultural markers to track organizational change and performance improvement requires baseline ethnographic data and the identification of key cultural indicators. Once identified, cultural indicators such as language use, norms, and taboos would be measured at regular intervals and would serve as grounded data to determine levels of change within the organization. This would permit interventions to be modified before they became ritualized within the Intelligence Community.

The Importance of Access

The improvement of human performance often requires an organization to change its culture, and organizational leaders seldom possess sufficient power to mandate cultural change by edict. At best, management can introduce

agents or agencies of change and manage their organization's culture in the same way they manage physical and financial resources. An organization's culture shapes individual behavior by establishing norms and taboos and, ultimately, determines the quality and character of an organization's products. Culture and product are inseparable, and one cannot be changed without affecting the other. The choice confronting any organization is to manage its institutional culture or to be managed by it.

There is no single path to carrying out the research recommended in this work. It could be performed at a single center or coordinated through several specific centers; it could be purely internal to the Intelligence Community; a cooperative effort among the community, academe, and national laboratories; or some combination of these. What is most important to effective implementation is that there be regular and open access among researchers and the Intelligence Community. This may appear simple enough, but access equals trust, and trust is difficult to establish in any domain. This is especially the case within the Intelligence Community. The Intelligence Community needs to increase its commitment to community outreach efforts. This study is one such effort.

During the course of my research, the value of access and the premium the community places on trust quickly became evident. At agency after agency, physical access restrictions, security clearances, forms, interviews, phone calls, questions, vetting, and more vetting were all signs of the value, not of secrecy per se, but of trust and access. Without this sort of cooperation, this research would have been impossible, and this is an important lesson that ought to inform future research programs.

PART IV

Notes on Methodology

CHAPTER TEN

Survey Methodology

This study included 489 interviews with intelligence professionals, academics, and researchers throughout the Intelligence Community. It also involved participation in intelligence training programs, workshops, and focus groups; direct observation of intelligence analysts performing their duties, and participant observation in a variety of analytic tasks. My access was not restricted to specific people, locations, or organizations. I was allowed to observe, interview, and participate in whatever manner I thought would be most beneficial to the research project.

Unlike other academic studies of the intelligence discipline (case studies or topic-specific postmortems, for example), this study was process oriented. It also differed from the work of Sherman Kent, Richards Heuer, and other intelligence professionals concerned with the process of intelligence analysis.[1] Rather than having an intelligence professional looking *out* to the social and behavioral sciences, this study had a social scientist looking *in* at the intelligence profession. Although some of the conclusions of this work may be similar to previous studies, the change in perspective has also led to some different findings.

It is important to keep in mind that cultural anthropology is a qualitative discipline and that, in general, its findings are descriptive and explanatory rather than inferential or predictive. The use of ethnographic methods to describe a culture, the environment in which that culture operates, and the work processes that culture has adopted is designed to generate testable theory that can be investigated experimentally or quasi-experimentally using other

[1] Sherman Kent, *Strategic Intelligence for American World Policy;* Richards J. Heuer, Jr., *Psychology of Intelligence Analysis.*

research methodologies. Additionally, ethnography is used to identify and describe the influence of different variables on cultural phenomena, again with a focus on developing testable theory. Unlike more quantitative disciplines, cultural anthropology is not traditionally employed experimentally to test theory or to generate predictive measures of statistical significance.

The findings in this work describe the data collected during this study, but they do not indicate the weight or general statistical effect of any one variable as opposed to any other variable. Although a single variable might have more effect on the error or failure rate of intelligence analysis, further quantitative research will be needed to determine those statistical values. Without additional quantitative support, it may not be possible to generalize from these findings.

Methodology

This study used an applied anthropological methodology for the collection and analysis of qualitative data.[2] A traditional approach to ethnography, the descriptive documentation of living cultures, was modified for use in post-industrial organizational settings.[3] This method included conducting interviews, directly observing analysts performing their jobs, participating in analytic tasks and training, and conducting focus groups. The settings for this research included the 14 members of the Intelligence Community, related government agencies, universities, think tanks, national laboratories, the National Archives and related presidential libraries, and private and corporate locations.

The background data were collected using a Q-sort literature review method, which is discussed in more detail in Chapters Three and Eleven. This procedure was followed by semi-structured interviews, direct observation, participant observation, and focus groups. The Q-sort method was employed specifically because of its utility for developing taxonomic categories.[4]

The identity of the research participants will not be revealed. Participant responses and observational data gathered during the research process have been tabulated and made anonymous or aggregated according to context and

content and, thus, are not attributable to any specific individual. This is not simply the result of security procedures within the Intelligence Community; it is also the professional obligation of every member of the American Anthropological Association, as stated in the American Anthropological Association Code of Ethics.[5]

The interview technique employed in this study was semi-structured. Several specific questions about the participant's perception of the nature of intelligence, the analytic process, the intelligence production cycle, and intelligence errors and failures were standard throughout the interviews. Other questions, specific to the individual's job responsibilities, were tailored to each respondent. This method allowed for a more open-ended approach, which surveys and highly structured interviews do not. The semi-structured method is more akin to an open conversation (with consistent data collection constructs and probing questions) than to a formal interview, which helps put the respondents at ease and makes the entire process seem somewhat less contrived.

Access to interview participants was made possible through the Center for the Study of Intelligence. Individuals at CSI introduced me to their contacts throughout the Intelligence Community, including active and retired senior analysts, managers and senior leadership, as well as to academics and researchers. The various intelligence-training centers put me in touch with new hires and novice analysts. Each interviewee was asked to make recommendations and provide contact information for others who might be interested in participating in this research project. In addition, numerous interviewees were approached without a formal or informal introduction from a previous participant. Only four of the 489 individuals contacted to date have declined to participate in this study. This constitutes a participation rate of greater than 99 percent, which is unusually high for this type of research. Although a participation rate this high may be an artifact of the sampling method or of an organizational pressure to participate, it also may indicate a general desire within the Intelligence Community to support performance improvement research.

Unlike random sampling, purposive sampling is an attempt to collect data from specific data sources. In anthropological studies, purposive sampling is regularly used to address specific issues and to answer specific questions. Normally, this approach requires finding a "key informant" or someone on the inside of a specific culture who will become the researcher's ally and access agent. In this particular study, the CSI staff acted as access agents to the Intelligence Community at large.

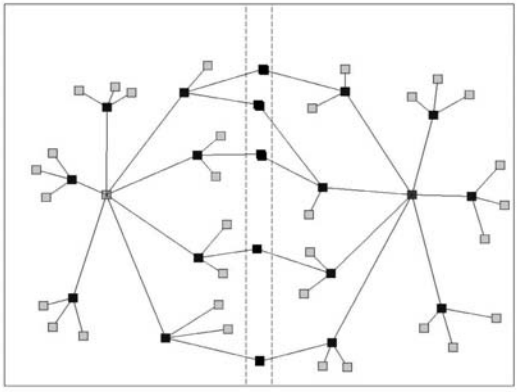
---

[5] American Anthropological Association, *Code of Ethics of the American Anthropological Association*.

Relying on such a "social network" sampling method for collecting interview data does pose potential statistical biases.[6] The likelihood that each new interviewee was referred to me because of a friendly relationship with a previous interviewee may mean that those references are "like minded" and not necessarily representative of the population of intelligence professionals. In order to counteract that bias, efforts were also made to enlist individuals without any social network-based introduction. The "cold" contacts were informed of the nature of the research project, its sponsorship, and its goals, given reference information for verification, and then invited to participate. The "cold" contact interviewees were also asked to make recommendations and provide contact information for others who might be interested in participating in the study.

This strategy was used in an attempt to reduce the affects of sampling bias by generating parallel social network samples. The figure below is a visual representation of a parallel social-network sampling model. The central, or first-order, node on the left is a "cold" contact or unknown individual who recommends several second-order contacts, each represented as a node within the left box. The second-order "cold" contacts then make additional recommendations for third-order contacts, and so on. The central (first-order) node on the right is a "hot" contact or a known individual who recommends several second-order contacts, each represented as a node within the right box. The second-order "hot" contacts then make recommendations for third-order contacts, and so on.

Social Network Mapping



In many instances, the contacts from both social network samples overlapped or converged on specific individuals, as represented by the overlapped fourth-order nodes in the central column. There are several possible explanations for this convergence. It may indicate that there are a number of respected "thought leaders" in the Intelligence Community whom each contact believed I should interview for this project, or the convergence of nodes

[6] Social network sampling is also known as "snowball" sampling in sociology and psychology.

might merely serve to emphasize the small size of Intelligence Community. In any case, this approach to sampling may help to ameliorate the sampling bias inherent in qualitative research.

In addition to semi-structured interviews, both direct and participant observation data collection methods were employed. The direct observation method involved watching Intelligence Community analysts perform their tasks in both actual and training environments, recording the physical and verbal interactions they had with one another, and observing the steps used to create intelligence products. Direct observation occurred over the course of two years by observing 325 individual analysts and teams of analysts performing their specific tasks. The data collected from observing the 325 analysts were not included in the semi-structured interview data because I did not use the formal semi-structured interview process to structure those interactions. These observational data were recorded separately in field notes and used for triangulating the findings from the interviews.

The participant observation method is employed to give the researcher a "first-person" understanding of the context and nuances associated with a task and the culture in which that task occurs. Although the researcher possesses only an approximation of the knowledge and understanding of the actual practitioners of the task and their culture, this "first-person" perspective can lead the researcher to new insights and new hypotheses.

During this study, the participant observation was conducted during analytic production cycles, scenario development, and red cell exercises. This included monitoring my own analytic strategies, the analytic strategies of others as diagramed or verbalized, the physical and verbal social interactions among the participants, the environment in which the tasks occurred, and the steps used to create a final intelligence product. These data, along with notes on social dynamics, taboos, and social power, were recorded in field notes and created a separate data source for triangulation.

With modern anthropology, these data normally would be captured on film, audiotape, or in some digital format. Due to the security requirements of the Intelligence Community, however, the data were captured only in the written form of field notes. As is the case with the field notes, the identity of the interview participants will not be disclosed. This is in keeping with both the security practices of the Intelligence Community and the professional standards described in the American Anthropological Association Statement on the Confidentiality of Field Notes.[7]

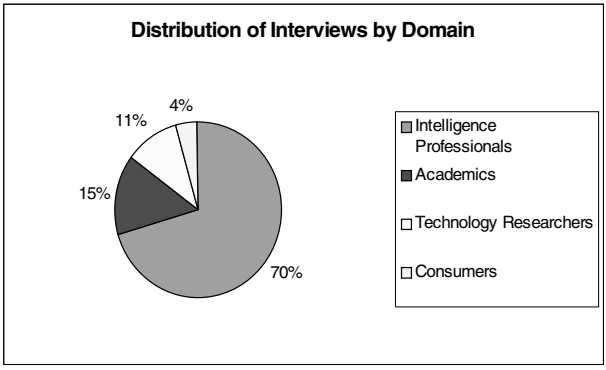
The data from the interviews were analyzed using a method called interpretational analysis.[8] This approach included segmenting the interview data into

[7] American Anthropological Association, *Statement on the Confidentiality of Field Notes.*

analytic units (or units of meaning), developing categories, coding the analytic units into content areas, and grouping the analytic units into categories. From these categories, general trends and specific instances can be identified. As noted, the direct and participant observational data were analyzed separately in order to triangulate the findings from the interview data. The purpose of using multiple data sources for triangulation is to uncover internal inconsistencies in the data, to cross-check those inconsistencies with the available literature, and to verify the content validity for each category.

Demographics

As of this writing, 489 semi-structured interviews have been conducted with active and retired intelligence professionals, intelligence technology researchers, academics who teach the intelligence discipline or have published in it, and consumers of intelligence products.[9] Of the 489 individuals interviewed, 70-percent were newly hired, active, or retired intelligence professionals; 15-percent were academics; 11-percent were intelligence technology researchers; and the remaining four percent were policy makers or senior consumers of intelligence products. The graph here shows the distribution of interviews by percentage for each professional category.



The table below lists each professional category and the corresponding total number (N) of individuals interviewed. The intelligence professional category is further divided into three sub-groups. The "novice" sub-group includes new hires and those with less than two years of experience.[10] The "active" sub-

[9] Additional interviews are being conducted.

group includes all those currently working in the Intelligence Community with more than two years of experience. The "retired" sub-group includes those who have spent more than fifteen years in the intelligence profession and have since gone on to either full retirement or other organizations outside of the Intelligence Community.

Of the 345 intelligence professionals interviewed, 20 percent were novices, 65 percent were active, and 15 percent were retired. The active and retired sub-groups include senior managers.

Interview Categories and Numbers

Category	**N**
Intelligence Professionals	345
Novice	(60)
Active	(233)
Retired	(52)
Academics	73
Technology Researchers	53
Consumers	18
Total Interviewed	**489**

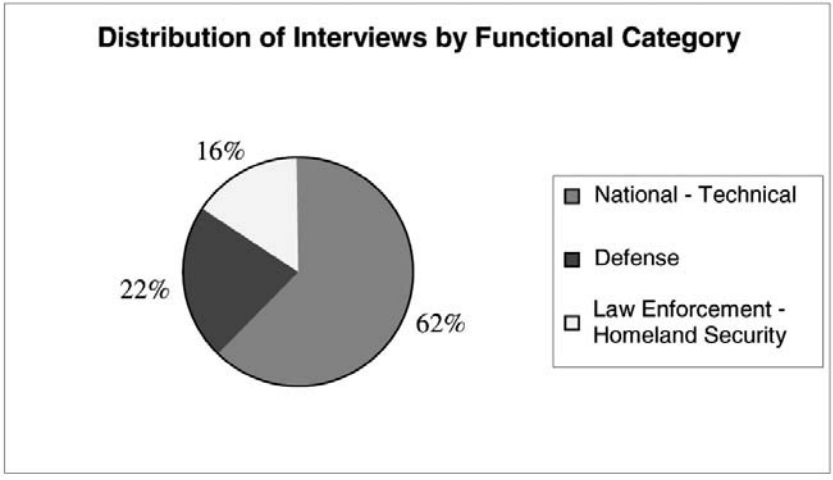
In order to assure anonymity for the participants, I have created broader job-related functional categories and associated the number of individuals interviewed with the broader categories rather than linking them to specific organizations within the Intelligence Community. This is in contrast to aggregating the agencies according to each agency's specific mission, process, or product. Although not an official member of the Intelligence Community, the Drug Enforcement Administration is included because of its intelligence function and resources. The table on the next page shows how I aggregated the agencies into National-Technical, Defense, and Law Enforcement-Homeland Security categories according to the professional functions of interview participants.

[10] The use of two years as a divide between novice and active is derived from the total amount of experience it is possible to gain in that time. See the discussion of expertise in Chapter Five.

Agency Aggregation According to Interviewee Job-type

National-Technical	Defense	Law Enforcement-Homeland Security
Central Intelligence Agency	Defense Intelligence Agency	Department of Homeland Security
National Security Agency	Army Intelligence	Federal Bureau of Investigation
National Reconnaissance Office	Air Force Intelligence	Department of Energy
National Geospatial Intelligence Agency	Navy Intelligence	Department of Treasury
Department of State (INR)	Marine Corps Intelligence	*Drug Enforcement Administration*

The figure below shows the distribution of intelligence professionals interviewed for this study according to each broader functional category. Of the 345 intelligence professionals interviewed, 214 work within the National-Technical Intelligence category, 76 in the Defense Intelligence category, and 55 in the Law Enforcement—Homeland Security category.



CHAPTER ELEVEN

Q-Sort Methodology

Observations always involve theory.

Edwin Hubble[1]

As described earlier, this work reflects triangulation of the data derived from the literature Q-sort, interview responses, and observations.[2] The data include 489 interviews, direct and participant observation of 325 analysts performing their jobs, participation in a variety of analytic tasks, and focus groups conducted to generate the taxonomy of variables that guided this study.

The first Q-sort of the data was aggregated according to the function of each intelligence organization, as listed in Table 1. The data were then analyzed to determine response context according to job type and to develop variable categories.

The organizational Q-sort generated the broad variable groupings used to create the second Q-sort parameters. The variable categories that emerged during the interpretive analysis of the first Q-sort of the data were compiled again, and a second Q-sort was performed based on those categories. The data was then aggregated according to categorical or variable groupings of the second Q-sort, Table 2.

The use of two separate Q-sort strategies generated the variables and then de-contextualized the data in order to find consistent trends throughout the Intelligence Community. That is, this strategy resulted in broad categories of findings that apply across many agencies. In those cases where interview and

---

[1] Edwin Hubble discovered the first evidence to support the Big Bang theory that the universe is expanding and that the Milky Way is not the only galaxy in the universe. He also developed the Hubble Galaxy Classification System and Hubble's Law (the farther away a galaxy is from Earth, the faster its motion away from Earth). Edwin Hubble, *The Realm of the Nebulae*.

[2] William Stephenson, *The Study of Behavior: Q-Technique and its Methodology.*

observational data could have been sorted into several categories, I based the placement of the data on the question that generated the interview response.

Table 1. Q-Sort 1. Data Grouping According to Organizational Function.

National – Technical	Defense	Law Enforcement – Homeland Security
Central Intelligence Agency	Defense Intelligence Agency	Department of Homeland Security
National Security Agency	Army Intelligence	Federal Bureau of Investigation
National Reconnaissance Office	Air Force Intelligence	Department of Energy
National Geospatial Intelligence Agency	Navy Intelligence	Department of the Treasury
Department of State (INR)	Marine Corps Intelligence	*Drug Enforcement Administration*

In several instances throughout the text, the quotes that were used may well fit in a number of other categories. Once the data were sorted by variable, the coding and context identifier notes were removed from all data in order to assure participant anonymity, in keeping with the American Anthropological Association *Code of Ethics*, section III, A.[3]

Table 2. Q-Sort 2. Data Grouping According to Variable Categories.

Time Constraints	Analytic Methods	Organizational Norms	Analytic Identity	Analytic Training
Products	Tradecraft	Taboos	Reportorial	Formal
Interactions	Science	Biases	Academic	Informal

The quotes that appear throughout the text are exemplars from each variable category and indicate trends found in the data-set. Although the exemplar quotes are not universal, nor are they necessarily subject to generalization, they do represent consistent findings from the interview and observation data. Utilizing this approach to develop theory is similar to the method in which grounded theory is employed in sociology, specifically, using grounded data to generate theory rather than using some a priori technique. The significant advantage to this approach is that the theory is directly tied to data, providing it additional validity. Another advantage is that the individuals who allowed me to interview and observe them are given some voice in the final product by way of direct quotes, which also provides some qualitative context.

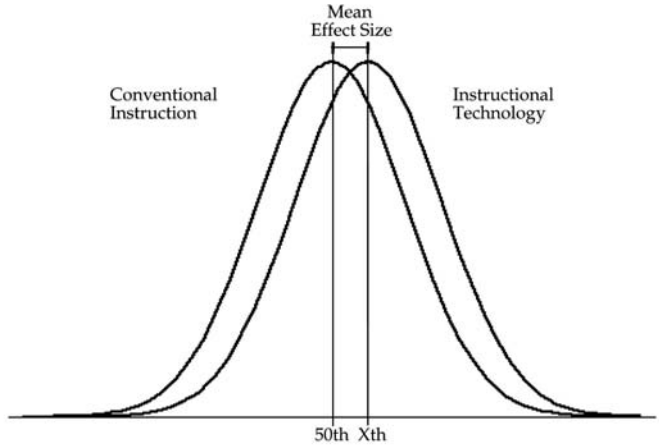
[3] American Anthropological Association, *Code of Ethics of the American Anthropological Association*.

CHAPTER TWELVE

The "File-Drawer" Problem and Calculation of Effect Size

The file-drawer problem appears to have two causes: the reluctance of researchers to report their null results and the reluctance of professional journal editors to include studies whose results fail to reach statistical significance. Such studies remain in the "file-drawers" of the researchers. How much would these inaccessible studies affect the results of our meta-analysis? The answer seems to be not much.[1]

Effect Size - Difference Between Two Means



[1] Gene Glass, and Barry McGaw, "Choice of the Metric for Effect Size in Meta-Analysis"; Larry Hedges, "Estimation of Effect Size from a Series of Independent Experiments"; Larry Hedges and Ingram Olkin, "Vote-Counting Methods in Research Synthesis."

Effect size is usually defined as the difference between the means of two groups divided by the standard deviation of the control group $\left(\Delta = \frac{\overline{X}_e - \overline{X}_c}{\sigma_c}\right)$.[2]

Effect sizes calculated in this way estimate the difference between two group means measured in control group standard deviations as seen in the figure above. Glass et al. suggest that the choice of the denominator is critical and that choices other than the control group standard deviation are defensible.[3] However, they endorse the standard choice of using the control group standard deviation.

Alternatively, Hedges and Olkin show that, for every effect size, both the bias and variance of its estimate are smaller when standard deviation is obtained by pooling the sample variance of two groups instead of using the control group standard deviation by itself.[4] An effect size based on a pooled standard deviation estimates the difference between two group means measured in standard deviations estimated for the full population from which both experimental and control groups are drawn: $\left(g = \frac{\overline{X}_e - \overline{X}_c}{S}\right)$,[5] where

S is the pooled standard deviation: $S = \sqrt{\frac{(N_e - 1)(S_e)^2 + (N_c - 1)(S_c)^2}{N_e + N_c - 2}}$.[6]

Most commentators suggest that effect sizes can be treated as descriptive statistics and entered into standard tests for statistical significance. Hedges and Olkin have shown that the error variance around estimates of effect size is inversely proportional to the sample size of the studies from which the effect sizes are drawn. If the effect size in any review is drawn from studies employing widely different sample sizes, then the heterogeneity of variance among effect sizes prohibits their use in conventional t-tests, analyses of variance, and other inferential tests. This is the case in most of these reviews; therefore, effect sizes reported in this study are treated only with descriptive statistics.

The effect sizes for computer-based training range from 0.20 to 0.46 depending on the population.[7] The effect size for distance instruction (television) is

---

[2] Δ = Glass's Effect Size, $\overline{X}_e$ = Experimental Mean, $\overline{X}_c$ = Control Mean, σ_c = Control Standard Deviation

[3] Gene Glass, Barry McGaw and Mary Lee Smith, *Meta-Analysis in Social Research*.

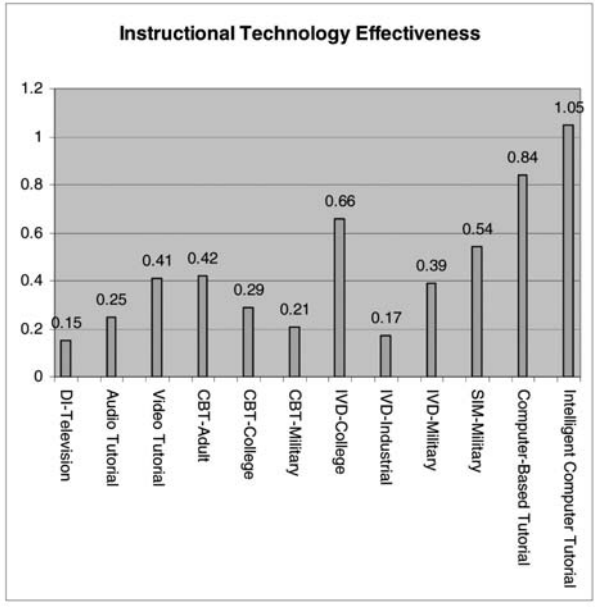
[4] Larry Hedges and Ingram Olkin, *Statistical Methods for Meta-Analysis*.

[5] g=Hedge's Effect Size, S=Hedge's Pooled Standard Deviation

[6] Ne=Number of experimental subjects, Nc=Number of control subjects, Se=Standard deviation of experimental group, Sc=Standard deviation of control group

0.15 and for interactive videodiscs, the effect sizes range from 0.17 to 0.66 depending on the population.[8] The effect size for flight simulation is 0.54 and the effect size for tutorials range from 0.25 to 0.41 depending on the presentation of the tutorial material.[9]

Although the effect sizes for instructional technology range from 0.15 to 0.66 standard deviations, they all report favorable findings when compared to conventional instruction. There are many possible explanations for the differences in instructional technology effectiveness; it might be the result of population differences, system differences, interactivity or individualization. From a purely utilitarian point of view, the reason may not be all that important. If, at the very least, using instructional technology forces the producer to rethink the content of the course to match the delivery system, then revisiting the pedagogy may be enough to produce the positive effect sizes. Whatever reason for the changes in effectiveness, the use of instructional technology saves instructional time, overhead costs, and results in a higher level of achievement for the students in a variety of domains.



[7] The abbreviations in figure one: CBT=Computer Based Training, DI=Distance Instruction, IVD=Interactive Video Disc, SIM=Simulation. More than 300 research studies were used to develop these effect sizes, see Chen-Lin Kulik., James Kulik and Barbara Shwalb, "Effectiveness of Computer-Based Adult Education: A Meta-Analysis"; Chen-Lin Kulik and James Kulik, "Effectiveness of Computer-Based Education in Colleges"; Rob Johnston and J. AFTERWORD

Joseph Hayes[1]

The unexamined life is not worth living

Socrates.

A very popular error: having the courage of one's convictions; rather, it is a matter of having the courage for an attack on one's convictions!

Nietzsche

Rob Johnston has written a superb book, a study of intelligence as it is actually practiced. Rob's book is alive with specific, practical recommendations about how the practice of intelligence could be made better. The literature of intelligence is overwhelmingly devoted either to studies which, however rigorous in their academic structure, fail to convey the humanness of the enterprise or to books and articles, too often self congratulatory or self promoting, which are little more than assemblages of entertaining anecdotes. Rob's study deserves a place of honor on the very small bookshelf reserved for analytically sound, deeply insightful works on the conduct of intelligence. Any serious discussion of reform or significant change in the ways in which US intelligence is organized, structured, and carried out will need to take this book as a starting point.

Rob's work bears witness to the imagination and commitment to excellence on the part of the senior intelligence officials who made it possible for a cultural anthropologist to carry out his field work in the secret, sometimes hermetically

[1] Joseph Hayes is a retired senior officer of the Central Intelligence Agency Directorate of Operations. He served more than 30 years in the clandestine service.

sealed, world of intelligence. Rob's work also bears witness to the tremendous passion among intelligence professionals to understand better what they do, why they do it, and how their work could be improved. There is, in this community, a palpable desire to do better.

Since the tragedy of 9/11 and the bitter controversies surrounding Iraqi WMD, the world of intelligence analysis has been scrutinized with an intensity of almost unprecedented dimensions. The focus of scrutiny, however, has been on the results, not on the process by which the results were produced and certainly not on the largely anonymous corps of civil servants whose work was at the heart of the issue. Those people, and how and why they do what they do, are at the heart of Rob's important study. If we are ever to make the improvements that must be made in the quality of our intelligence work, then we must begin with a more mature and nuanced understanding of who actually does the work, how, and why. There is a context within which the work is done, a definite culture with values, traditions, and procedures that help shape important outcomes.

Rob has characterized a world that I find all too familiar. It is a world in which rewards and incentives are weighted heavily in favor of filling in gaps in conventional knowledge rather than in leading the way to alternative points of view. It is a world in which confirming evidence is welcome and rewarded and disconfirmatory evidence is, at best, unwelcome and, at worst, discounted. It is a world in which the legitimate and often necessary resort to secrecy has served, all too often, to limit debate and discussion. It is a world in which the most fundamentally important questions—what if and why not—are too often seen as distractions and not as invitations to rethink basic premises and assumptions.

Much of the recent discussion concerning the performance of intelligence organizations has been conducted in almost mechanical terms. "Connecting the dots," "mining the nuggets" are phrases offered as a way of understanding the exquisitely subtle, complex business of making intelligence judgments. As Rob Johnston's book makes abundantly clear, this is first and foremost a human enterprise. All of the intellectual power, biases, and paradigms that inform the thinking of the people who actually do the work need to be understood in the organizational context in which they do their work. In the finest tradition of anthropological field research, Rob has observed, collected data rigorously, reflected with deep insight upon it, and produced a study both sophisticated and extremely useful.

I worked myself for more than 30 years in the clandestine operations area of CIA, a part of the Intelligence Community that calls out for the same kind of understanding, professional, and constructive scrutiny this book has devoted to the analytic realm. My fervent hope is that the human intelligence service will benefit from the same kind of rigor and constructive understanding the analytic side has now experienced. My real hope is that Rob is available for the job.

The Author

Dr. Rob Johnston is an ethnographer who specializes in the cultural anthropology of work. He has been a research staff member at the Institute for Defense Analyses and a Director of Central Intelligence Postdoctoral Research Fellow at the Central Intelligence Agency's Center for the Study of Intelligence, where he is now a member of the staff.

Dr. Johnston is a Fellow of the Royal Anthropological Institute, the Society for Applied Anthropology, and the Inter-University Seminar on Armed Forces and Society.

This publication is prepared primarily for the use of US government officials. The format, coverage, and content are designed to meet their requirements. To that end, complete issues of *Studies in Intelligence* may remain classified and are not circulated to the public. These printed unclassified extracts from a classified issue are provided as a courtesy to subscribers.

All statements of fact, opinion, or analysis expressed in *Studies in Intelligence* are those of the authors. They do not necessarily reflect official positions or views of the Central Intelligence Agency or any other US government entity, past or present. Nothing in the contents should be construed as asserting or implying US government endorsement of an article's factual statements and interpretations.

Studies in Intelligence often contains material created by individuals other than US government employees and, accordingly, such works are appropriately attributed and protected by United States copyright law. Such items should not be reproduced or disseminated without the express permission of the copyright holder. Any potential liability associated with the unauthorized use of copyrighted material from *Studies in Intelligence* rests with the third party infringer.

Studies in Intelligence is available on the Internet at: https:// www.cia.gov/library/center-for-the-study-of-intelligence/ index.html.

The Mission

The mission of *Studies in Intelligence* is to stimulate within the Intelligence Community the constructive discussion of important issues of the day, to expand knowledge of lessons learned from past experiences, to increase understanding of the history of the profession, and to provide readers with considered reviews of public literature concerning intelligence.

The journal is administered by the Center for the Study of Intelligence, which includes the CIA's History Staff, CIA's Lessons Learned Program, the CIA Museum, and the Agency's Historical Intelligence Collection of Literature. The center also houses the Emerging Trends Program, which seeks to identify the impact of future trends on the work of US intelligence.

Contributions

Studies in Intelligence welcomes articles, book reviews, and other communications. Hardcopy material or data discs (preferably in .doc or .rtf formats) may be mailed to:

Editor

Awards

The Sherman Kent Award of $3,500 is offered annually for the most significant contribution to the literature of intelligence submitted for publication in *Studies*. The prize may be divided if two or more articles are judged to be of equal merit, or it may be withheld if no article is deemed sufficiently outstanding. An additional amount is available for other prizes.

Another monetary award is given in the name of Walter L. Pforzheimer to the graduate or undergraduate student who has written the best article on an intelligence-related subject.

Unless otherwise announced from year to year, articles on any subject within the range of *Studies*' purview, as defined in its masthead, will be considered for the awards. They will be judged primarily on substantive originality and soundness, secondarily on literary qualities. Members of the *Studies* Editorial Board are excluded from the competition.

The Editorial Board welcomes readers' nominations for awards.

CENTER *for the* STUDY *of* INTELLIGENCE
Washington, DC 20505

EDITORIAL POLICY

Articles for *Studies in Intelligence* may be written on any historical, operational, doctrinal, or theoretical aspect of intelligence.

The final responsibility for accepting or rejecting an article rests with the Editorial Board.

The criterion for publication is whether, in the opinion of the Board, the article makes a contribution to the literature of intelligence.

EDITORIAL BOARD

Peter S. Usowski, Chairman
Pamela S. Barry
Nicholas Dujmovic
John McLaughlin
Philip Mudd
Wayne M. Murphy
Matthew J. Ouimet
Valerie P.
Michael Richter
Michael L. Rosenthal
Barry G. Royden
Ursula M. Wilder

Not listed are three members who are under cover. Members of the board are drawn from the Central Intelligence Agency and other Intelligence Community components.

Contributors

Matthew Berrett is the Assistant Deputy Director for the DNI President's Daily Brief. He has served as an analyst and manager of analysts covering Middle East issues in the CIA's Directorate of Intelligence.

Jeannie Johnson is a lecturer in the Political Science Department at Utah State University. Ms. Johnson worked in the CIA's Directorate of Intelligence on Balkans issues during 1998–99. Her primary research interest, strategic culture, is the role of national and organizational cultures on the formation of security policy.

Clayton Laurie is a CIA historian. He also teaches military and intelligence history at the University of Maryland Baltimore County.

Dr. Christopher R. Moran is a research scholar at the University of Warwick. He focuses on the development of government secrecy in Cold War Britain. Interests include spy fiction and growth of intelligence communities in the 20th century.

Hayden Peake is curator of the CIA Historical Intelligence Collection. He has served in the CIA's Directorates of Science and Technology and the Directorate of Operations.

Matthew P. is a clandestine service officer assigned to the CIA History Staff.

Dennis Wilder is a senior officer in the CIA's Directorate of Intelligence. He has served as an analyst, a manager of analysts, a Special Assistant to the President and Senior East Asia Director on the National Security Council, and a senior reviewer of the President's Daily Briefing.

On the Web:

John P. Finnegan was a US Army historian who focused on military intelligence history. He died two years after his unclassified article appeared in a classified issue of *Studies* in 2000. Unfortunately, it was not extracted for an unclassified issue at the time.

Cultural Topography: A New Research Tool for Intelligence Analysis

Jeannie L. Johnson and Matthew T. Berrett

> ***"American decisionmakers have shown a need for help in isolating and understanding the complexity, weight, and relevance of culture as they consider foreign policy initiatives."***

In the third edition of his "History of the World," J.M. Roberts notes that "Historical inertia is easily underrated…the historical forces molding the outlook of Americans, Russians, and Chinese for centuries before the words capitalism and communism were invented are easy still to overlook."[1] In this article, Jeannie Johnson and I offer a variation on Roberts's view: Cultural inertia is easily underrated, and American decisionmakers have shown a need for help in isolating and understanding the complexity, weight, and relevance of culture as they consider foreign policy initiatives.

The view I bring to this discussion is not one of an anthropologist but rather one of a former economic analyst in US intelligence who has been a senior manager of analysts in various disciplines for a decade. My analytic and management positions have repeatedly brought me into indirect and sometimes direct interaction with top-level US decisionmakers including several US presidents. As I witnessed these decisionmakers in action and tried to help deliver insights they needed, I came to conclude that the "inertia of culture" was often underrated in their assessments of opportunities and obstacles, in part because few if any of their information sources offered a systematic and persuasive methodology for addressing this inertia and its implications for their policy options. I also came to conclude from direct observation and some readings out of the academic field of strategic culture that America's cultural view features the notion that Americans can achieve anything anywhere including going to the moon—if they just invest enough resources.

This notion is understandable but perhaps hazardous. America's remarkable history of achievement includes being the first nation actually to go to the moon, but the we-can-do-anything part of American self-identity also leads some to argue still that US failures in

The endnotes and an appendix are available in the digital version of the article in cia.gov.

All statements of fact, opinion, or analysis expressed in this article are those of the author. Nothing in the article should be construed as asserting or implying US government endorsement of its factual statements and interpretations.

Vietnam were not the consequence of a poorly managed investment; they were the consequences of investing too little.[2] How many resources and over what period would have been sufficient to strike "success"—particularly if success would have required changes in Vietnam at the cultural level? I have rarely seen American policymakers ask "Will our desired foreign policy outcome require change over there at the cultural level? Over what period and with what resources is such cultural change achievable?"

The more I observed the policy-intelligence dynamic, the more I perceived a need for an analytic construct designed exclusively to illustrate clearly and persuasively the inertia of culture. Cultural influences are typically touched on within US Intelligence Community (IC) analyses as peripheral factors, described with passing references, and often in general and superficial terms. Although the IC is full of world-class expertise on foreign peoples, places, and organizations, this industry rarely isolates and illustrates culture as a factor deserving its own sophisticated and thorough treatment.

To remedy this perceived deficiency, I teamed with Jeannie Johnson—formerly an intelligence analyst at CIA and now with Utah State University—who had brought her academic training in strategic culture to a pursuit similar to mine. For some time she had been amassing training ideas in the area of cultural analysis for IC experts, and our combined efforts, along with significant input from other members of my former office,[3] trial runs of intelligence products, research, and continued refinements over the past four years have resulted in a process we call "Cultural Mapping." This process, or methodology, is designed to isolate and assess cultural factors at play on issues of intelligence interest and to distinguish the degree to which those factors influence decisionmaking and outcomes. Mapping exercises done across time, spanning multiple issues, and on diverse groups within a society may aid in understanding that society's "Cultural Topography." We describe the process below.-mtb

---

Target Audience: Intelligence Analysts

Understanding this methodology and its specific structure requires a grasp of the users for whom it was designed: intelligence analysts. Anthropologist Rob Johnston was hired in the wake of 9/11 to complete an ethnographic analysis of the IC's analytic cadre and to offer suggestions for improving its performance. He observed biases produced by both ethnocentrism and expertise, which resulted in rather serious cognitive gaps, and he noted a lack of systematic tools for going after cultural data.[4]

Johnston defines ethnocentrism as the tendency to project "one's own cognition and norms onto others." Intuition, a compass regularly employed by career analysts, is culturally encoded and, by nature, ethnocentric. Johnston warns of its use as a barometer for analyzing or predicting the behavior of foreign agents.[5] According to Edward Stewart and Milton Bennett, American cultural tendencies are particularly unhelpful in this regard. Despite vast information resources and exposure to exotic cultures, Americans continue to overemphasize similarity and assume that other social groups have values and aspirations in line with their own.[6]

It may seem counterintuitive to see expertise as a source of bias but Johnston points out that "becoming an expert requires a significant number of years viewing the world through the lens of one specific domain. This concentration gives the expert the power to recognize patterns, perform tasks, and solve problems, but it also focuses the expert's attention on one domain to the exclusion of others."[7]

Johnston's cautionary counsel regarding the habits of experts echoes that penned by Richards Heuer two decades earlier:

> *Once people have started thinking about a problem one way, the same mental circuits or pathways get activated and strengthened each time they think about it. This facilitates the retrieval of informa-*

tion. These same pathways, however, also become the mental ruts that make it difficult to reorganize the information mentally so as to see it from a different perspective.[8]

A third form of observed bias among analysts, which might be added to Johnston's list, has roots in academic training and is an institutional legacy that tends to leave culture out in the "all-source" approach to analysis. The academic backgrounds of most intelligence analysts stem from disciplines that emphasize power and wealth as the primary human motivators, leaving underexplored other motivators such as identity, preservation of social institutions, alternative value structures, powerful narratives, or perceptions of the security environment distinctive to a person's or group's region and history. Due to institutional habits, the educational paradigms of many of our experts, and the reticence of members of the anthropological community to accept positions within US security institutions, culture has received limited attention as a variable. Most analysts have simply not been introduced to the training or the research tools for going after cultural data effectively.

This bias also affects intelligence collection, which aims disproportionately at foreign

Despite vast information resources and exposure to exotic cultures, Americans continue to overemphasize similarity and assume that other social groups have values and aspirations in line with their own.

leaders and the elite cadres that surround them. We have, institutionally, very few tools aimed at understanding national populations or specific subcultures, a point General Michael Flynn made in his public rebuke of intelligence practices in Afghanistan in January 2010.[9] The emphasis on elites has produced cognitive gaps in our analysis—perhaps illustrated anew by the surprise over the political tumult that erupted across North Africa and the Middle East in early 2011. Johnston observes:

[An] analyst, while accounting successfully for an adversary's capability, may misjudge that adversary's intention, not because of what is cognitively available, but because of what is cognitively absent. The failure to determine an adversary's intention may simply be the result of missing information or, just as likely, it may be the result of missing hypotheses or mental models about an adversary's potential behavior.[10]

Noting that the lack of cultural data in mental models is a problem not only for analysts but also for the policymakers they support, Johnston exhorts:

Specific cultural knowledge is a skill and the foundation for forecasting the behavior and decisionmaking of foreign actors. Acquiring cultural knowledge should be taken as seriously as learning any other facet of one's analytic capabilities. Moreover, it is incumbent on analysts to educate their own leadership and policymakers about the value and utility of cultural knowledge for intelligence analysis.[11]

Johnston's advice may sound rather obvious, but given the scope and complexity of the phenomenon we call "culture," attempting its research and determining—with no prior training in this field—which aspects have policy relevance can be an intimidating task even for the most talented political, economic, or military analyst. Interviews with analysts have often revealed a sense of being overwhelmed by the scope of cultural data that are relevant to their accounts—and of dismay at the length and depth of the historical knowledge necessary to capture a grand strategic profile of any region or group. One reaction is to subconsciously search for reasons why cultural data are not necessary—a position that ana-

Interviews with analysts have often revealed a sense of being overwhelmed by the scope of cultural data that are relevant to their accounts, and of dismay at the length and depth of the historical knowledge necessary to capture a grand strategic profile of any region or group.

lysts schooled in the international relations paradigms of realism and neorealism are already trained to take.

Analysts also face institutional obstacles to in-depth cultural study. The organizations they work for are required to produce large volumes of often tactical pieces on a daily basis. For some analytic assignments, this pace can be relentless. IC institutions simply do not have the manpower to pursue the type of cultural research employed by professional anthropologists: living in the region for extended periods in order to conduct ethnography (participant observation) and to refine fluency in the local language. Many analysts move from one account to another during their careers and must conduct cultural research via short-term stays in theater, brief stints of language training, and information that can be accessed from their desk or in library holdings.

Given this particular organizational backdrop, our aims have been modest but effective, we hope, in moving cultural research and analysis forward within the community. Our research tool is designed to broaden the IC's grasp of the factors that drive outcomes, specifically cultural factors, and to help IC analysts be creative in their collection of cultural data. We make no attempt to deliver the end point or last word in cultural research. What we offer is an accessible research tool that can produce systematic, sophisticated surveys of cultural variables, a grasp of which can greatly help US policymakers achieve desired outcomes and avoid surprises.

Research Philosophy

Our experience in marrying cultural data and analysis to the daily demands of defense and intelligence analysis has led to a few conclusions about best practice. The most overriding of these is that sweeping cultural profiles of a region or a national group are of limited value in the intelligence industry for a number of reasons. As has been effectively argued by Christopher Twomey, security studies that attempt to draw predictive power from the amorphous and often internally contradictory substance we call "national culture" often suffer follies of overgeneralization and static analysis, and they reach, as a consequence, questionable conclusions about the sources of security policy.[12] Patrick Porter heaps heavy criticism on many of the West's nascent efforts at cultural analysis for making this mistake. He accuses military and intelligence analysts of drawing static portraits of Eastern cultures rather than recognizing them as moving, flexing, human creations—and, in so doing, introducing dangerous sources of error.[a 13]

To reference "culture" in the singular for any particular polity is typically an error; there is rarely just one internal variety. Walter Russell Mead identifies four distinct narratives within US strategic culture and posits that our various foreign policies are formed from the "collisions and debates" those narratives inspire.[14] The idea of composite cultures is not restricted to analysis of the US, of course. Authors writing on Germany, China, India, and Iran, to name a few, all note the internal conflict of competing cultural narratives about national security within these countries.[15] The existence of

[a] Porter's warnings are valid but may be a bit overstated. Today's Department of Defense is not entirely uninitiated in doctrines of cultural change. Leading-edge training methods emphasize "practice theory"—an approach to culture which treats the change dynamic as central. Practice theory explains culture as a product of interaction between agent and structure and trains analysts to expect change rather than stasis.

multiple cultures is present not only at the national level; it is true right down to the ordinary individual. As Kevin Avruch quips, "for any individual, culture always comes in the plural."[16] The cultural influences at play on a single actor could derive from a background that features Northern European, Catholic, engineering school, and family-specific influences.

Most academic work examining the impact of culture on security policy mirrors the biases of the IC by privileging elite-level culture (usually at the organizational level) over other types. The typical justification of this approach is that while public opinion may play a peripheral role, "it is arguably the elite—owing to its role as gatekeeper, its expert knowledge and its privileged access to means of communication—that ultimately decides which way security policy goes."[17] But this logic breaks down when one is assessing the impact of culture within the context of counterinsurgency and stability operations, for instance. Given the pivotal role of local popular opinion in this type of military engagement, understanding public culture, the cultures of significant substate groups, and how these affect security policy becomes paramount.

The research method presented here asks analysts to step outside the biases of the institutional and academic work already done on their topic and assess afresh which actors and cultural influences are most relevant for the policy issue they are researching. In some cases this may be a vastly understudied section of the population, one which has received little attention within official channels, and one whose research will require unorthodox (for the institution) survey and collection methods.

Most academic work examining the impact of culture on security policy mirrors the biases of the IC by privileging elite-level culture (usually at the organizational level) over other types.

Culture at any level—organizational, tribal, ethnic, regional, or national—is a dynamic human creation and subject to change, but this should not discourage analysts from its study. Any tool devised to track cultural influences must employ questions that challenge previous assumptions, unearth fresh data, and highlight possible areas of change, but as Barak A. Salmoni and Paula Holmes-Eber remind Marines who may be intimidated by the complexity and movement of the cultures they are studying:

> *Although people are, by nature, variable and unpredictable, they still need to work with others in social and cultural groups. These groups —and their associated beliefs and structures—are organized according to logical, understandable principles that every person living in the culture must understand, at least intuitively, in order to get along with each other. With some basic study,* [others] *can also recognize and understand these principles and apply that understanding to their operations.*[18]

It is with our specific audience and these basic assumptions about culture in mind that we constructed the Cultural Mapping method. It is presented here in the step-by-step process we have provided recently to groups of analysts.

Cultural Mapping Exercise

Step 1: Identify an Issue of Intelligence Interest

The first injunction to analysts is to narrow the scope of cultural inquiry by isolating a particular policy question of interest. The narrower the issue, the more targeted the cultural research, and the more likely it will yield actionable data. The issue selected may reflect a frequently asked question that needs examining from a new angle, or a question that policymakers are not asking—perhaps due to ethnocentric blinders, habit, or limited

knowledge of the region—but should be.

Step 2: Select an Actor

Analysts are urged in the this step to isolate a particular population for study. All "players" within this issue arena are identified for consideration, stretching to include some not typically examined. A sampling of possible actors might include prosperous urban elites, an ethnic subgroup, a particular government institution, a dissident group, a village council, housewives across a region, a youth bulge, or the cadre around a leadership figure. From among these subgroups, or actors, one is selected for focused study. This actor may be the one expected to play the most pivotal role in a particular outcome on the issue selected or one that is dangerously understudied and may present a wild card for the future.

The actor in question need not have a discernible "group culture." The important question here is not "what is this actor's culture?" but rather "what cultural influences will weigh in on decisionmaking on this issue for members of this group?"

The mapping exercise is designed as a looping process. The actor who seems most relevant initially may fade into the background as research progresses and the salience of other actors becomes apparent. Conversely, the initial actor may remain of interest but emerge as a far more complex entity once research magnifies group properties. Analysts are invited to loop back to this stage after an initial round of research in order to disaggregate, refine, or switch actor sets in a way most profitable for intelligence analysis.

Continued refinement occurs to the central policy question as well. Analysts may find that they were as captive to ethnocentric blinders as the clients they serve when crafting the initial intelligence question. Looped-back refinements on this front are to be expected.

Step 3: Amass a Range of Cultural Influences

Assuming Avruch's logic that all individuals and groups possess culture in the plural, analysts are asked to map out the various cultural influences which may guide the behavior of members of this group—again, *within the context of the issue they are assessing.* These influences range from the local, such as clan, tribal, or organizational cultures, to wider cultural influences, such as regional, ethnic, religious, national, gendered, socioeconomic, or generational. Analysts need not confine themselves to fleshing out "typical" cultural influence sets but rather think expansively and creatively about the specific group they are studying.

New forms of social media have norms embedded and learned by new users; a leadership cadre hailing from a similar educational institution may espouse a common view of how the world works; and foreign youth who work part time at America's franchises may be internalizing a strong dose of capitalist work ethic. We encourage analysts to consider all plausible influences initially, pursuing this as an exploratory stage. Decisions about which influences are most relevant will come later.

Step 4: Explore the Cultural Data from Four Perspectives

In order to supply structure to the cultural exploration encouraged in Step 3, we suggest the following four categories for assessing cultural data: *Identity, Norms, Values*, and *Perceptual Lens*. This is not an exhaustive list of important cultural factors but is a useful starting point in examining culture from four policy relevant perspectives. The categories are distinctive enough from one another to inspire different sets of questions and elastic enough to capture a wide range of data:

***Identity*:** The character traits the group assigns to itself, the reputation it pursues, and individual roles and statuses it designates to members.

***Norms*:** Accepted and expected modes of behavior.

***Values*:** Material or ideational goods that are honored or that confer increased status to members.

***Perceptual Lens*:** The filter through which this group determines "facts" about others.

Unearthing and isolating factors that might be captured as identity, norms, values, and perceptual lens is a messy business.

Analysts receive an in-depth list of questions for each category.[a] The magnitude of cultural data unearthed in answering the questions in these four categories may be managed by keeping a litmus test for policy relevance in mind. An initial short list of questions might examine the issue selected in Step 1 in the ways below.

Identity.

- Which factors surrounding this issue would cause this actor's identity to be threatened? Alternatively, which might provide the US common ground for co-option?
- Is group cohesion strong along identity lines in response to this issue? What would cause the group to fracture or to unite behind a common front?
- What individual roles and statuses might group members seek to protect?

Norms.

- Does this issue place social institutions or common practices under threat?
- Which practices are deeply internalized and likely to inspire resistance?
- Which practices are compatible with US interests on this issue?
- Would our proposed changes in this policy area offer group members a way out of increasingly unpopular normative practices? Which members?

Values.

- What is considered "honorable" behavior in this issue area?
- Which local values may be in conflict with our approach to this issue?
- Which values might be co-opted in moving US interests forward?
- Where might value differences between target groups present an opportunity to exploit cleavages?

***Perceptual Lens*:**

- What are the preconceived notions of this group concerning the behavior and character of the United States?
- What are group's beliefs about the future?
- What hurdles must we overcome in messaging to this group on this issue?

This tidy and rather simple list of questions may provide the false impression that the answers are readily apparent and attainable. The reality is that unearthing and isolating factors that might be captured as identity, norms, values, and perceptual lens is a messy business. It involves doing heavy amounts of open-source reading, using the research skills honed in graduate school (rather than the typical day-to-day practices of the intelligence business), and wading through a lot of data of questionable relevance.

Most analysts need to take themselves off-line for a period in order to accomplish this task with any effectiveness. This sort of research does not mix well with the often frenetic pace of producing current intelligence. Some offices have been particularly proactive in this regard and have offered their analysts short sabbaticals in order to get them away from their desks. These intelligence officers remove themselves to a separate location—in most instances to an institution with significant holdings on their area of interest—to conduct research. Other offices have assigned analysts into research or methodology teams where they can focus on a long-term research endeavor with the necessary consistency.

[a] The questions are contained in an appendix available in digital versions of this article.

Most analysts need to take themselves off-line for a period in order to accomplish this task with any effectiveness.

After immersing themselves in what cultural data is available through official channels, open-source searches, and (ideally) visits to the region, analysts begin to identify cognitive gaps in previous modes of analysis. In addition to benefitting from new data accumulated on their account, they become far more attuned to what they don't know—what information the institution is not collecting. Identifying key knowledge gaps means coming up with creative solutions for going after the target data. Time constraints limit the ability of intelligence analysts to employ extended ethnography as a tool, and institutional restraints can limit the ability to employ methods pursued by academic or other institutions. The following is a collection of cultural research strategies proffered by a variety of analysts representing the full range of experience, with some residing in academic venues and others in policymaking forums.

Historical Narratives

Nearly all analysts begin with the assumption that one must conduct a thorough background investigation to become familiar with a regime's history, geography, internal social codes, and general interactions with other states. If not conducted with strategic efficiency, this task can be overwhelming. One way to gauge those aspects of history relevant to the issue being tracked is to pay attention to historic references made when the policy issue is addressed, whether in political rhetoric, private conversation, lessons in school, or expressions from the artistic community. Which narratives do politicians draw on to legitimize their behavior on this issue and to pacify the public? Which narratives work? Which do not?

Physical manifestations such as architecture, street names, statues, and memorials demonstrate which aspects of a nation's history it chooses to preserve and celebrate. Finding and understanding the selection of heroes, for example, lends itself to understanding national values.[19] Of particular interest are those symbols that people voluntarily display in their homes.[20]

Understanding historic narratives can be critical to making sense of the strategic choices of foreign populations. The 1999 bombing campaign against Serbia supplies an example. US analysts vastly underestimated the duration and expense of the 1999 engagement, in part because they undervalued the role of historic narratives of victory and defeat. Serbia's national holiday is not a celebration of a past battlefield victory but of a glorious defeat in 1389 at the hands of the Ottoman Turks. Serbs celebrate the valor of the war's hero, Prince Lazar, who received a heavenly visitation on the eve of battle and was told that unless he surrendered he faced certain defeat the next day. Given the choice, Lazar declared that it was better to die in battle than to live in shame.[21] He did precisely that—and became cemented in Serbian legend.

This tale permeates Serbian society. It is taught to youngsters in school and is represented in homes and offices in the renowned painting "Kosovo Girl." Most analysts working this issue were familiar with these aspects of Serbian culture but lacked a method for tracking and weighing them systematically and thus acquiring the footing necessary to articulate persuasively to policymakers the potential impact on Serbian behavior: that is, that Serbia would find victory by standing up to an overpowering military force when the world expected it to fold.

Understanding the weight of this narrative for Serbs in defining honorable conduct during war would probably have disabused planners of the idea that the bombing campaign would be over quickly. Instead of projecting a three-day campaign, we might have helped policymakers plan for a cam-

paign closer to the almost 80 days it eventually took.[22]

Tapping into the Population

Useful interaction with the population under survey can range from rudimentary (daily records of anecdotal interaction) to highly institutionalized methods (sophisticated polling conducted nationwide).[23] One popular method for both institutions and individual researchers is targeted focus groups. Much has been written on this particular survey technique, but the advice of analysts in the field is that effective focus groups must be preceded by an in-depth study of the issue at hand so that the interviewer can select a sampling of *relevant* focus group participants and frame questions appropriately.[24]

One selection device employed by ethnographers is to narrow interviews to "key informants" of local culture.[25] Key informants can range from subject matter experts to those who are cynical about their own culture and are therefore observant, reflective, and articulate.[a 26]

A variation on key informants is "key keepers" of culture. These people are defined by frequent contact and extended conversation with other members of the community. As a result, the key keepers tend to harbor the notions, language modes, and perceptual lens of the local community.[27] A key keeper may be institutional. In determining core values within Israeli society, Greg Giles looked first to shared, institutionalized socialization processes. He pinpointed the Israeli Defense Force (IDF) since universal conscription requires that all Israeli citizens experience socialization and training through this institution. Giles points out that it is not just contact with the institution that matters, but institutional legitimacy. The IDF meets these criteria based on the high number of young people polled who said they would be willing to serve in the IDF even if it were an all-volunteer force.[28]

Useful interaction with the population under survey can range from rudimentary (daily records of anecdotal interaction) to highly institutionalized methods (sophisticated polling conducted nationwide).

An important window into norms and the color of a group's perceptive lens is the "conventional wisdom"—the things "everybody knows."[29] Compiling and analyzing oral traditions may take a number of different forms. The author of a recent popular survey of Iran attempted to do this by engaging in dialogue with persons from a sampling of all of the society's castes and factions and starting each conversation with the same request: "Tell me your story."[30] The patterns and themes developed across conversations helped uncover generally accepted notions about self and others. Additional probing may reveal notions of identity—what is taken for granted as a natural role for the nation, what is expected, and what is controversial.[31]

One inventive young scholar from Monterey's Naval Postgraduate School proposed an alternative to official polling—the systematic study of "RUMINT" (rumor intelligence).[32] She surveyed and prioritized the issues on the minds of Iraqis by tracking the frequency of rumors that appeared in local print. One of her findings, a surprise for US forces at the time, was that a large swath of Iraqis believed the United States was *behind* the insurgency. Their belief stemmed not so much from an assumption that the United States was malicious but from the perception that it was impossible that a superpower with the might of America could not stop the insurgency if it wanted to. Therefore, the United States must be behind it. Her work produced a number of timely insights for US

[a] Bernard claims that cynical informants have consistently been his best sources over the years.

Those not in-theater could use alternative approaches to tracking gossip networks.

officials concerning Iraqi attitudes and priorities.

Those not in-theater could use alternative approaches to tracking gossip networks. Dr. Deborah Wheeler, a specialist in Middle East studies, has focused her research on online discussions across her region—particularly among women who otherwise do not speak out. Chat rooms and editorials posted in pseudonymous blogs may be one way to evaluate the thinking of otherwise reticent populations.[33] Christine Fair, an analyst writing on Iran, suggests another alternative to firsthand interviews with citizens of a repressive regime:

> *Utiliz*[e] *consulates of countries where Iranians seek US visas (India and Turkey) to collect and develop information during the visa interview process. Defense attachés may also engage their in-country counterparts in countries where military cooperation with Iran are ongoing to gain insights into Iran.*[34]

Expatriates are a self-selected group, often coming from within a limited segment of society not representative of the broader base. Despite this sampling drawback, interviews with this group offer some value. Students from the region of interest living abroad are often better at identifying beliefs and norms in their home lands than fellow citizens left behind because the students have experienced the contrast between their national beliefs and those of people in their host countries.[35]

Secondhand interviews—interviewing those who frequently interact with members of the culture—are also very useful, especially in cases where the populace does not feel comfortable speaking openly about its thoughts and opinions.[36] In some cases it is politically incorrect to speak of one's historic culture, especially where security policy is concerned, so there is an absence of civil or political rhetoric on the topic. Rodney Jones notes the case of Japan, where Jesuit priests who lived there for extended periods were more likely than Japanese statesmen to speak freely of Japan's history and predilections.[37]

Joe Bermudez, a longtime Korea analyst, notes that when information is hard to come by, as it is with North Korea, even interviews with travelers and a careful look at their photographs can prove beneficial. In North Korea's case, it helps unveil the genuine state of affairs for the state's population (regarding, for example, roads, electricity, phone service, and health conditions) in contrast to state claims about its situation.[38]

Content Analysis of Texts

When evaluating national-level cultural threads, texts taught in school deserve special attention. Classroom textbooks explain perceptions of a nation's own history, its view of others, acceptable methods of warfare, and common justifications for past behavior (norms). Societal values are taught to children explicitly, particularly in the early stages of education. Their texts may include hero legends, songs, rhymes, fables and oversimplified anecdotes from the nation's history.[39] Valuable cultural or political insights can be drawn from noting which figures are celebrated, which are despised, and why.[40] Education and other socialization processes also result in a body of shared literature considered "classic." What are the messages in this body of work? How widely are the classics read? How often are they referenced?[41]

Military texts are essential sources of information on the values, identity, and acceptable methods of achieving security within a regime. Twomey recommends a deep survey of all sorts of doctrinal texts—telegrams, military orders, descriptions of training regimens, diaries, memoirs, and communications between military leaders.[42] This study would

Military texts are essential sources of information on the values, identity, and acceptable methods of achieving security within a regime.

reveal national aspirations over time (identity), accepted norms for achieving them, and perhaps more particular values such as views on the use of manpower and loss of life.[43]

Tracking Political Rhetoric

The key to analyzing political rhetoric effectively is understanding, in local context, the role it plays in communicating with the population of interest. Russia analyst Fritz Ermarth notes that a first step in weighing the value of political rhetoric within a nation is to track its correlation with actual behavior in the past. Tracking over time and across politicians may yield useful generalizations about government speeches as indicators of sincere goals and security objectives.[44] On China, Twomey points out that the culture tends to weigh private comments more heavily than public statements and that inflammatory public statements need to be qualified accordingly.[45]

Once understood, public rhetoric may represent a rich data field for assessing norm strength or identity trends. The work of Andrew Cortell and James Davis, as well as that of Paul Kowert and Jeffrey Legro, suggests measuring a norm's strength by the frequency with which it is referenced by statesmen proposing a course of action or legitimizing one already taken.[46] On the identity front, Glenn Chafetz, Hillel Abramson, and Suzette Grillot employ content analysis of leaders' speeches in order to explain the weapons acquisitions patterns of diverse states. Their research presents a strong correlation between four identity typologies and a "marked tendency toward nuclear acquisition."[47] The method Chafetz et al. suggest for coding role conception can easily be duplicated for other issues.

Extended Observation of Public Behavior

Public reactions to the moves made by state leadership may highlight areas of congruence or cleavage between the understanding of values and norms fostered by the populace and the behavior of state officers. Disaffection may come in the form of protest, local grumbling, or biting humor pointed at political officials, while congruence might manifest itself through strong turnout for state events and parades, voluntary displays of state insignia, or healthy membership in state-related organizations.[48] Congruence or cleavage between separate identity groups may be manifest in part by the degree to which the target group is willing to accumulate and incorporate traditions of food, dress, verbal expression, names given to children, and entertainments originating elsewhere.[49]

In order to understand identity distinctions within large regions, one might systematically observe social ceremonies and rituals. What is the purpose of the ceremony? Who attends?[50] Which norms violations are publicly punished? Which achievements publicly celebrated? One daily ritual that often sheds light on identity and value structure is the protocol of salutations, especially in conversations between members of the population meeting for the first time. How does one introduce oneself? Is it by way of profession, clan ties, or religious affiliation?[51] Which aspects of personal identity are most valued?

Humor can serve as a useful test for one's grasp of the culture under study. What does this group find funny? Why? Which alternative group is consistently used as the object of ridicule? Which of the alternative group's characteristics are subjected to mockery? How does this illuminate the values of the group being tracked? What does it say about their perception of others?

Language is an indispensable source of cultural information. Not every analyst is going to have the opportunity to become

Entertainment media provides valuable insights for those seeking to understand the current state of a particular set of norms within a society.

fluent in the local tongue but will find that pursuing even novice-level language competence may yield cultural insights. Concepts that a population values are often assigned more words than those that are not. Recent research suggests that language has a profound impact on our perceptual lens. It registers the content of our memories—the aspects of reality that we record, and how we record them.[52]

Evaluating the Output of the Media and the Artistic Community

Depending on the level of independence enjoyed by news, entertainment, and artistic producers within a population, these may yield significant insight into a group's identity and its core norms and values. Twomey notes the onerous level of work involved in a comprehensive review of these sources and commends two authors who have tackled it: Peter Hays Gries on China, and Ted Hopf, on Russia.[53] Even completely controlled media may still offer material for cultural analysis. State propaganda illuminates the identity, norms, and values that the state hopes to achieve, as well as the narrative it hopes will dominate popular perception.

In a free society, the bounds and content of political debates channeled through the press can identify not only cleavages in the strategic and political culture but also points of popular congruence.[54] Sometimes what is *not* addressed is as interesting as what is. Christopher Meyer and Adrian Zdrada isolated a pronounced identity aspect to Poland's willingness to ally with the United States in our runup to the invasion of Iraq in 2003 through content analysis of press debates on the issue. Their research revealed an absence of serious security discussions relating to Iraq and strong emphasis on establishing Polish identity as a reliable US partner. The identity basis of Poland's participation helps explain why the failure to unearth weapons of mass destruction in the Iraqi theater did not diminish the enthusiasm for the US alliance in Poland as it did in Great Britain.[55]

Free media may also serve as a reliable watchdog for norms violations within the state. For example, the flurry of reporting in the United States on excesses in Guantanamo and at Abu Ghraib manifest norms violations that are considered serious and newsworthy in the United States but may not have been treated that way in other countries. As commercial organizations, media outlets must present a worldview comfortable to their audience. The worldview captured in newscasts validating (especially controversial) state actions may illuminate popular perspectives and narratives that more formal instruments for measuring opinion would miss.[56]

Entertainment media provides valuable insights for those seeking to understand the current state of a particular set of norms within a society. The fabric of television sitcoms is the exaggerated presentation of social *faux pas* and situational conundrums.[57] Sitcoms are also a helpful reference for illustrating a culture's typical problem-solving devices and for illuminating changes underway in society by poking fun at norms that are in flux. TV dramas serve a different purpose—they most often focus on norms violations that are serious enough to be considered tragedy and represent a shared core of values across the society.

Step 5: Assemble Critical Cultural Factors

After analysts have worked to fill cognitive gaps and amassed a sizeable accumulation of cultural data, they are then presented with the painful task of setting much of it aside—honing their data down to those cultural factors that are likely to play a role in the decision-making of *this group* on *this*

issue. The analyst's instructions are to evaluate each cultural factor according to:

- ***Relevance*** for the issue selected.
- ***Robustness*** of the factor. [a] 58
  - How well established is it?
  - How widely shared is it among members of this group?
  - To what extent is opinion or behavior that is inconsistent with this aspect of identity, norms, values, or perceptual lens rewarded or punished internally by other members of this group?
- Likelihood of this cultural factor to provoke a ***Response*** (cooperative or conflictual) when external actors engage this group on this issue**.**

The cultural factors that emerge from this rigorous culling process are the Critical Cultural Factors (CCFs) for this group on this issue and will be the concepts that are addressed in the finished intelligence product. In intelligence terms, each factor must be solidly connected to a "so-what." What impact is it likely to have on outcomes of interest to US policymakers? To what degree are we confident that behavior will reflect this cultural influence? How many types of research sources or methods validate this finding?

The cultural factors that emerge from this rigorous culling process are the Critical Cultural Factors (CCFs).

Step 6: Mapping

After an analyst has isolated the relevant set of CCFs, she is asked to map the primary source of each from among the various cultural influences identified in Step 3 (national, ethnic, tribal, professional, etc.). Are the identity components on the CCFs list confined primarily to one domain (i.e., tribal), or shared across other sources of cultural influence (i.e., ethnic and religious)? What about critical norms and values? What about critical aspects of the group's perceptual lens?

The purpose of this portion of the mapping exercise is to define—for the analyst as well as the eventual audience of her intelligence product—the influence boundaries of the CCFs. Are they spread across the cultural landscape or confined to one or two key cultural influences? Is there a clear, somewhat bounded, cultural force at play on this issue (i.e., tribal, sectarian, professional/organizational), or are cultural influences widely dispersed and unlikely to provide anything close to a clear script for action?

Step 7: Writing the Paper

Based on the outcome of the mapping exercise, a finished Cultural Topography paper will define for the reader first, which aspects of identity, norms, values and perceptual lens are most important to understand when the United States engages this actor on this issue, and second, the probable influence boundaries of the CCFs identified. These CCFs provide the primary focus of the paper. The paper answers, in specific terms, the following questions:

- Which CCFs represent points of possible leverage and cooperation?
- Which CCF red lines are likely to spark resistance or even armed conflict between foreign elites and their broader populations or between foreign populations and US actors?

[a] The work of Jeffrey Legro may serve as a useful reference point for this task. He has written extensively on measurement of norm strength and his work on norms probably has some transferability to identity, values and perceptual lens. He proposes that a norm be evaluated according to three criteria: how clearly it is recorded in the rules of society (specificity), how long it has existed within this society and its strength in standing up to normative competitors (durability), and how widely it is accepted and referenced in discourse (concordance).

A handful of papers based on the Cultural Topography methodology have been produced, but they have prompted reaction to suggest the method offers a way to add analytic value.

- Do most of the CCFs stem from one cultural tradition or source of influence (i.e., ethnic, religious, tribal)? If so, what else do we need to know about this cultural domain in order to acquire adequate context for understanding the CCFs in question?
- Are the members of the group under study drawing from multiple cultural traditions/influences when they respond to this issue? Will it cause them to fracture when pressure is exerted on the myriad aspects of this issue?
- To what extent do adversarial groups in the region share the same cultural mapping on this issue as the group under study, reflecting common sources of cultural influence? Where is this not the case? How does that inform forecasting on future cooperation or divergence between these groups?
- Within which tradition will our messages to this group on this issue be most persuasive?
- How likely are other groups across the region to respond in similar fashion when presented with this issue?

Initial Impact of Cultural Topography

Only a handful of papers based on the Cultural Topography methodology have been produced, but they have prompted sufficient reaction to indicate that the insights they offer get beyond the general body of information already grasped by most analysts and policymakers, and early reactions to such insights suggest that the methodology offers a way to add analytic value:

- In a meeting that was part of a US policy review on a specific country, an attendee not familiar with this methodology reported that several analysts, authors of a Cultural Topography paper on this country, "quickly proved themselves to be as smart or smarter on [country of focus] than anyone else in the room…on history, ethnic topography." It is worth adding that the room was filled with experts who had spent significantly more years on the subject than had these analysts.
- While traveling abroad, a special envoy with significant expertise selected one of the Cultural Topography papers as one of only two items—from a large pile of intelligence materials—he wanted sent back to his office for further study. Several senior commanders also expressed significant interest in this paper.

Additional reactions have been consistent with those noted above, but only the continued application and refinement of this tool will fully display whether its potential is great or limited. The methodology is being taught in at least one IC institution, and several new Cultural Topography papers are in motion now. The main challenge to pursuing and exploiting this approach within the IC is the pressure of daily production driven mostly by conventional collection and analysis. Cultural Topography holds no promise of advancing the understanding of cultural influences on foreign perceptions and actions unless researchers are given the time to find additional, often novel data and then to incorporate them into the tool.

Appendix A

Cultural Analysis

Concepts and Questions

Identity

- Is individual identity seen as comprising one's distinct, unique self, or is it bound up in a larger group (family, clan, tribe)?[59]
- Does this group see itself as responsible for and capable of solving social problems? Are problems responded to with energy or left to fate?
- Which myths and national narratives compose the stories everyone knows? How do these speak about group identity?
- What is this group's origin story? Does it inform group members of their destiny?
- What would this group list as defining traits of its national, tribal, ethnic character?
- Is one aspect of identity being overplayed, not because it is foundational for most decisions but because it is being threatened or diminished?

Values

- For the linguist, which concepts/things are described in nuanced ways (meaning that many words have been assigned to them)? Which concepts are missing from the language? (For example, the concept of "fair play" is hard to find outside of English.)
- What generates hope in this population?
- Which is viewed more highly as a communicative tool—emotion or logic? Are conversational styles which emphasize logic viewed as trustworthy?
- Is conspicuous consumption valued as a status marker? If not, what incentives exist to work hard?
- To what extent do security concerns trump liberty concerns in this society? Which parts of liberty are deemed attractive?
- Is social mobility considered a good thing, or is it deemed disruptive to a highly organized system? Would this group fight to keep a hierarchical arrangement even if offered opportunities for egalitarianism?
- To what extent does loyalty trump economic advantage?
- Which is more value-laden for this group—"progress" or "tradition"?
- Is optimism rewarded as a character trait or is it considered naive, juvenile, and possibly dangerous?
- Which character qualities are consistently praised?
- What composes the "good life"?
- What sorts of myths, hero figures, segments of history, or identity markers does the material culture celebrate? What is revealed by the decorations in homes, modes of dress, food eaten (or not eaten), monuments respected (as opposed to those covered with graffiti), gifts given, etc.?

•In describing a proposed project, what will "impress" this audience? The project's size? Its historical relevance? The technology used to produce it? How might new projects best be framed in order to win popular support?

NORMS

Political

•What is considered a legitimate pathway to power? How do "heroes" in film and other popular media obtain their power? Do they act as isolated individualists or in concert with others?

•"What gives a public the comfortable feeling that the way that decisions are reached and leaders are chosen is 'right'?"[60]

•How does the group view compromise?

•Where does "genuine" law come from? (Nature? God? A constitution? Current political institutions? Imagined, future institutions? Moral conscience? A personality from the past?)

•Is adherence to state-manufactured law admired or disdained? To what extent is state law equated with "right" and "wrong"?

Social

•Is social status in this society primarily ascribed (i.e., one is born into it) or achieved? If achieved, how so?[61]

•What are the primary markers of a person of high rank in this society? How would you recognize him/her? Does political power or intellectual prestige rank higher than economic surplus?

•What is the process for establishing trust? How does one know when it has been achieved?

•Do people perceive their own place and the dominant hierarchy as natural?

•To what extent are subordinates responsible for their own actions?[62]

•What do proverbs say about social expectations and the perceived pathway to success?

Economic

•What are the group's views on work? Which types are admired? Which are disdained? What are the economic implications?

•Which economic activities are considered immoral?

•Is it considered appropriate to "master" the natural environment and bend it to one's will?

•To what extent is the economy intertwined with kin obligations?

•What are obstacles to private property ownership?

•How does this culture group stack up when evaluated against the traits some claim are necessary for successful market economies?[63] These can include:

  •Is there trust in the individual?

  •Are wealth and resources perceived as finite or infinite? Is the focus on "what exists" or "what does not yet exist"?

  •Is competition seen as healthy or unacceptably aggressive?

  •Is this society comfortable with a questioning mind?

  •Does the education system encourage investigative learning?

- Are the "lesser virtues"—punctuality, job performance, tidiness, courtesy, efficiency – admired?
- Which are emphasized—small achievements accomplished by the end of the day (preferable for market economies) or grandiose projects (the unfinished megaworks of progress-resistant economies)?

- What is the "radius of trust" in this community? Is trust extended to family only? How far does it extend to strangers?[64]
- What are prestige commodities within this community? Why? Might these serve as stronger incentives for cooperation than direct funding?
- Is risk taking admired or negatively sanctioned? How widely spread is the "harm" of individual failure (damages family honor, potentially ignites retribution cycle, etc.)?

Security

- What defines "victory" for this group in a kinetic conflict?
- What types of battlefield behavior would result in shame?
- What level of internal destruction is acceptable?
- How do accepted myths describe this group's military history? What is its projected destiny?
- Are allies viewed as reliable, or historically treacherous? What is the resultant ethic regarding alliance loyalties?

Time/Change Orientation

- Does this group behave according to linear time? Is there a marked contrast between rural and urban regions? Do deadlines matter?[65]
- What is the future orientation of this group? Does it see itself as capable of changing the near future? Is it deemed appropriate or laudable to make aggressive efforts to do so?
- Which time frames are referenced with strong positive emotion—past or future scenarios?
- Is there a significant gap between socioeconomic expectations and reality? (This often is a precursor of social shifts.)[66]

Problem-Solving Devices

- What is the order of activities for solving a social problem (often called an action chain)? Does face-to-face confrontation happen first or last? Is violence used as a signal or is it an endgame?[67]
- How do those outside of official channels of activity (i.e. women in seclusion, youth in elder-oriented cultures) play a part in problem-solving processes?
- Which is preferred—action or deep deliberation? Is this group comfortable with trial and error as a discovery method?
- Are individuals comfortable with making a wide range of personal choices? Are individual choice and accountability practiced social norms? Would the choices present in democratic and market systems be overwhelming?
- To what extent must community consensus be reached in order for a decision to go forward?

Perceptive Lens

Cognitive processes

- What sources of information yield 'truth'? Scientific/factual processes? Dreams?[68] Inspired authority figures?

•Are most situations set into dichotomous frames? Are they made to be black and white? How comfortable are group members with situational complexity? How patient are they in working to understand it?

Of Self

•What are the basic expectations about the future? ("Poverty becomes a greater problem the moment wealth is perceived as a definite possibility.")[69] How might typical aspirations within this society be charted?

•How does this group characterize/perceive its own history? Which events are highlighted? Which are omitted?

•What does this group's history tell it about "dangerous" behaviors/circumstances for a society? (For example, Chinese—chaos, Americans—tyranny).

Of Others Generally

•How do members of this group assign intentions? What motives make the most sense to them? (If the best US intentions do not "make sense" to the host population, they will assign intentions that do. It is to our advantage to understand and then emphasize areas of cognitive congruence when embarking on joint ventures.)[70]

•What is this group's view on human nature? Are people generally trustworthy? Are they prone to excess and beset by vices, or are they able to regulate themselves? How are these views used for legitimating less or more government?

•How does this group obtain its information about the outside world? Which sources are considered most reliable? How are those sources biased or deficient?

•Are outsiders perceived as fundamentally different or fairly similar to group members?

Of the US Specifically

•What are regarded by this group as US vulnerabilities?

•What does this group believe drives Americans?[71] What do they value?

•Does this group see common ground with its American counterparts? In which areas?

•To what extent does this group believe American rhetoric matches intentions?

Cosmology (The way the world works...origin and structure of the universe)

•When explanations for events are not easily accessible, how does this group fill in the blanks?

An Educated Consumer Is Our Best Customer

Dennis C. Wilder

This essay was a recipient of the top prize in the 2010 Galileo Intelligence Community Award competition. The competition, held annually since 2004, is intended to provide active members of the Intelligence Community opportunities to put forward innovative ideas.—Editor

> ***"The quality of service a consumer receives from the IC depends heavily on the expertise and experience that the policymaker or legislator brings to their interaction with the IC."***

It may seem odd to title a paper on Intelligence Community (IC) innovation in the 21st century with the commercial slogan made famous by discount clothier Sy Syms. But this slogan holds the key to solving some of the challenges vexing IC leaders that span issues from policymaker expectations to intelligence budgets to public perceptions of the IC. At the core of this paper is the contention that we have neglected the education of our customers—defined as appointed and elected officials and the American public—to our own detriment. The quality of service consumers receive from the IC depends heavily on the expertise and experience that policymakers or legislators bring to their interaction with the IC. Our chronic failure to communicate across the policy-intelligence divide has led to pent-up frustrations on both sides and, too often, charges of intelligence failure. This proposal provides a series of recommendations for the ODNI on redesigning the policy-intelligence interface and implementing a strategic communications strategy that leverages new social media so that the American people and the policy community will better understand and appreciate the centrality of the Intelligence Community to national security.

Taking Our Customers' Knowledge of Us for Granted

Policymakers who are steeped in the ways of the Intelligence Community (IC) know how to get superior service and support. Former Acting Director of Central Intelligence John McLaughlin, from his years of experience, explained the savvy policy consumer of intelligence this way:

> *Policymakers who knew how to use intelligence generally had a realistic view of what it could and could not do. They understood, for example, that intelligence is almost*

All statements of fact, opinion, or analysis expressed in this article are those of the author. Nothing in the article should be construed as asserting or implying US government endorsement of its factual statements and interpretations.

Too often policymakers with no or little exposure to the IC, especially in the case of the novice policymakers, find themselves in a frustrating maze.

> *always more helpful in detecting trends than in predicting specific events. They knew how to ask questions that forced intelligence specialists to separate what they actually knew from what they thought. They were not intimidated by intelligence that ran counter to the prevailing policy but saw it as a useful job to thinking about their courses of action.*[1]

My observations during more than four years of service on the National Security Council have led me to conclude that policymakers with no or little exposure to the IC, especially in the case of novice policymakers, too often find themselves in a frustrating maze that involves trial and error and dead ends in their attempts to get the right kind of intelligence support. This inexperience can, and has, led to serious policymaker disappointment with IC products not because the IC did not have the correct information or analytic insights to offer, but because the consumer did not have the sophisticated understanding of IC capabilities and limitations that would allow them to ask the right questions, of the right people and at the right moment to get the best information and analysis. Frequently, this has led to charges of intelligence failures because the policymakers had unrealistic expectations of what the IC could do.

What we have is a failure to communicate across the IC-policy community divide. Gregory Treverton, a senior RAND scholar of the intelligence-policy interface had a particularly useful explanation of why IC experts typically fail to meet the expectations of eager, new policymakers out to change the course of history.

> *Intelligence analysts are reflective by nature; they want to understand…. Policy officials, by contrast, tend to be active; they want to do, not just to think. They came to Washington to signify; they want to make a difference…. If policy officers are to signify, they have to do so quickly; the average tenure of an assistant secretary is not much more than a year.*[2]

The First Customer Will Always Come First

Who are the IC's customers? Our most important customer is and will remain the president. He is well served through his direct relationship with the director of national intelligence and he, each day, receives the finest intelligence publication in the world, the *President's Daily Briefing* (PDB). The history of the PDB is one of flexibility and remarkable adaptation of support to fit each president's needs and information acquisition styles.[3]

I would argue, however, that historically we have not done justice to the rest of our customers, from policymakers below the president to the members of the US Congress to the American public, in large measure because we have neglected educational outreach and strategic communications. Without such outreach, and in a decade when massive deficits burden the national budget and the competition for resources in the federal government will intensify, we are in danger of repeating the disaster that befell us at the

end of the Cold War with the advent of the peace dividend—debilitating budget cuts, dangerously slashed human intelligence capabilities, and even debate about the necessity of the US Intelligence Community, the most expensive intelligence enterprise on the planet.

In the decade after 9/11, the IC has demonstrated the centrality of intelligence to policy, but that position may not be secure as the memory of 9/11 fades and as we enter an era of belt tightening. The new reality that the US foreign policy establishment, and by extension the IC, faces is spelled out in a thought-provoking book by Michael Mandelbaum in which he warns that because of domestic obligations this country faces, particularly caring for the ever increasing ranks of its older citizens, "The defining fact of foreign policy in the second decade of the 21st century and beyond will be 'less.'"[4] Thus, we are living in an era that none of us has ever experienced because, unlike most countries, our economic constraints have not affected US foreign policy decision-making for the past seven decades.

How do we encourage deeper policymaker literacy about the IC?

Informed Policymakers

How do we encourage deeper policymaker literacy about the IC? Brookings Institution in 2009 published a thoughtful study by Ken Lieberthal—a former special assistant to a president, senior director on the NSC, and a long-time student of intelligence—analyzing the strengths and shortcomings of the IC in the wake of the 2004–2005 intelligence reforms that provides some clues. Liberthal reported from his interviews with then active and former policymakers and intelligence professionals that most policymakers are undereducated in the use of intelligence and have no systematic understanding of the IC or of the products they receive from the IC. Moreover, he contended that most policymakers are ill equipped to ask the right questions and therefore ask for briefings on topics that often elicit "a relatively standard bureaucratic process that pulls together pertinent information and lays it out without serious attention being given to priorities, underlying uncertainties, and real insights."[5]

Such products, the author argued, are useful to a policymaker needing to get up to speed on a topic, but they tend not to force IC analysts to think through the implications of their data, debate the relative significance of different facts, and make explicit their levels of confidence in the responses they produce. *In short, because our consumers are not well schooled in what we can provide, we often fall short of helping them make deeply informed policy recommendations to the president and his Cabinet.*

What can be done to create intelligence-literate policy customers? First, we need to understand that educating the customer is an extremely difficult task that we have never done well. We have avoided tackling the issue because it can seem condescending and can lead to charges of attempts to politicize the relationship. Beginning with the legendary Sherman Kent, we have analyzed exhaustively every aspect of the IC side of the relationship with the policymaker, and we have set up high firewalls not to be crossed between the policymaker and the IC producers.[6] We have as a result, after each perceived intelligence failure, studied carefully what the IC did that led to that intelligence mistake and then carefully schooled our officers to

I believe some of our problems only can be ameliorated by radically revising our interaction with new administrations from the moment that presidential candidates are selected.

help them discern what constitutes success and failure in intelligence analysis.

But I am unaware of any effort to systematically study the policymaker's role in either intelligence successes or intelligence debacles. Most often, if policies work out, policymakers will assume that it was their hard work that made the difference and, unfortunately, if there is a policy debacle there is a strong tendency to blame the community.

We know what we could have done better on the Iraq WMD issue because we have written excellent studies of our shortcomings, and we have appropriately implemented systematic changes to our analytic tradecraft. *I am, however, unable to find any parallel effort, either within government or in academia, to systematically educate current and future policymakers to maximize the utility of intelligence* and to ask the right questions to avoid policy failures because of inadequately tapping of the capabilities of the IC. James Steinberg, currently deputy secretary of state, lamented this lack of attention to the issue in 2008 saying, "Given the enormous consequences of the evident breakdown apparent both in the September 11 and Iraq events, it is vital that practitioners on both sides try to understand the challenges inherent in the policy-intelligence interaction and how to overcome the gulf and suspicion that haunts this critical relationship."[7]

Designing a New Relationship with the White House

I believe some of our problems only can be ameliorated by radically revising our interaction with new administrations from the moment that presidential candidates are selected by their political parties and are given their first national security briefing. This is the point at which the relationship with the next president and his core national security team—in effect, his national security players in waiting—forms and needs to be shaped with briefings not only on top national security concerns, but on how we would propose to help the team prepare to use intelligence more efficiently and effectively than any past administration through a deliberate and thoughtful education process.

Obviously, this new process of education is far more complex than what I just outlined and so let me present some of the foundational work that needs to be done in advance of such an opportunity. Now in our third year of the Obama administration and with a new Congress, we have new faces involved in security policy. If the past is any indicator, too many of these new officials will have come into office, eagerly been read into their top secret codeword clearances, and started reading daily intelligence with only the most superficial understanding of what it is they are reading. Many will immediately be disappointed because they had convinced themselves that, once they got their clearances, they would see the "real secrets." If they are lucky enough to have a personal briefer, this will help but too often the briefers themselves are young and only steeped in the intelligence analysis side of this question.

Creating Intelligence Connoisseurs

What is required is the equivalent of the course now taught for analysts on the art of intelligence analysis, but this would

[6] For an example, see the incisive article written by CIA analyst Jack Davis on the history of the debates over how to serve the policymaker, "The Kent-Kendall Debate of 1949," in *Studies in Intelligence* 1992, Issue 5.

[7] James B. Steinberg, "The Policymaker's Perspective: Transparency and Partnership" in George and Bruce, *Analyzing Intelligence*, 83.

be for policymakers and members of Congress—let's call it, *Applied Intelligence for the Savvy Policymaker.* With today's technology we are capable of deploying such a course in various appealing media formats to include interactive online presentations. This course would not just be given by intelligence professionals but co-taught with former policymakers willing to share the lessons they have learned in working with the IC. Ideally, new policymakers in the future would want to take this course because it would be known to provide them a sophisticated understanding of the IC under the ODNI. Demand for the course would be high if it were known that the president and his cabinet had endorsed it.

Any attempt to design this course for new policymakers and members of Congress that in exclusively done in-house is vulnerable to charges of IC attempts at propaganda and proselytizing. Also, we have simply not developed a deep enough understanding of the topic ourselves to provide a rich and systematic briefing at this point. Thus, the director of national intelligence should ask prominent former officials from both major parties to lead a task force to develop such a course. Former officials such as Congressman Lee Hamilton, Deputy Secretary of Defense John Hamre and National Security Advisor Steve Hadley,

To provide the intellectual rigor needed to undergird a course for new policymakers and Congress, the DNI also should seek out a partnership with prominent think tanks and relevant academic institutions.

Director of National Intelligence John Negroponte, Deputy Secretary of State Thomas Pickering, US Trade Representative Charlene Barshevsky, Chairman of the Joint Chiefs of Staff Peter Pace, DCIA Michael Hayden, DCI George Tenet, and Acting DCI John McLaughlin spring to mind but there are, of course, many others with the requisite expertise.

Partnering with the Private Sector

To provide the intellectual rigor needed to undergird a course for new policymakers and Congress, the DNI also should seek out a partnership with prominent think tanks and relevant academic institutions that span the political spectrum to design case study materials from past policy successes and failures analyzing how policymakers either got the best or inadequate support from the IC.

This process would require extensive interviews with those who were intimately involved in the intelligence support and policymaking during the period studied. Such an effort would be open to suspicion if it was done in house and the academics would need access to the classified record. *To avoid rancor, the case studies might avoid recent politically charged controversies such as the issue of intelligence support to decision making on Iraq WMD but could be just as useful if done on such issues as IC support to policymakers on the Soviet Union or intelligence support during the Kosovo conflict.*[8]

Once case studies are drafted, it would be in the best interest of the IC to present them to a conference of academics and policymakers, current and former, at a symposium for a reality check and fine-tuning. Such a symposium might be appropriately convened at one of the presidential libraries and perhaps carried on CSPAN television, providing the added benefit of educating the general public on this new initiative.

Net Gens and Unauthorized Disclosures

One final important aspect of this tutorial would be a frank discussion of the damage

[8] IC assessment of the Soviet Union is attractive as a topic because it has already been extensively studied from the IC side. For example, see Douglas J. MacEachin, *CIA Assessments of the Soviet Union: The Record Versus the Charges*, (Washington, DC: Center for the Study of Intelligence, CIA, 1996).

The general public's understanding of the IC and its mission and capabilities is equally worrisome.

caused by unauthorized public disclosure. We should take heed of the implications of the recent arrest and arraignment of the 22-year-old member of the US military on charges of unauthorized disclosure of the classified information revealed through Wikileaks. He is a member of Net Gen, the generation of children, teens, and young adults aged 11 to 31 who have grown up immersed in digital technology. He allegedly downloaded a staggering 260,000 documents because he hoped their release would lead to a "worldwide discussion, debate, and reform" of the tactics in the war on terror.[9] The younger generation, whether policymakers or members of the IC, come into government with much more opens view of information and information sharing and need help understanding our unique issues.[10] Thus, the course should include a discussion of the enormous damage to US security and the financial costs to the American taxpayer when unauthorized disclosures result in damage to sensitive intelligence collection capabilities. To be effective, such a course should be open with policymakers and members of Congress in discussing the specific, recent examples of unauthorized leaks and the damage they have inflicted.

An Informed Public

The general public's understanding of the IC and its mission and capabilities is equally worrisome. All of us have experienced the uneasy feeling as we watched our profession personified by Hollywood as either the omnipotent Jack Bauer or the bumbling Maxwell Smart. At times we are portrayed as flagrantly violating the US Constitution and abusing the human rights of US citizens and foreigners alike. At other times, we are portrayed as laughingly incompetent or, worse yet, creating wars and crises because we act in secret without oversight. Few and far between are the accurate portrayals of the critical mission of the IC as the "Silent Service," going where others cannot go, risking our lives to protect Americans from harm, and providing the needed raw and finished intelligence products to inform and elevate policy deliberations.

Middling Public Approval Ratings

It is therefore not surprising that public opinion polling consistently shows that elements of the IC typically glean only about a 50-percent approval rating from the general public. This contrasts starkly with the various armed services and the FBI, which routinely poll at least 15 percentage points higher than the CIA in public opinion surveys.[11] Surveys do not even try to measure the public approval for the ODNI since there is very little public recognition of the name and almost no general understanding of its role. In the aftermath of 9/11, it seems counterintuitive and surprising that we have gained little in public approval ratings despite our large role in the battle with terrorists and the fact that intelligence has played a vital role in making sure that another 9/11 has not happened. Many IC officials have pointed to the large number of excellent resumes received each year by the IC to demonstrate that our public image is strong, but this indicator may say as much about the state of the job market and the glamorized Hollywood vision of the IC as it says about public attitudes.

Why does our public image pale in comparison to that of the armed services? To be fair, a part of our problem is simply

[9] Kevin Poulsen, Kim Zetter, "I can't believe what I am confession to you: The Wikileaks Chats," *Wired Magazine online*, 6 June 2010.

[10] For an excellent study of the challenges we face in the information age see *Where Tomorrow Will Take Us: The New Environment for Intelligence,* (Washington, *DC:* Center for the Study of Intelligence, CIA, 2010).

[11] See for example, "Distrust, Discontent, Anger and Partisan Rancor: The People and Their Government," Pew Research Center for the People and the Press http://people-press.org/2010/04/18/distrust-discontent-anger-and-partisan-rancor/ (accessed 9 May 2011).

Part of the problem is that we have not worked hard enough at strategic communications with the general public.

that we must operate under the cloak of secrecy and are therefore perceived as a bad fit for an open democracy. As Secretary of Defense Robert Gates recently put it when speaking about the CIA, "The truth is, across the political spectrum, it has had relatively few supporters other than presidents who find they like its clandestine powers. It's just an itch in our system that's hard to scratch."[12] *Secretary Gates may be a bit too fatalistic about our lot, and I believe it is this kind of presumption that holds us back from exploring new ways to convince Americans that we are not an anomaly but a necessity in American democracy.* To me, part of the problem is again that we have not worked hard enough at strategic communications with the general public. Too often, we allow others to define us (mostly negatively) by making it sound as if the sum total of our role can be summarized by referring to such controversies as Abu Ghraib and water boarding.

Reengineering Our Public Profile

Although some argue that the IC by its very nature should not have a public profile, that philosophy may be outdated in the age of new social media**.** *Frankly speaking, we only need to look at the outmoded design of www.dni.gov website in comparison to the websites of the Department of Defense or even the Defense Intelligence Agency to see that we are not communicating as well as we could with the public. Here are a few other ideas on developing stronger public insight into the IC:*

- *Internet Chats with IC experts.* Many executive branch agencies, including the White House, offer the public the opportunity for periodic on-line chats with administration officials on topics of wide interest. This is also being done with regularity by major academic think tanks. There is no reason that the ODNI and other IC leaders could not do the same under carefully controlled circumstances. National intelligence officers (NIOs) and other top-notch experts could provide on-line chat opportunities on important topics of the day to the general public. For example, the NIO for South Asia might field questions from the public on the implications of the floods in Pakistan or the NIOs for economics and East Asia might discuss the implications of China's recent emergence as the world's second largest economy. On-line chatting of this sort allows for the public to submit questions in advance so that they can be screened for any politically sensitive or inappropriate questions.

- *Outreach to Local Officials and Emerging Leaders.* It is striking when meeting with officials at the state and city level around this nation how little contact most have with the IC, beyond the FBI. Similarly, most politicians only have an association with the IC if they serve in Washington. Although there is a natural IC reluctance to hold town-hall meetings with the general public on intelligence, by invitation seminars for local officials and emerging politicians would expose them to our issues long before they became Washington policymakers. This kind of seminar is a proven formula that IC elements have used for recruiting sessions with students at universities and colleges.

- *An Official Guidebook to Intelligence***.** The CIA *World Factbook* is a wonderful resource to the general public that is heavily used on line. Although the DNI publishes the "A Consumer's Guide" to intelligence, the document is primarily intended for senior intelligence consumers in the US government and is not particularly user friendly for the general public. Creation of a general guidebook might be best accomplished by commissioning a prominent, profes-

[12] David Ignatius, "Gates: The Pentagon's Accountability Cop," *The Washington Post*, 9 September 2010.

There is one major aspect of intelligence policy that needs a clear rethinking…the bright line we have drawn over the years between intelligence and policy.

sional writer outside of the IC to write an unclassified guide that captures more fully what the uninitiated would want to know.[13]

- *Greater Publicity to Our Role in Supporting the Military.* Part of the public's high respect for the armed forces comes from their long traditions of service to the nation. Most Americans can hum the tune of the Marine Corps Hymn. The tradition of intelligence support to the military began with General George Washington, but the public perception is that the IC is only about 60 years old. While I am not suggesting uniforms and salutes, I am suggesting that we look harder at those things we might do to make ourselves more associated with proven, military traditions. One such effort is a recent *Studies* special edition, *CIA at War,* which commemorates the work of CIA men and women in conflict zones around the world since the Agency's creation.

Perceived Intelligence Failures Are Inevitable

A final reason I would cite on why strategic communications to the public is important going forward is this simple fact —there will be successful terror strikes on US soil in our future, and they may even involve the use of weapons of mass destruction. *We need only look at the major outcry against the IC that occurred after the failed terrorist attempt to blow up a commercial airliner last December to see a glimpse of the kind of blame game that is likely to engulf the IC when the next successful foreign terrorist attack occurs.* As two prominent British observers of our profession sagely put it, "Intelligence failure is a matter of expectations, and seeking to adjust expectation of what intelligence can and cannot do is surely essential to informed democratic debate. Yet if and when a catastrophic terrorist attack succeeds, public confidence in the intelligence and security services will inevitably be tested."[14] We cannot afford to wait passively for that test to come before we try to shape public expectations and understanding of what we do.

Confronting a Taboo

As we begin a new century there is one major aspect of intelligence policy that needs a clear rethinking in consultation with the Executive Branch and the US Congress. This is the bright line we have drawn over the years between intelligence and policy. Sherman Kent was adamant in his belief that intelligence analysis is a service arm to policymakers and that it should not be a formulator of objectives, a drafter of policy, or a maker of plans. But increasingly today, policymakers and legislators find that the intelligence analysts' adherence to this article of faith robs the policymaker of the ideas and suggestions for policy that a highly informed analyst can provide. They often complain that briefings that provide just the facts are simply not relevant and helpful enough. They can get the facts off of the Internet at a greater speed than we can deliver them, but what they crave from us is analytic insight and our thoughts on how US foreign policy can be advanced.

I believe former DNI Dennis Blair took a large step toward toning down the bright line when in a media roundtable in March 2009 he told the press that he had mandated that every piece of analysis on important issues not only have a threat analysis section but also an opportunities analysis section. He described opportunity analysis as helping policymakers "find the levers…which will enable us to advance our interests and our common interests."[15] Despite his pronouncement, opportunities analysis remains uncomfortable and controversial in many IC

[13] The DNI guide is located at http://www.dni.gov/reports/IC_Consumers_Guide_2009.pdf.

[14] Len Scott and R. Gerald Hughes, "Intelligence in the 21st Century," *Intelligence and Security* 24, No. 1 (February 2009), 24.

components. Analytic managers are far too concerned that providing some suggestion on policy options will taint analysis and destroy its purity. Yet in most of the advanced intelligence services around the globe no such bright line is drawn. And, I would argue, this bright line robs the policymaker of some of the most useful byproducts of analytic depth and sophistication.

We have consistently not prepared our customers to use intelligence wisely, and thus we are afraid of what they will do with even guarded policy inputs. Were we better at in-depth communication with our customers, we could jointly set parameters on opportunity analysis that would protect the IC from accusations of politicization or meddling in policy. In this regard, I am reminded of Secretary of State Colin Powell's famous adage that demonstrates his sophisticated understanding of the role of intelligence:

> *I will hold you* [the intelligence expert] *accountable for what you tell me is a fact; and I will hold you accountable for what you tell me is not going to happen because you have the fact on that, or you don't know what's going to happen, or you know what your body of ignorance is and you told me what that is. Now when you tell me what's most likely to happen, then I, as the policymaker, have to make a judgment as to whether I act on that, and I won't hold you accountable for it because that is a judgment; and judgments of this kind are made by policymakers, not by intelligence experts.*[16]

I recognize that many will argue that, if we cross the divide, we will lose our analytic objectivity and integrity. I think that this was more of a problem when we were just beginning after World War II to create the craft of intelligence analysis. That craft is now well developed, and we have a keen sense of how to keep our integrity**.** *My worry is that, if we continue to defend a rigid line of detachment from policy, we will lose our reason for existence—the opportunity to elevate the policy debate.* Policymakers have often stated that, when the IC becomes a part of a policy-intelligence task force working a particular problem, the intelligence provided becomes much better targeted to assist the policymaker. This is in part because, when we stay outside the policy circles, we have less understanding of what is really needed. Whereas when we are in the circle, we are better able to target our resources and analysis to the exacting needs of the moment.

My worry is that, if we continue to defend a rigid line of detachment from policy, we will lose our reason for existence—the opportunity to elevate the policy debate.

This brings me to my final recommendation and that is the need for a *Center for the Study of the Intelligence Innovation administered by the ODNI.* As noted above, we can do a great deal by reaching out to former officials, the academic community and think tanks for help on educating our consumers. But ultimately we should have a permanent staff of professionals who study this centrally important question on a continuing basis. The Center for the Study of Intelligence (CSI) at CIA provides a good model for this activity and is adapting to widen its focus beyond CIA. CSI recently has begun assuming the IC's Lessons Learned and history functions and is thus taking a greater community role. Policymaker needs are dynamic and change quickly because of the flow of world events and rapid technological advances. If we are to remain relevant, we cannot neglect serious study of the policy-intelligence interface.

The Pursuit of Intelligence History: Methods, Sources, and Trajectories in the United Kingdom

Christopher R. Moran

This article is an overview of the history of the academic study of intelligence in the United Kingdom since 1945, a time marked by three distinctive periods of historiography. Each, labelled here as Absence, Emergence, and Efflorescence, has contained unique themes and approaches to intelligence history as it has been practiced in Britain.[a]

> ***"Clarity has come to intelligence history much like the restoration of an aged fresco."***

Clarity has come to intelligence history much like the restoration of an aged fresco in which hidden details are gradually revealed through repeated cleansings until a full-bodied picture emerges. Attempts to establish the history of British intelligence have ranged greatly in style and quality, from the lurid works served up by the media and by the purveyors of conspiracy theory (appropriately described by Nicholas Hiley as "lightweight meals that sit so heavily on the stomach"),[1] *to the tomes, written by official historians and born of patient work in archives and historical scholarship.*

Writers on intelligence have been a fissiparous bunch, their focus and approach shaped to a large extent by forces and events in the real world. In the 1960s and 1970s, as public fascination with and fear about espionage grew exponentially following a string of high-profile fiascoes (including the U-2 spy plane incident in May 1960, the abortive Bay of Pigs invasion in April 1961, the John Vassall spy case in 1962, and the Profumo Affair in 1963), many authors made their names by looking at scandal.

For the likes of Andrew Boyle— whose book The Climate of Treason: Five who Spied for Russia *led to the public unmasking in 1979 of Anthony Blunt as a former Soviet agent—writing intelligence history was both a professional and a political activity, designed to shake the Establishment by shining a harsh and bright light on its unethical*

All statements of fact, opinion, or analysis expressed in this article are those of the author. Nothing in the article should be construed as asserting or implying US government endorsement of its factual statements and interpretations.

Secret service work was wreathed in a miasma of secrecy; its practitioners were spectral figures, known only to their exclusive fraternal initiates.

practices.[2] *In the mid- to late 1970s and then into the 1980s, as governments lifted the lid on Allied codebreaking successes during the Second World War, so historians paid much closer attention to the role of intelligence. Similarly, in the 1990s, as the British intelligence services themselves began to edge toward the light—they were first listed in the statute books, for example, and began declassifying hitherto secret records—so the nascent discipline of intelligence studies entrenched itself in academia.*

In the 21st century, the history of Britain's intelligence services has enjoyed a revival in the wake of the terrorist attacks of 9/11, Madrid, and London, as well as the conflicts in Iraq and Afghanistan. Thanks to the spooks of today, the spies of the past are no longer the supporting cast in some larger drama of international relations but are front and center on the historical stage.

Intelligence history, while presently booming, is fast approaching another tipping point. With the official histories of the Security Service (MI5), the Secret Intelligence Service (SIS/MI6) and the Joint Intelligence Committee (JIC) hitting bookshops in 2009, 2010, and 2013 respectively, much of the original fresco will have been restored. For the intelligence historian, therefore, plotting the future of the past has never been more important.

Absence

For a long time, intelligence history was the Cinderella of disciplines of history, starved of recognition and marginalized by its more successful scholarly sisters. In 1984, Christopher Andrew and David Dilks famously described intelligence as the "missing dimension" in historical inquiry, conspicuous in its absence from the literature of both modern government and international relations.[3] Filling this significant lacuna was a task for which few serious historians had the stomach. Throughout much of the 20th century, the UK intelligence community was the "invisible man" of government, a state within a state, and an entity about which questions were never asked, even in Parliament.

Secret service work was wreathed in a miasma of secrecy; its practitioners—like members of a collegiate society—were spectral figures, known only to their exclusive fraternal initiates. "It is the essence of a Secret Service," declared Sir Austen Chamberlain (then foreign secretary) in December 1924, "that it must be secret, and if you once begin disclosure it is perfectly obvious to me as to honorable members opposite that there is no longer any Secret Service and that you must do without it."[4]

Governments, irrespective of their political persuasion, refused to avow the very existence of the intelligence agencies. As Sir Frank Newsam (then Home Office permanent undersecretary) wrote in October 1952: "I was brought up in the tradition that the existence of the Security Service should never be mentioned save in the highest circles, and, for a very long time, I never knew its address and have only recently entered its portals."[5] It was often said that the British attitude toward intelligence mirrored societal attitudes toward marital sex; that is, everyone knew that it went on, but to "speak, write or ask questions about it" was not done.[6]

Much to the chagrin of independent historians, the taboo of secrecy surrounding intelligence was undergirded by the indefinite closure of service records. No matter how old or how sensitive, all documents that referred to intelligence found themselves in a historical never-never land, withheld indefinitely from release to the Public Record Office (PRO), now The National Archives (TNA).[7] Section 3 (4) of the Public Records Act (1958, 1967), otherwise known as the "blanket" exemption, gave the

With historians deprived of documents and governments determined to choke off public debate, the "history" of Britain's intelligence services was written largely by investigative journalists and "exposé merchants."

lord chancellor discretionary power to hold back any file related to intelligence or the intelligence services. In 1982, the Wilson Committee on Modern Public Records highlighted absurd examples of closed material, including postal intercept files from the 18th century and intelligence bulletins from the Battle of Waterloo. The dearth of primary source material discouraged even the most intrepid historian, to whom accessible documentation was the lifeblood of good scholarship.

Keeping the intelligence services walled off from public view was generally defended on the grounds of operational security. The agencies claimed, with some justification, that intelligence gathering would be jeopardized if its sources or methods were disclosed. In the field of human intelligence (HUMINT), for example, the identification of an individual as a secret agent is very often a matter of life or death.

Indeed, since the danger of retribution against a spy is not necessarily restricted to a single generation, one should not assume that the passage of time concurrently diminishes the hazards of disclosure. Without a promise of absolute secrecy, moreover, it was feared that agent recruitment would diminish and service morale plummet. "Secrecy is the breath of life to the clandestine warrior," intoned RAdm. A. H. Taylor in June 1945: "It is necessary for his own morale as well as for his security that he should know it will be faithfully observed."[8]

Whitehall's commitment to keeping intelligence matters secret was so unyielding that officials often went to remarkable lengths to prevent disclosures from occurring. Nothing illustrates this better than the *Spycatcher* affair of 1986–88, when then Prime Minister Margaret Thatcher tried unsuccessfully to suppress the memoir of Peter Wright, an embittered former assistant director of MI5. Ghost written by Paul Greengrass (who would later direct the Jason Bourne films), *Spycatcher* alleged that the late Sir Roger Hollis, a past director general of the service, had been a Soviet mole, and it accused MI5 of plotting against, snooping on, and defaming then Prime Minister Harold Wilson in the mid-1970s.[9]

Wright's allegations were neither novel nor discernibly damaging to national security. In March 1981, Fleet Street's greatest scoop-merchant, Chapman Pincher, published *Their Trade is Treachery*, which forced Thatcher to admit in Parliament that Hollis had been investigated some years earlier as a possible Russian spy.[10] Unlike Pincher, however, Wright was an insider who had taken a lifelong oath of silence and whose account was less easily "deniable." In 1987, therefore, Her Majesty's Government (HMG) banned *Spycatcher* in the UK, prohibited newspaper reportage with a series of gag orders, and sought a court injunction to halt the book's publication in Australia.

The insistence on a blanket ban was ludicrous. *Spycatcher* had already been published in the United States and ranked first on *The New York Times* best sellers list; thousands of copies had crossed the Atlantic and were washing up in second-hand bookstores.[11] The affair descended into complete farce when Cabinet Secretary Sir Robert Armstrong was dispatched to an Australian court to present the government's case.

Famously, Armstrong endured a torrid time, harried by a brash young advocate and ridiculed by the world's media for refusing to accept that SIS existed. Armstrong's credibility was fatally undermined when, under cross-examination, he was forced to concede, in a priceless admission, that he had been "economical with the truth." Since open sales of *Spy-*

catcher overseas had rendered moot the question of secrecy, attempts to squelch publication ultimately failed and brought mockery upon intelligence taboos.

With historians deprived of documents and governments determined to choke off public debate, the "history" of Britain's intelligence services was written largely by investigative journalists and "exposé merchants," relying on inside information obtained from well-connected friends in Whitehall. With an impish pleasure in wreaking havoc, authors such as Pincher, Nigel West, and Andrew Boyle focused on subjects perfectly calculated to rile the Establishment, including the Wilson Plot, the Cambridge Five, and the purported duplicity of Roger Hollis. (Now in his nineties, Pincher remains convinced that Hollis was a Soviet agent.)[12]

Sometimes referred to pejoratively as the "airport bookstall" school of intelligence historiography,[13] this genre of spy literature first came to prominence in the 1960s, a period known as the "era of exposure" for the intelligence and security agencies.[14] In the United States, the CIA's ill-fated attempt to overthrow Cuban dictator Fidel Castro at the Bay of Pigs made front-page news, as did the shoot-downs of the U-2 and the RB-47 in 1960. Later in the decade, as the public became increasingly disillusioned with the war in Vietnam, and as stories emerged that US-sponsored covert action was propping up corrupt regimes in Central and South America, the CIA was seen in certain quarters as symbolic of a nation losing its way.

In Britain, the early 1960s were punctuated by a series of real-life spy scandals, beginning with the exposure of George Blake as a Soviet spy in 1961 and culminating with the revelation in 1963 that the secretary of state for war, John Profumo, had shared his prostitute girlfriend, Christine Keeler, with a Russian spymaster. By the late 1960s, things got worse. In 1967, the *Daily Express* revealed that the Government Communications Headquarters (GCHQ) routinely intercepted thousands of private cables, setting in motion a chain of events that brought personal obloquy upon Harold Wilson and very nearly spelled the end for the D-Notice Committee, the joint government/media body whose purpose was to prevent the public disclosure of information that would adversely affect the defense of the realm. A year later, Kim Philby, the ruthless SIS traitor and "Third Man" who had defected to the Soviet Union in January 1963, published his KGB-blessed memoir, *My Silent War*, which remorselessly revealed the details of SIS personnel and relationships and his own role as a Russian spy for over 30 years.

Philby and his band of turncoats became a "magnetic specter"[15] to a generation of sensation-seeking writers. Just about every "airport bookstall"

In the UK, the emergence of intelligence was more specifically linked to a series of accessibly written, authoritative, and revealing histories of wartime deception published by respected intelligence veterans in the early 1970s.

author with basic literary ability—and some without—tried to make a quick buck by peddling tall tales of treachery, betrayal, murder, and whatnot. In pursuit of the "Fourth Man" (eventually revealed as Anthony Blunt), accounts tended to focus on the cloistered quadrangles of Cambridge in the 1930s and on the secret societies, such as the Apostles, that became Marxist cells for the disaffected moneyed elite. The spate of books that were produced on Philby were in the main deeply critical of the spy, suggesting that he had handed over thousands of state secrets and caused hundreds of deaths.

In what many regard as an unforgivable apologia that may have cost him a knighthood and a Nobel Prize, the novelist Graham Greene was a lone voice in depicting Philby as a misunderstood idealist, or "passionate pilgrim," who sacrificed everything for the cause of the oppressed proletariat.[16] Greene—a close friend of Philby, following Greene's time in SIS during the Second World War—compared the spy to a persecuted Catholic in Elizabethan England.

By many accounts, the real sin of the Cambridge Five was not betraying their country, but betraying their class.[17] The motivation for disclosure was to expose the Establishment for being so blinded by class prejudice that it failed to spot treachery within its ranks. Toffs to a man, Guy Burgess, Donald Maclean, Philby, Blunt and John Cairncross had all advanced because they had attended the right schools and the right gentlemen's clubs. Similarly, many accounts of the Profumo Affair were not espionage yarns per se, but commentaries on Britain's moral landscape, critiquing those who had become sexually liberated and Bohemian long before it was fashionable.

By the late 1970s, the spread of "mole mania," coupled with the felicitous cresting of the James Bond phenomenon, arguably had created an unquenchable public thirst for sensational tales of espionage, a trend that continues today. As Oliver Hoare argues, "Racy histories of secret services…have often been the norm."[18] In academic circles, "airport bookstall" accounts were frequently met with ridicule or outright hostility, and served only to devalue the credibility of intelligence as a respectable field of inquiry. In the years to come, it is possible scholars will rehabilitate the "airport bookstall" school as a form of "protohistory" which, despite its flaws, facilitated the public emergence of Britain's intelligence agencies and the writings of the first professional intelligence historians.

Emergence

By the late 1980s, intelligence history had started to come of age, demonstrating how attention to the form and function of espionage could challenge existing orthodoxies about international relations and modern governance. Its ascent was in part the corollary of seismic events in the United States. In 1975, the Senate's famous Church Committee hearings exposed some of the CIA's most dubious, if not outright illegal activities, including the surveillance of domestic dissidents and the covert subversion of foreign governments. Church's festival of revelation was transformative for the US intelligence community and "provided scholars, in the Western world, at least, with hitherto absent incentives and reasons to study intelligence."[19]

Revealing World War II History

In the UK, the emergence of intelligence was more specifically linked to a series of accessibly written, authoritative, and revealing histories of wartime deception published by respected intelligence veterans in the early 1970s. In 1972, the

Published after 1945, the official histories of the Second World War were carefully doctored to maintain state security and thus contained no mention of Bletchley Park.

Oxford don, John Masterman, published *The Double-Cross System in the War of 1939–45*, an account of the highly successful XX Committee and its turning of German spies into double agents during World War II.[20] With outstanding social connections (then Prime Minister Edward Heath was a former student), Masterman was persona grata to members of the Establishment who shared the author's desire to champion the achievements of the system and to head off erroneous "outsider" histories.

Two years later, Group Captain Frederick Winterbotham, a former intelligence officer at the Government Code and Cypher School at Bletchley Park, was allowed to publish the first English-language work dedicated to the Ultra secret—"the greatest secret of World War Two after the atom bomb"[21]—and the influence of Enigma decryption on the course of the war.[22] Although hagiographic and unreliable in places (Winterbotham was accused of lacking "the most elementary technical knowledge" of cryptography, as well as downgrading the Polish and French contributions in breaking German ciphers),[23] *The Ultra Secret* represented a significant milestone in the pursuit of intelligence history. Ultra ranked as one of the best-kept secrets of all time. In July 1945, amid concerns that its revelation might preclude postwar rapprochement with Germany (whose leaders might claim that they were not "well and fairly beaten," à la 1918), the JIC had considered it "imperative that the fact that such intelligence was available should NEVER be disclosed."[24]

Published after 1945, the official histories of the Second World War were carefully doctored to maintain state security and thus contained no mention of Bletchley Park. Despite his reputation as something of a loose cannon, a man wanting in constraint and fickle in his loyalties to the rules of censorship, Winston Churchill was silent on the subject in his multivolume memoir of the conflict. As David Reynolds argues, for such a great aficionado of Signals Intelligence (SIGINT), Churchill made a "considerable sacrifice," a point not lost on Bletchley Park veterans who, should their wartime prime minister have spilled the beans, may have followed suit.[25]

Winterbotham's account opened up a brand new chapter in the public's understanding of WW II and provoked a groundswell of academic interest in the role of intelligence, counterintelligence, and deception. Knowing the Allies had been in possession of event-influencing information, military historians who had been enamored of a particular general or admiral lost faith, igniting a firestorm of historical revisionism.

Opening Archives

With the Ultra secret in the public domain, Whitehall, perhaps unexpectedly, began to reassess its approach to intelligence archives. Although spread over many years so "as to generate the minimum public interest,"[26] from the mid-1970s HMG started to declassify its Great War SIGINT record, the Room 40 O.B. archive. In 1977, the first batch of Enigma decrypts and other Ultra-related material was released to the National Archives. Two years later, ministers took a bolder step in authorizing the publication of the first volume of Professor Sir Harry Hinsley's official history, *British Intelligence in the Second World War*, researched and written with the help of several able hands who, like Hinsley, had served at Bletchley Park during the war.[27]

The brainchild of former Cabinet Secretary Sir Burke Trend, Hinsley's multivolume tome had been conceived as a "counterblast" against the deluge of salacious outsider accounts.[28] Depending upon who was spinning the tale, British intelligence was increasingly seen as a safe haven for disillusioned toffs more accustomed to dis-

gorging secrets to the enemy than defending the realm. In his widely read "Karla Trilogy" (1974–79), for example, John le Carré explored a world of betrayal, treason, and murder, peopled by those who become what they behold. Fair but forthright, unfailingly well written, and meticulously researched (Hinsley and his team had been granted unrestricted access to official papers), *British Intelligence in the Second World War* won wide-ranging praise from academia's most knowledgeable and discerning commentators. CIA officer-turned-scholar Walter Pforzheimer called it "the single greatest work on intelligence ever produced," and it set the benchmark by which all other works on the subject are judged.[29]

Hacking into Other Sources

Hinsley's history firmly contested the para-historian's attempt to annex intelligence to the domain of "airport bookstall" literature and piqued the curiosity of an emerging generation of professional researchers. In the 1980s and early 1990s, scholars became less inclined to scoff and increasingly skilled at what one scholar has termed "archival intelligence hacking."[30] Hacker in chief was Christopher Andrew, Hinsley's heir apparent, but the roll also included David Stafford, Julian Lewis and Bradley Smith. Drawing upon private papers as well as so-called "adjacent" records, such as Foreign Office and Treasury files, the aforementioned demonstrated that there was sufficient declassified material to "fill in both the general outline of the missing intelligence dimension and much of its operational detail."[31]

Private collections were particularly bountiful, as long as an author was prepared to weed through, canvass, and weight each folio of inchoate documents; statesmen of the first rank, including Winston Churchill and Anthony Eden, had routinely taken copies of confidential documents home with them—copies which, unbeknownst to the Cabinet Office, were often retained among those officials' personal papers. For example, in Eden's stockpile, formally deposited in the Birmingham University Library in 1990, was the first page of Sir Edward Bridges' Top Secret report into the disappearance of SIS frogman Lionel "Buster" Crabb (not officially declassified until 2006).

Authors with a penchant for lateral thinking also started to prize UK records out of the archives and libraries of foreign states. With its sunshine laws and landmark Freedom of Information Act, signed into law by President Lyndon B. Johnson on 4 July 1966, America was increasingly seen as an Aladdin's cave—or wonderland—where any number of

In recent years, the discipline of intelligence studies has gone from strength to strength, becoming a magnet for postgraduate students and postdoctoral researchers around the world.

jewels could be found.[32] The archive of the Office of Strategic Services (OSS), the wartime counterpart of SIS and forerunner of the CIA, was said to contain "not just isolated documents," but quite often "entire files of British material."[33] In his biography of Sir Stewart Graham Menzies ("C" during and after World War Two), the globe-trotting writer Anthony Cave Brown showed that Special Operations Executive (SOE) materials were available for public inspection in the papers of C's American equivalent, William J. Donovan, which were housed at the US Army War College in Carlisle, Pennsylvania.[34]

The desire to open up the "missing dimension" enveloped Christopher Andrew in writing what became a massively detailed history of the British intelligence services. Published in 1985 and stretching to over 700 pages, *Secret Service: The Making of the British Intelligence Community* demonstrated the value of sustained and creative archival research.[35] In 1986, Andrew cofounded *Intelligence and National Security*, the first (and now preeminent) academic journal in the field. The premise of its first issue was that intelligence represented a "proper" subject of study for scholars in political history and kindred disciplines.

Others soon shared this sentiment. As Keith Jeffrey has argued, a "conclusive indicator" of the subject's newfound legitimacy was the acceptance of articles by traditional periodical outlets.[36] In 1986, for example, both *The Journal of Contemporary History* and *The English Historical Review* published articles on intelligence for the first time.[37] The proliferation of conferences was also instrumental in ushering in a growing scholarly appreciation for espionage-related topics.

This is not to say, however, that the first generation of serious scholarship was problem-free and beyond critical self-examination. As stated by John Lewis Gaddis, the "British School of Intelligence Studies" (as it became known) lent itself to "buffism," preoccupied with a love of particular and esoteric terminology.[38] Many works—framed within the parameters of organizational theory and institutional practice—elided context and expended little effort in showing how the intelligence services made a difference. In consequence, they were beyond the ken of the average student.

Published fitfully between 1979 and 1990, the five volumes produced by Hinsley and his assistants were a monument to the triumph, but also to the inherent problems of intelli-

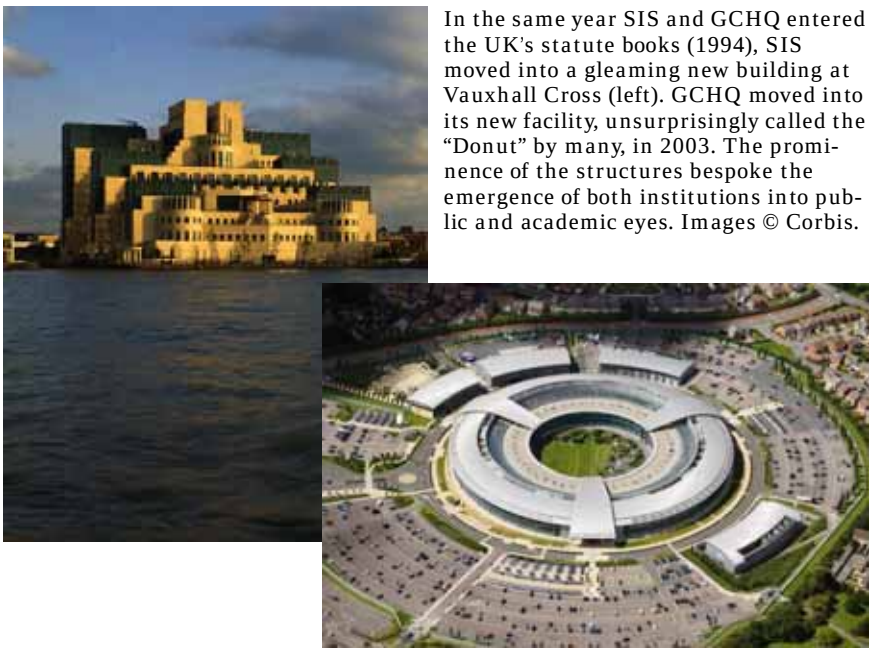
gence history in its earliest manifestation. As Ralph Erskine noted of Volume 3, "Hinsley makes too few judgements, and his book is definitely not bedside reading. Order of battle appreciations loom all too large."[39] The pursuit of intelligence history, therefore, demanded not only the centrifugal instinct to locate minutiae in the archives, but also a centripetal inclination to contextualize those details for a readership that might not be cognizant of the basic contours and outlines.

Efflorescence

In recent years, the discipline of intelligence studies has gone from strength to strength, becoming a magnet for postgraduate students and postdoctoral researchers around the world, and producing an impressive and varied literature. The steady stream of scholarship that has accrued over the past two decades has coincided with an ever-growing public awareness about intelligence. Following the high drama of 1989 and the end of the Cold War, the intelligence and security services entered a new phase in their history. As borders opened and free elections ousted communist regimes across Eastern Europe, the UK intelligence community confidently anticipated a period of relative geopolitical calm and, in turn, placed greater emphasis on accountability and transparency.

This new era of optimism and openness had a physical metonym: the Berlin Wall.[40] During the Cold War, as made famous by John le Carré's novel *The Spy Who Came in from the Cold* (1963), the Wall was the literal and symbolic epicenter of the great game of espionage; by the early 1990s it had been torn down. The lifting of the veil in the UK began in 1989, when MI5 was placed, for the first time, on a legislative footing. The Security Service Act (1989) came into being partly as a response to complaints about unauthorized government surveillance. Four years earlier, MI5 had faced a barrage of media scrutiny when a former officer, Cathy Massiter, provided evidence before the European Court of Human Rights that the service had been illegally bugging the telephones of pressure groups, such as the Campaign for Nuclear Disarmament (CND), as well as political "high fliers," including Patricia Hewitt and Harriet Harman, then leading members of the National Council for Civil Liberties.



In the same year SIS and GCHQ entered the UK's statute books (1994), SIS moved into a gleaming new building at Vauxhall Cross (left). GCHQ moved into its new facility, unsurprisingly called the "Donut" by many, in 2003. The prominence of the structures bespoke the emergence of both institutions into public and academic eyes. Images © Corbis.

In the 18 months following her appointment as director general of MI5 in December 1991, Stella Rimington became the first spy chief to be publicly named; the first to pose openly for cameras; and the first to publish a brochure, entitled *MI5: The Security Service* (1993), describing the organization's activities.[41] Perhaps even more surprisingly, on 7 May 1992, then Prime Minister John Major acknowledged in Parlia-

Since 2001, few subjects have commanded so much attention and controversy as intelligence.

ment that Sir Colin McColl was the incumbent head of SIS.[42] Hitherto, McColl and his predecessors had been ritually referred to as "C," the fabled code name that originated with Captain Sir Mansfield Cumming, the first director of the service.

In 1994, SIS and GCHQ joined the MI5 on the statute book, while the Intelligence and Security Committee (ISC) was established to oversee the "policy, administration and expenditure" of the three agencies.[43] It should be said that the British glasnost was not in isolation; the collapse of communism prompted most Central and Eastern European secret services, previously little more than Soviet surrogates, to enshrine their responsibilities and powers in statute.

Underpinning this new spirit of openness was a perception that intelligence as a whole was becoming less important. For statesmen and practitioners alike, the passing of Marxism-Leninism from the Soviet Union, the diminution of the likelihood of large-scale conflict between states, and the purported universalization of Western liberal democracy as the final form of government all pointed to a "New World Order" in which intelligence would take a backseat.

By the early 2000s, however, this belief had been shown to be naïve. The post-Cold War era had not brought an end to conflict or instability, nor had it confirmed "the end of history," in which secular free-market democracy reigned unchallenged. The intelligence services, having lost the stabilizing force of a common enemy, found themselves required to adapt to a host of new threats, from the development of corruption, cartels, and mafias in transitioning countries, to the global spread of terrorism, organized crime, drug smuggling, and human trafficking.

Terrorism and Iraq

Since 2001, few subjects have commanded so much attention and controversy as intelligence. The terrorist attacks of 9/11, Madrid, and in London, the wars in Iraq and Afghanistan, debates about weapons of mass destruction (WMD), domestic surveillance, and secret detention and rendition have all brought unwelcome notoriety and exposure to the intelligence services. In a world of media plenty, the importance, but also the limitations and abuses of intelligence, have never been more visible. In the face of threats from militant jihadists, public expectations of intelligence have soared to an all-time high, as have calls for greater transparency about what is being done to combat this menace.[44]

The British government has played an instrumental, if not always positive, role in dragging its intelligence community into the sunlight. In the summer of 2003, members of the administration of then Prime Minister Tony Blair, in particular Downing Street's then Director of Communications and Strategy Alastair Campbell, came under heavy fire amid allegations that intelligence on Iraqi WMD had been deliberately twisted—or "sexed up"—in its representation to the public in order to present an exaggerated case for military action. The row centered on the publication of two highly contentious dossiers, which, using intelligence-derived information (including both HUMINT gathered by SIS and—for the first time—JIC assessments), claimed that Iraq had reconstituted its nuclear weapons program and could "deploy [chemical and biological] weapons within 45 minutes of a decision to do so."[45]

Asking the JIC to produce material for public consumption was an act without parallel in British politics. Blair, writes Christopher Andrew, "finally laid to rest the traditional taboo that British governments do not mention their intelligence services."[46] As the months passed without any sign of the weapons about

which Blair and his security apparatchiks had ominously warned, breaking this taboo proved disastrous. Ministers were accused of "spinning" intelligence to sell the war on a false premise, and the intelligence services, historically unswayed by the interests of any political party or class, were criticized for compromising their independence and succumbing to political influence.

As Richard Aldrich argues, "the opening up of intelligence has followed the law of unintended consequences."[47] Intending only to disclose selected snippets of information, the government instead put intelligence into a goldfish bowl, encouraging the ceaseless scrutiny of an increasingly inquisitorial Parliament and a decreasingly deferential media. Symbolizing the slide towards greater openness, the Hutton Inquiry, which reported on 28 January 2004, posted online virtually all of its evidence, including sensitive documents written only weeks before.

In a community-wide bid to restore public confidence, each intelligence service now places job advertisements in the national press, offers career presentations at academic recruitment fairs, and maintains a website delineating objectives and staffing. Generally speaking, MI5 is more open than its sister service, SIS. In a recent step towards greater transparency, on 6 January 2009 Jonathan Evans became the first serving director general in MI5's 100-year history to meet the press.

In a community-wide bid to restore public confidence, each intelligence service now places job advertisements in the national press, offers career presentations at academic recruitment fairs, and maintains a website.

New Openings

Historiography has benefited immeasurably from the two-decade waning of intelligence taboos. Declassification of documentary evidence, especially older material, has gone hand in hand with the more general opening up of intelligence agencies. The process began with the Waldegrave Initiative on Open Government in 1993, which saw the first release of historical records generated by the secret services and afforded independent historians the opportunity to assist in the formulation of retention and release policies.[48]

By the end of the second millennium, hundreds of files relating to SOE, MI5, and Ultra had been transferred to TNA, though few related to the period beyond 1945. Since then, a tsunami of declassified material has occurred. To date, MI5 has declassified approximately 4,000 "pieces" of historically significant information (in official usage, a piece may represent a whole file or a particular portion of it), including wartime material on German spies and double agents, and early Cold War files on Soviet intelligence operations.[49] SIS, despite retaining its own archive, has released a number of documents held in the files of other departments and approved the declassification of all surviving SOE records in its custody. Now, rather than retain entire documents, departments producing classified material increasingly extract or "white-out" sensitive passages (a redaction technique CIA has used since the 1970s—though it blacks out passages).

The opening of new repositories in Eastern Europe has also given historians a revealing glimpse at intelligence activities and the mindset on the other side of the Iron Curtain. Materials bearing on the work of the East German Ministry for State Security (Stasi) have revealed a web of foreign espionage in Britain during the Cold War. By referring to a vast array of German sources in his book *The Stasi Files,* Anthony Glees suggested that some 100 Britons operated—wittingly or not—as agents of influence, including prominent CND members and, most controversially, Lord Roper, former director of studies at Chatham House.[50]

It should be said, of course, that former Eastern bloc read-

In Britain, where spin doctors have a particular resonance in this field, the sincerity of declassification efforts has been the subject of much debate.

ing rooms do present problems. Although the communist system was *akribisch*—that is, obsessive about documenting itself—officials often talked "newspeak rather than brass tacks even behind closed doors." Files relating to agents and informants, moreover, are notoriously patchy.[51] In a memorably bitter review, Paul Maddrell attacked *The Stasi Files* for inflating its subject matter and accused Glees of committing a cardinal sin for any historian, failing to authenticate the reliability of his evidence.[52]

In Britain, where spin doctors have a particular resonance in this field, the sincerity of declassification efforts has been the subject of much debate. For British intelligence scholar Ken Robertson they have been tantamount to carefully coordinated publicity stunts by a government intent on "policing its past," providing officials with the opportunity to rhapsodize about transparency while it exerts control over the pace and content of disclosure. Newly released files, it is said, only disclose what governments deem safe to put on public view.[53]

Following Robertson's example, Peter Gill argues that Whitehall has become increasingly skilled at what he calls "burying," a strategy of bombarding the public with a mass of largely insignificant information.[54] The first tranche of SOE material, which included hefty batches of files on sabotage devices (e.g., incendiary cigarettes and exploding rats), and papers setting out plans to assassinate Adolf Hitler, was presented to the public as one of the biggest "windfalls" of the end of the Cold War. Such material is all well and good, auguring, as it did, a more open future. It would be well to bear in mind, however, that such programs of document release might also serve as the perfect matador's cape—waved ostentatiously to draw the eye away from more critical areas.

Richard Aldrich is another scholar who has warned against taking the Waldegrave Initiative at face value. Before entering the public domain, he reminds us, official records are meticulously "preselected, cleaned and processed" by the Whitehall machine. With no external assurance that what is released is "necessarily an analogue of reality," what is to stop the researcher from becoming an official historian, albeit once removed?[55] Documents written by actual spies require perhaps the most careful handling. As Bernard Porter writes, "all spies and secret agents are liars, trained in techniques of deception and dissimulation, who are just as likely to fake the historical record as anything else."[56]

Some researchers therefore have turned to oral history—"growing their own records"—in order to corroborate the accuracy of their archival findings.[57] This, too, of course, has inherent flaws—the inevitable diminished memory, especially when a subject worked in secrecy. Such testimony is often polluted by what has been absorbed from subsequent experience and discourse, or, in the case of the once powerful, corrupted by a self-conscious desire to entomb a good reputation. As Philip Davies convincingly argues, the most effective intelligence scholar should not use witness testimony to the exclusion of all other material but should "triangulate" research through a triad of archival, secondary, *and* oral sources.[58]

Communities of Research

Although the scope of historical writing on intelligence today is so wide that it is difficult to pigeonhole scholars into research communities or subschools, Wesley Wark's treatise *Espionage: Past, Present, Future?* notes that certain "projects" are presently being pursued and suggests a few categories.[59]

Frameworks. The first might be called the "Research Proj-

ect," the main task of which is to establish the historical framework of intelligence, rediscovering and interpreting its growth, performance, and relevance. Centered on the "episodic treatment of intelligence in peace and war" during the period from the creation of the Secret Service Bureau in 1909 to the end of the Cold War,[60] the "Research Project" involves a prolonged immersion in archival sources and favors the case study methodology. Many texts are understandably prone to narrative and description. Without such work, however, intelligence history would remain conjectural, even conspiratorial and misconceived, and laden with epistemic blind spots.

Theory. A second project works to answer the question, "What is intelligence?" The effort to define intelligence rubs shoulders with political science, gives rise to what is often referred to as "intelligence theory,"[61] and is, as Michael Warner explains, far more complicated than painting a caricature of "some shadowy figure…skulking in a dark alley." Moreover, how we define intelligence has significant implications for practitioners and scholars alike, shaping the work and remit of oversight committees, as well as influencing declassification policies by elucidating what are and are not activities that governments are required to keep secret.[62]

Until recently—in the much-quoted words of Walter Laqueur—"all attempts to develop ambitious theories of intelligence have failed."

Until recently—in the much-quoted words of Walter Laqueur—"all attempts to develop ambitious theories of intelligence have failed."[63] Officialdom stuck to a very rigid definition of intelligence as "information about things foreign"—capabilities, intentions, or activities. In academic writing, meanwhile, the term was defined de novo by each scholar who discussed it. Today we tend to think about intelligence in terms of a three-part schema.[64] The first, usually labelled "the intelligence cycle," is a series of steps that begins with a request for information, which is then collected, analyzed, and disseminated to the client. Secondly, it is seen as a "product," used by decisionmakers at several levels. Thirdly, it is seen as an "institution," encompassing the roles of related pursuits such as covert action, deception, and clandestine diplomacy.

Warner's definition—"Intelligence is secret, state activity to understand or influence foreign entities"—is as apt as it is succinct.[65] This said, in the 21st century it is arguably getting harder to build a properly encompassing taxonomy of intelligence. The increased production and consumption of surreptitiously acquired information by private groups, such as water suppliers, electricity companies, and airlines challenges the assertion that intelligence is organized by the state for the state.[66]

The recent emphasis on open source intelligence (OSINT) has further muddied the water, "blurr[ing] distinctions between intelligence and information and the barrier between secret and non-secret."[67] Although OSINT under one name or another has been around for centuries, with the rise of the Internet and global communications, the ability to search material at the click of a button has given it much greater prominence and added new components, for example, the blogosphere and social media.

The Interdisciplinary. A commitment to interdisciplinary synergies has become one of the hallmarks of intelligence historiography. The involvement of historians and political scientists, as well as partners in English, sociology, and law has made it a distinctive research cluster. Certain intelligence scholars would consider themselves as "hybrid" or "hyphenated" historians, taking their research and perspectives beyond the academy. Although those who write for nonacademic audiences are still sometimes disparaged, for many in the community, the development of a synthetic literature that connects intelligence his-

The need to relate historical analysis to contemporary problems has led to the establishment of dedicated research centers.

tory and public policy is essential.[68]

History, proponents claim, can be quarried for lessons and can inform current and future practitioners. The most vocal spokesman for the "Public Policy Project" has been Christopher Andrew. From salutary warnings about the dangers of failing to heed the lessons of history, Andrew has moved to the assertion that today's political culture suffers from "Historical Attention Span Deficit Disorder," a widespread belief that the past is "irrelevant to present and future policy and intelligence analysis."[69] For example, had decisionmakers prior to the Iraq War been familiar with failed British attempts to estimate Soviet nuclear capability during the Cold War, they would have realized that approximating WMD stocks is fraught with difficulty and potential intellectual blinkering.

The need to relate historical analysis to contemporary problems has led to the establishment of dedicated research centers, such as the Brunel Centre for Intelligence and Security Studies (BCISS) and the Buckingham University Centre for Security and Intelligence Studies (BUCSIS), that foster links with practitioners and offer degree program? in both historical and policy-oriented contexts.[70] Designed as "career-relevant" degrees, MA programs are invariably filled by those in quest of, or engaged in, security-related jobs. Academics at Brunel and Buckingham double as consultants, providing custom-made academic packages to both professional and corporate clients.

It is pleasing to note that the United States has similar centers to prepare students for careers in intelligence and provide educational tools to the intelligence community. A cluster exists, not surprisingly, among the several universities in the Washington, DC area. Exemplary outside the capital is the Center for Intelligence and Security Studies at the University of Mississippi.

The "Official History." The most common way to connect history with policy is, of course, to write full-scale histories, which analyze all stages of the intelligence cycle and seek to identify trends and themes from past to present. With their access to resources of state, including former agents and personnel, the best people to undertake such a task may be official historians: "Just as intelligence chiefs have to be able to tell policymakers what they do not want to know, so official historians have to be free, on occasion, to tell intelligence agencies uncomfortable truths."[71]

In 2009, MI5 marked its centenary with the publication of an authorized history, written by Christopher Andrew. In 2010, Keith Jeffrey's officially sanctioned history of SIS hit bookshops. It covered the history of the service from its beginnings in 1909 to the early Cold War. Yet not everyone has warmed to such works. As Len Scott and Peter Jackson explain, "For some academics the Ivory Tower should remain a sanctuary and provide a panorama on the world outside."[72] Is it not profoundly unfair, critics ask, that Professors Andrew and Jeffrey have been able to feast their eyes on materials denied to the remainder of their

It should be clear, by now, that this is an exciting time for UK students of intelligence, a subject no longer obscured by secrecy or bedecked with flights of the imagination.

profession? For Anthony Glees, the risk of whitewashing is all too great: "I don't think governments should write their own history. Academics should not become ambassadors or politicians, or work for the secret service."[73]

Christopher Andrew, having twice coauthored officially sponsored histories of the KGB (with the aid of Soviet defectors, Oleg Gordievsky and Vasili Mitrokhin), has been labelled by cynical voices as a "court historian." This is too strong. Andrew and Jeffrey, who throughout their careers have railed against the official position that there could be no middle ground between total secrecy and total disclosure, have to preserve their academic standing at all costs. Sanitizing the historical record now, knowing that documents in question will in due course enter the public domain, would be making whips for their own flogging.

The Countervailing View. A small group of intelligence historians in the UK is engaged in dissecting the seamier side of espionage. The so-called "Civil Liberties Project" (also known as the "para-political" school) conjoins two scholarly agendas.[74] The first is a program for researching intelligence history by way of nonofficial sources, including obituaries, editorials, satirical magazines (such as *Private Eye*), and other cultural miscellanea.

The second is a strategy for writing intelligence history from the "bottom up," moving beyond the intensively cultivated field of high politics to explore the private experience of spies and their most intimate details, such as sexuality, social class, and political orientation. Among the most vociferous proponents of the "Civil Liberties Project" are Robin Ramsay and Stephen Dorril. Their investigations deftly survey the heartless aspects of the secret state, upending established orthodoxy by rendering Western and Eastern European intelligence services as equally contemptuous and equally corrupt.

MI6: Fifty Years of Special Operations was in itself an exposition of the basic tenets of "para-political" approaches. In the preface, Dorril writes: "In order to unravel the activities of SIS, one has to dig deep and sift carefully, in the manner of an archaeologist, but also acculturate, like some intrepid anthropologist, to a strange and secretive society whose intricate social and professional networks are familiar to their members but quite baffling to the outsider."[75] What emerges from Dorril's 900-page tome is that SIS, determined to keep Britain at the top table in an age of postimperial decline, became a law unto itself, implicated in the surveillance and infiltration of dissident groups; the secret funding of propaganda and smearing opponents; and the formulation of "disruptive action," including assassination plots, against such leaders as Mohammed Mossadeq, Slobodan Milosevic, and Muammar Qaddafi.

Few mainstream authors support the "para-political" belief that what the intelligence services do is nefarious and disproportionate to the threat posed by the nation's enemies. Peter Hennessy, in his excellent study of the Cold War secret state and contingency planning in the event of Soviet attack, makes an impressive case for the view that the UK intelligence community, far from being a rogue elephant, comprised a noble band of skillful patriots, and was instrumental in defending the realm and keeping Britain out of nuclear war.[76] In time, he proposes, as new evidence is marshalled on communist subversion and the dirty work of the KGB, the dominant historiographical assumption will probably be that British counterintelligence was grossly inadequate.

British historiography of intelligence—having grown out of traditional British political history, which frankly precludes an interest in the non-Western world—has neglected the role of intelligence services in imperial contexts.

New Directions

It should be clear, by now, that this is an exciting time for UK students of intelligence, a subject no longer obscured by secrecy or bedecked with flights of the imagination. All the omens point to a healthy future. Fourteen British universities presently offer undergraduate or postgraduate courses explicitly on intelligence and security; at least a further dozen offer modules on terrorism and political violence.[77] As the Cold War continues to recede into history, more archival openings are anticipated. Indeed, as Donald Cameron Watt once pointed out, historians of intelligence will always be better off than scholars working on the Greco-Roman period or the Middle Ages.[78]

For the foreseeable future, intelligence will remain a cornerstone of democratic government, tasked to counter the enduring threat from al-Qa'ida and associated networks, but also used increasingly in peacekeeping, crisis management and contingency planning. For those researching contemporary matters, therefore, it is a case of "having to run to keep up."[79]
